Of the \$125,000,000 produced by the mines of the West last year, 10 per cent, it is estimated, went to pay transportation, 37 per cent to mine owners and 15 per cent to smelting works, the remaining 38 per cent having been paid out for labor. It would be difficult to find any other industry that returned during the year 37 per cent to the investors. Aside from these large profits to the smelters and investors, these revenues to railroads and wages paid workmen, the aid mining extends to other industries of the country must be considered, and in this respect it is hardly of secondary importance. It is a universal helper. As a civilizer and populizer of the imperial West, mining has not been awarded its full share of merit, if, indeed, it has met with proper appreciation at the hands of our countrymen, to say nothing of the outside world. The great West owes its wonderful fecundity mainly to its mines.

The teak wood of Hindoostan is almost indestructible. The tree reaches a girth of from 10 to 15 feet, and has a clear trunk of 70 to 80 feet to the first limb. The timber retains its fragrance to a great age. It is a wonderfully hard wood, durable and strong, and once seasoned does not split, crack, warp, shrink or alter in shape. In certain portions of Burmah there is teak 2000 years old. It weighs forty pounds per cubic foot. Teak is used in India for construction, bridge making, sleepers and furniture. It is exported to Europe chiefly for building railway carriages, shipbuilding or making decks and lower masts and for the backing of armor plates on ironclads. It is peculiarly useful for the latter purpose, owing to the resinous matter which it contains and which acts as a preventive of rust, the wood neither affecting the iron nor being affected by it.—Philadelphia Record.

ACETYLENE GAS can be made to yield from three to four times as much soot as is obtained from the same quantity of mineral oil, and the product is much superior to ordinary lampblack, being free from tarry and other objectionable substances. Acetylene black is very bulky and especially adapted for India ink, as well as for inks for printers and lithographers. In one of three methods of manufacture patented in France by M. E. Hubon, the gas is kept in a steel cylinder under a pressure of two atmospheres and ignited by an electric spark or glowing platinum wire, the pressure of the resulting hydrogen which the cylinders must resist being not more than twelve atmospheres. This method gives the theoretical yield of carbon.

IS GOLD MINING stimulated because of general good times? Capitalists who are putting their money into gold mines do not say so. A man working for the Twin Springs Co., on Boise river, Idaho, tells the *World* that he was informed by one of the wealthy men of that company that they would be satisfied with two or three per cent on their investment—that there was so little profit in investments in all kinds of business that moneyed men were investing in gold properties and would be satisfied with small profits.

The plan of Carl Wegner for avoiding smoke consists in the use of pulverized coal and a special feeder which sifts the dust over the entire fire, causing it to be at once inflamed without smoke and with very little ash. This also effects a considerable saving of fuel, and opens a way for utilizing the waste coal dust of mines and storage places; but, on the other hand, it makes grinding necessary when dust from other sources fails.

Mining Summary.

CALIFORNIA.

Amador.

Dispatch: At Plymouth work is progressing at the Wheeler mine. The company is erecting a mill and will have it running as soon as water is available. The Thomas mine is said to be paying. The Pocahontas mine is to have a new mill.

Ledger: The Oneida has delivered over 100 tons of ore to the Zelle mill for crushing. The mine work is being pushed by Supt. Truscott, and is encouraging. The Keystone Co., at Amador City, has shut down twenty stamps on account of the shortage of water.

Record: A crushing of ore is being hauled from the Potazuba mine to the Zelle mill. At the Ballou mine Supt. Porter is crosscutting on the 200 level. The crosscut is in about 100 feet. J. Bernards is taking out good quartz in the Ballou district.

Butte.

Van Light, at the Kellogg mine, near Buck's Ranch, is putting in a Bryan mill. His lowest tunnel taps the ledge at 250 feet.

Work on the new ditch for the Banner mine near Oroville is being pushed. Mgr. Evans expects to complete the work in four months. About forty men are employed. The big pipe formerly used to convey water from the Miocene ditch to the Golden Feather mine will be used in the new line a distance of 3000 feet or more. When this ditch is completed the new mill will be run by electricity generated by water power. Development work continues in the mine.

Register: A contract has been let for a 500-foot tunnel on the Big Betsy ledge. Men have begun work on it. At the Carlisle mine sinking is in progress. H. P. Stow, it is stated, has bought the Shakespeare ledge and will extend the tunnel, now in 2000 feet, 2000 feet farther. So far the tunnel has cost \$12 a foot. When the tunnel is extended under the Shakespeare the face will be about 2400 feet under the croppings. The Denver mine has leased the chlorination works of the Shakespeare mine and will work 150 tons of sulphurets. The Bank of England Con. mine, C. C. Antrim, Supt., has sixteen men employed.

Calaveras.

The old Copenhagen gravel claim at Chili Gulch is to be reopened by McSorley Bros., who have a bond on the property.

El Dorado.

(Special Correspondence).—A strong company has been organized to unwater and test the old Havilah mine. The shaft is something over 600 feet deep. The property has been closed down nearly three years. It is owned by the Joshua Heady Machine Works. The property is 600x1500 feet and is on the mother lode. Up to 1894 the mine had been idle for eight years, after which it was worked a short time by an English company. It is stated that at 200 feet depth the black gouge of the vein is 12 feet wide. It was last worked by A. Harpending. There is a 20-stamp mill on the mine. The property is about three miles from El Dorado, the nearest railway station, at Nashville postoffice. The company is composed of E. C. Voorheis, F. F. Thomas, J. F. Parks, J. Ross Jr. and M. B. Kerr. C. W. Howard Jr. will be secretary. If exploiting proves satisfactory, the Park canal water power will be extended to the mine and perhaps electric power will be introduced. For present purposes steam power will be used. The Havilah mine has a good record as a producer, though systematic work in the latter part of its history was not a characteristic feature. The new company will be known as the Nashville G. M. Co. Placerville, Aug. 10th, '98.

Supplementary to the information given by our correspondent, it may be stated that the Nashville G. M. Co. has, since his writing, been incorporated. The company has bonded the property for four years for \$50,000, without any payments or conditions except that the mine be worked in a systematic manner; and should a sufficient quantity and quality of ore for milling be developed, then, after paying the actual expenses of mining and milling, one-half of the net profits are to be applied on the purchase price of the property. The company has also bonded, from the same owner, the South Extension for five years for \$20,000. M. B. Kerr will be Gen. Mgr. and C. W. Howard will be Asst. Mgr. and Sec. with offices at Nashville. The company proposes, after the preliminary work has been done, to remodel the hoisting machinery, construct a ditch which will give 600 feet head and sink the shaft to 1000 feet depth.

Seventy men are at work on the American river near Placerville and as many more near Coloma. The Levithian mine on the American river is opened and the water running in the wing dam, which is 450 feet long; the main dam is 150 feet.

Inyo.

Bradford & Harris propose operation of the borax marsh at Salt Lake valley. A plant with a monthly capacity of 100 tons refined borax will be built.

The Inyo Development Co.'s smelter on the Sobra-Lane mine, near Darwin, is daily reducing twenty tons of ore.

Inyo Register: The first shipment of bullion, amounting to over twenty tons, from the Darwin smelter was shipped last week. The smelter is running steadily.

Kern.

(Special Correspondence).—G. A. Robrick of this place has bought from J. M. Wangaman the Mayflower group of mines, including the Mayflower, Rose and Plymouth mines, with the 5-stamp mill and other machinery, for which he paid \$45,000.

Bakersfield, Cal., Aug. 10th, '98.

Randsburg Miner: M. Singleton has put men to work sinking in the Windy mine at Johannesburg, from which \$1200 was taken

from nine tons of ore near the surface. After six months of idleness work is to be resumed on the Val Verde mine under the direction of Greggs & Fisher. The output of gold in the Rand district for July was about \$90,000. The total output thus far for '98 is close to \$490,000. July made an advance of \$25,000 over the previous month. Lewellyn & Porter are putting up a cyanide process at Garlock to work tailings. It is estimated there are 10,000 tons. The capacity will be sixty tons per day. Work has resumed on the Little Butte mine. Work on the water tank at the wells of the Yellow Aster M. Co. is progressing. The tank is square, all the front timbers being 6x6 Oregon pine bolted together. The planks are 3-inch redwood. The tank will be ready as soon as the big pump and engine are in place. The Eureka mill people have their cyanide building completed. The capacity of the plant is ten tons per day. At Johannesburg the Red Dog mill is running on ore from the Butte and Minnehaha mines. The Johannesburg Water Co. contemplate enlarging their reservoir to double its present capacity.

Lake.

The Standard Q. M. Co. has levied an assessment of 50 cents per share, delinquent September 12th.

Lassen.

Sloan & Haskell have this season taken out thus far \$22,000 from the old Elk Creek placers. The Badger group are being extensively prospected and a foundation is completed for a 10-stamp mill. The country is overrun with prospectors, and it is locally stated that "not less than 300 miners will be at work in that section next season."

A dredging company is at work close to Susanville, on the gravel and sand beds of the main river. It is impossible to either prospect or work that gravel by any other method than a dredging machine.

Mariposa.

At Hornitos the Campodonico mine has closed down for want of funds to continue development work.

Nevada.

Extensive repairs are being made at the W. Y. O. D. mine, Grass Valley. The shaft will be retimbered and a complete overhauling of the mill will be made.

A ledge of good value has been struck in the Old Home Con. near Blue Tent.

The mill on the Mineral Hill mine near Moores Flat has started and the ore is giving satisfactory results. At the St. Gothard mine, Columbia Hill, development and work on the new 20-stamp mill are pushed. The ore body, though low grade, is of large proportions.

Transcript: The bedrock tunnel being run in the Malakoff mine, at North Bloomfield, with the intention of converting that old hydraulic mine into a drift mine, has reached 380 feet and is in hard ground. When it has been driven 800 feet drifting will begin. Supt. Myers says the company will probably procure a power drill with which to hurry the tunnel along. Thirty-seven men are employed at the Reddik gravel mine, near Nevada City.

Union: La Suerte Co., Nevada City, has resumed work. They are sinking a new shaft on the Klondike claim. W. W. Kirkham is in charge and the ledge will be thoroughly prospected. The shaft on the old Kirkham will be unwatered and driven considerably deeper.

Plumas.

The Bean Hill mine, Spanish Ranch, the past short season yielded well and the company have a force making extensive improvements for future operation. At the Centennial a gravel has been found which is said to yield well. The company operating on Bear creek are making favorable progress sinking their shaft.

Independent: Work on the Lucky S. quartz mine, near Quincy, has resumed. Six men are at work. At the Dunn Bros. quartz mine, Butte valley, the mill is working on good rock. White & Bennett are working their river claim and have several men employed.

Riverside.

The Good Hope mine near Perris is worked by contracts, and no man will be employed excepting those who work in the mill and shaft house.

San Diego.

San Diego Union: Receiver Pauly reports the Golden Cross group clean-up of bullion for July \$50,000. When Mr. Pauly took charge of the mines a year ago there was an indebtedness of \$295,000. This has been reduced 50 per cent. In the thirteen months of his management the mines have produced \$550,000. Besides paying part of the indebtedness every month, he retains a sufficient sum from the proceeds to carry on operations and provide for possible contingencies. The mines at present producing are the Cross, Queen and Crown. The Cross is producing more ore than the others. The Cross and Queen each have a 700-foot shaft. About 250 men are employed.

Shasta.

In a recent cleanup in his mine near French Gulch, P. Schnitzer found one nugget weighing \$90 and another \$200.

The Menzel and Pugh claims near Shasta have a tunnel 150 feet in length. The ore vein is from 8 to 22 inches in width and carries free gold, but the greatest values are in the sulphurets. Extensive improvements are in progress at the Mammoth-Garfield mine at Whitehouse. The mine is owned by S. W. Cheney. He has a contract with the Mountain Copper Co. at Keswick to furnish flux ores for the smelters. The ore is conveyed by a Hallidie ropeway about one mile to the railway, then shipped by rail. An air compressor is being installed.

In the Minnesota mine, near Stella, a ledge has been found that is 7½ feet wide and is said to mill \$40 per ton.

Near Whiskeytown, J. P. Davis has a tunnel 368 feet long, in which he cut a ledge 15 feet

wide that is said to produce from 40 to 90 per cent copper, carrying some silver and gold. Desmond Bros. are taking out a fair-grade milling ore.

Free Press: Hicks, Cooney & Co. have completed their cyanide plant at Castle Garden and have begun operations. They are working a 4-foot ledge. J. Hoadley purchased of R. Bennett a placer claim and a set of sluice boxes on Clear creek for \$3. His first week's labor on the claim netted him a nugget of \$100, besides smaller ones ranging from \$1 to \$5.

Sierra.

The Happy Hollow mine near Downieville is employing four men under D. McKenzie, Supt., who is pushing the tunnel to open new ground.

Siskiyou.

Brown & Reeder have adjusted their partnership dispute in the quartz ledge on Shasta river, the receiver has been dismissed, and the claim is being worked as before.

Journal: Chestnut & Co., who purchased the old Commodore quartz mine on Barkhouse creek, Klamath river, will open this mine on an extensive scale. The company has started a tunnel to tap the ledge and also a tunnel to secure water for power. The Greenhorn Blue Gravel mine is reported paying well. The company gets a good supply of water by pumping the bedrock water and returning it to a tank for second use.

Tulumne.

Good gravel was struck this week in Banner & Co.'s mine, near Columbia. The shaft is down 145 feet. R. C. Davis, in the Sonnet mine, has opened a 3-foot ledge of good value.

Union-Democrat: The Densmore mine, near Columbia, has reached 120 feet depth. The vein is 4 feet wide. Drifts have been run, and the ore throughout is good; indiscriminate milling tests have proven satisfactory.

At the Hope mine, near Sonora, everything is progressing. The tunnel is in 260 feet. The ledge was tapped at 190 feet.

At the Buchanan preparatory work is being done by unwatering the shaft, which is 450 feet deep. Sinking will be resumed. In the Bonanza the incline shaft is down 1800 feet and the vein, from 18 inches to 3 feet wide, has developed into a free-milling property. The company is putting up a mill with a reduction capacity of twenty tons each twenty-four hours. All the machinery for the plant is on the ground and will be running within thirty days. For the present all will be operated by steam, but this will soon be superseded by electricity. The Horseshoe Bend & Tulumne M. & D. Co. are driving a tunnel 175 feet. It is probable that the Sell will be unable to resume operations until the rainy season sets in.

Yuba.

Twenty men are employed by the Government at The Narrows. Open cuts are being made on both sides of the canyon for foundations, the debris being removed by ground sluicing.

NEVADA.

Near Wells the Salmon M. & S. Co. is expending \$3000 in discovery work, sinking shafts to ascertain the extent of the ledges and if there is any sulphate ore at the water level.

Numerous mining locations have recently been made on the western slope of Mt. Davidson, presumably on the probability of the extension of the Suto tunnel westward. If the ore veins indicated by the outcroppings extend downward, the extension of the tunnel will cut them at a depth of from 2500 to 2800 feet below the surface.

W. J. Sutherland thinks that by Oct. 1st, forty of fifty miners will be employed at Candalaria under the superintendency of D. H. Jackson.

At the sulphur mines in Humboldt county eighty men are at work. Ten twelve-mile teams are hauling sulphur to the Humboldt House and delivering twelve to fifteen tons per day. It takes four days for teams to make the round trip from the works. About \$5000 a month is being distributed for labor and supplies. It is said that there are still large reserve bodies of sulphur in the mines, and that operations are being planned on a more extensive scale. The ore now being taken out carries about 45 per cent sulphur.

Work has resumed on the North Star mine, near Coryville. W. L. Bliss is Supt. Near Virginia City electricity is being installed on the electro-peroxygen plant by which the owners propose to handle ninety tons of slimes a day. The Peck cyanide plant was sold for taxes at Dayton to Evan Williams. H. N. Morse of San Francisco, owner of the Gold Park mines and mill, near Austin, has given an indefinite lease on the property to E. B. Hocking and the Goodwin Bros. A portion of the July earnings of the Dexter mines at Tuscarora consisted of a gold brick that weighed \$8800, also cyanides of \$6000 and an ore shipment that yielded \$9000.

At the Ross mine, near Deer Lodge, work has resumed, and building the mill will begin soon. Dr. Nelson will be Gen. Mgr. The Glasgow & Western M. Co. of Scotland, operating at Cherry Creek and Golconda, will immediately build a concentrating mill at Cherry Creek mine, to be in operation before the first of the year, the capacity of the works to be at least 100 tons daily. The Demijohn mine, near Pioche, is turning out silver-lead ore. The mine is under bond to the present lessees. There is a large ledge there, but former owners failed to find it. The ore is being concentrated at the Wheeler mill and two shipments of concentrates have been made.

The Lyon County Times says it is locally reported that the Douglas tailings have been sold to a Montana company that is soon to erect a leaching plant of 400 tons per day capacity, either near the Douglas mill at Dayton or near the tailings reservoir.

OREGON.

English Bros., at the Golconda, at Fruit Creek, Cracker Creek district, near Baker

City, have let a contract for a plant capable of treating 125 tons per day by the chlorine-bromine process. The ore will be crushed in a rock crusher and fall into the bins below, from which it is to be fed automatically into dryers, where, relieved of its moisture, it will be charged automatically into a series of cornish rolls, which crush it to the required degree of fineness. From the rolls the dry pulp is elevated to storage bins, from which it is drawn and fed automatically to the furnaces. The furnaces are connected with dust chambers, in which the gases are condensed. In passing through the furnace the ore is mixed with salt, and the sulphur, arsenic and other volatile bases are driven off into the dust chambers and condensed by a spray of water, giving hydrochloric and sulphuric acid as by-products. The roasted ore, after being cooled, is charged into vats provided with filter bottoms, the acids obtained from the dust chambers allowed to percolate through the pulp, dissolving the copper which may be contained in the ore. The solution is then passed into tanks, where the copper is precipitated by scrap iron in the usual manner. Following the acid leaching, a solution of chlorine and bromine is run through the pulp until the gold is extracted, when the solution containing the gold is run into tanks and the gold electrolytically precipitated upon lead cathodes, which are from time to time withdrawn, and the gold obtained by cupellation. The spent solution, as it passes from the precipitating tanks, is run into potterly cells, in which the chlorine is regenerated by electricity.

Browning & Hannum near Ashland cleaned up \$3700 from thirty-two tons of rock. The Elkhorn M. & M. Co. is running a 1500-foot tunnel on its property at Elkhorn mountain. A. M. Jordan has bonded the Homestake mine near Woodville and will put twenty men at work. La Bellevue mine at Baker City shipped eight carloads of concentrates.

Montreal, Canada, capitalists have purchased the King Solomon mine near Baker City. They propose to spend \$30,000 in developing the property and have already a force at work. If developments warrant a big milling plant will be erected at the King Solomon. The Golconda gold mine is building a chlorine mill with a daily capacity of seventy-five tons. The company employs seventy men.

The Grant's Pass Journal says that good ore has been uncovered in the old Reno & O'Farrell mine, near Grants Pass. Near Jacksonville the Seattle M. Co. is pipping in Watkins district, but will commence cleaning up soon.

A. M. Jordan has bonded the Homestake mine, in Woodville district, and will soon develop the property on a large scale. R. Cook has a force drifting in the Sterling M. Co.'s property and doing well. A carload of concentrates was shipped from the Shorty Hope mine to the smelter a few days ago. Beekman & Huffer have a force running a tunnel to strike the ledge, which has paid well.

Democrat: The Red Boy 20-stamp mill, near Baker City, is almost complete, and the property paid for it before the mill was begun. They have ore on the dump that will pay well. The Golconda is building a fifty-ton chlorine-bromine plant. The Columbia mine has produced since the company took hold some two years ago. The North Pole mine is shipping high-grade ore. The company is controlled by the Baring Bros. of London. Bonanza people brought in a \$20,000 brick at the last clean-up. The California mine, at Cable Cove, has recently put in concentrators and has attained a saving of 80 per cent. J. C. Young, in the Imperial mine, has begun shipment of high-grade ore to the smelters. Near Grant's Pass, J. Sowell in a 140-foot tunnel struck a ledge of copper sulphides carrying a fair percentage of gold.

WASHINGTON.

The Northport smelter has resumed work again after a shut down of several weeks.

The Republic mine produced about \$63,000 worth of ore in July. The shipments to the smelter were 293 tons, averaging \$174 to the ton, making about \$50,900, and the product of the mill was \$12,000. The shipments were limited only by the number of available teams.

BRITISH COLUMBIA.

(Special Correspondence).—The North Star mine was located in '93 and purchased by D. D. Mann and others a year later. In some cases where rich deposits of carbonates were taken out from within the main body of galena the chambers are from 20 to 36 feet wide, 10 feet high and from 100 to 150 feet long. The company has so far not been able to determine the extent of this deposit. The greatest depth attained in the mine is about 110 feet. The value of the ore is from \$50 to \$300 per ton in lead, silver and gold. The company has built a wagon road at a cost of \$15,000 to the Kootenay river, over which the ore is hauled. From the landing the ore is shipped by boats 130 miles to Jennings, Mont., and from there to Great Falls, Mont., by rail to the smelter. Every ton of ore costs \$40 to get it to the smelter. The company declared a 10% dividend July 1st, '98, on a capitalization of \$1,000,000. The Crow's Nest Pass Railway is completed to the Kootenay river, and in another two months will be completed to the Kootenay lake. The Crow's Nest Pass Railway Co. has surveyors in the field locating a branch from the main line to Kimberley, the nearest town, and adjacent to the North Star and Sullivan mines. The North Star M. Co. intends to build a tramway from the mine to Kimberley as soon as the branch line is completed.

Fort Steele, Aug. 10th, '98.

A controlling interest in the Commander mine at Rossland has been sold to a Toronto corporation on the basis of 20 cents per share. The terms were \$35,000 down and the balance in three months. The Commander mine is stocked for half a million. The property has not been worked for six months, but there is \$10,000 worth of machinery on the ground and a shaft has been sunk over 200 feet.

W. D. Turner and Senator Turner have

sued the leaders of the Peyton faction of the Le Roi and the officials of the B. A. C. for \$750,000 for damages alleged to have been caused by the fraudulent conspiring of the parties defendant, which depreciated the value of their stock to that extent.

The Ruth mine near Sandon shipped the past year 5000 tons of ore which netted \$75,000. The galena is said to average 120 ounces silver, 65 per cent lead, and the carbonates run 60 per cent silver and 30 per cent lead. The company employs seventy-five men. There are four tunnels in the mine that aggregate 3000 feet in length, all connected by upraises.

At Roseland the Turner interests in the Le Roi mine has filed a motion in the Supreme Court asking that Judge Spinks' order appointing W. A. Carlyle receiver be set aside.

The Center Star mine near Roseland is reported sold for \$2,000,000 cash to the Gooderham-Blackstock syndicate of Toronto, who own the controlling interest in the War Eagle Company. Of the 500,000 shares of capital stock, O. Durant of Spokane and A. Tarbet of Salt Lake owned 300,000 shares, Sir Chas. Ross owned 30,000 shares and the Patrick Larey estate of Butte most of the remaining 100,000 shares.

Eastern capitalists have purchased the Golden Treasure, White Iron and Vesuvius, near Ymir, for \$10,000. Assays from the surface of this property show values ranging from \$5 to \$75. The development work will commence at once.

At Grand Forks, A. Woodhouse, M. E., has been instrumental in closing a deal whereby a 500-ton smelter may be built at Grand Forks in the near future. The new company is a London corporation. Ex-Mayor Manly has donated 1000 acres of land to the company. The smelter company has put up a guarantee of \$1000 in cash that it will carry out its agreement.—There are 140 men working at the Payne mine, near Roseland. Five feet of ore came into the lower tunnel a few days ago.—The last strike in the Sovereign is 3 feet of ore, assaying 110 ounces of silver to the ton and 78 per cent lead. The strike was made at a depth of 300 feet.

The ore shipments from Sandon for the year ending July 31st were 27,352½ tons. The Payne shipped 13,000, the Ruth about 6000 and the Star 4000 tons. A large proportion of this is concentrates.—In the Elsie mine in the Ymir district good ore has been taken from a 3-foot seam which assays \$32.40 in gold and \$22.16 in silver. The tunnel is in 307 feet.—Sinking the shaft to the 800-foot level in the Le Roi at Roseland has begun and twenty-eight machines are employed underground. It is expected that the shipments for August will amount to 300 tons per day. The capacity of the hoisting plant is 500 tons per day.—The Silver Cup mine owners in the Trout Lake district have received a check for a shipment of ore of eighty-two tons to the Selby Co.'s smelter at San Francisco over and above all charges for freight and treatment for \$8473.03, considerably over \$100 a ton.—In the Center Star at Roseland the shaft, which is down 500 feet, is to be continued and work resumed in the drifts at the 500 level. Shipments from the Center Star last week amounted to 306 tons.—In the Nickel Plate the shaft is down 200 feet and will be sunk 100 feet farther and the property opened at the new level. The yield is 300 tons daily.—In the Slocan the Twin mine has 500 tons of ore on the several dumps. Most of it is concentrating, but some is of shipping grade. The ore runs 70 per cent lead and fifty ounces silver per ton.—The recent strike on the Last Chance shows 2 feet of ore at a depth of 500 feet. A tram is to be put in at this mine.

Dredging for gold has begun on the Fraser river by the Dominion G. D. & P. M. Co. opposite Lilloet. The dredge works with a dipper, the sluice boxes along the sides extending behind, so as to dump the tailings as far as possible from the scow. It is 60x30 feet. Another dredge is being operated by the Northwest G. M. Co. on the Quesnelle river, thirteen miles above Quesnelle. It is run on the bucket system, sixty buckets, every other one being armed with teeth, to tear up the bank, the next being smooth rim. The gravel is raised and dumped into the sluices.

ALASKA.

Richard Lowe is regarded as the Bonanza King of Bonanza creek. His mine differs from others in respect to the manner in which it is worked. The Lowe mine is an open cut and the gravel is shoveled straight into the boxes without having to thaw the ground out as is done in most cases. Local reports say: "He made one cleanup from the boxes of \$41,000 in thirty-seven hours."

A Vancouver, B. C., dispatch reports the arrival of the Coquitlam, the latest boat from the north. The captain "confirms the news of the big strike on Pike creek. He says the stories of the rush to Tagish lake have not been exaggerated. Miners at Skaguay have simply gone crazy. The finds are represented to be something stupendous. People are throwing everything aside and stampeding for the scene of the latest excitement." Skaguay, Dyea, Juneau and Wrangell are partially deserted. J. Kelley, a druggist at Skaguay, showed a letter to Purser Smyth from his partner, who has been at Pike's creek since the first strike. He says:

"Drop everything, no matter at what sacrifice. Come quick. Enormous strike here. Probably the richest placers in the world. Pike's creek is staked for sixteen miles on either side, but there are two other creeks here within twelve miles which are thought to be just as rich. Gold commences at grass roots, and is of uniform richness 5 feet down to bedrock, running from \$2 to \$10 a pan. There must be 8000 people here in tents."

All the returning Klondikers are going back on the double-quick to Pike's creek, taking a week's provisions. All the prominent Canadian officials reached the scene of the strike several days ago. They have written back to the coast that the strike is the richest yet

discovered. They put the average pan at about \$2.

That kind of talk a little earlier in the season would have started a good many from California, but just now, no matter how glittering the reports, the transportation companies will be unable to create a stampede or recoup their season's losses.

At Seattle, Wash., on the 17th, the steam schooner Rival arrived, fourteen days from St. Michaels, with 100 passengers from Dawson City, among them some few miners with gold dust estimated at about \$100,000. N. H. Sylvius, a pioneer of the Yukon, says that when winter sets in there will be a general exodus from Dawson, as the country cannot support the people there. Men are seeking employment at \$5 per day. Wages have dropped from \$1.50 to 70 cents an hour. Even at that price only a few can obtain work. There is much sickness at Dawson and the hospitals are full of dysentery, which is the chief complaint. This is not confined to Dawson, but prevails along all the creeks.

Indiana capitalists in the Berners Bay district, known as the Alaska G. M. Co. of Indiana, have acquired title to seven claims and a large force is at work erecting buildings to accommodate seventy-five men. In addition to this, a tunnel 7x8 feet has been driven through the companies' properties. A road has been built for half a mile and fifteen bridges erected. The present work consists in driving the tunnel 1500 feet to tap the farthest ledge and give stoping ground for 2000 feet. Several of the veins have been cut and many more which appear on the surface will be intersected. A large stamp mill will soon be placed. The property is rapidly being brought into a productive condition.

IDAHO.

At Florence the San Joaquin mine continues to improve with depth. The vein is 16 inches and assays \$40.40 in gold and three ounces of silver per ton.—At Kendrick this has been a prosperous season for the miners, a majority of them having made paying cleanups. They have had a good supply of water. C. E. Rummel cleaned up \$1700.—At Murray the Chest mill has started ten stamps on a month's run of fair grade ore.

At Mullan the Morning mill is completed. It has a capacity of 800 tons of crude ore daily, which is about 250 tons more than any other lead-silver concentrator in operation.

J. K. Fleming bought the Lucky Boy quartz mine at Idaho City last week for \$20,000, paying \$5000 cash, the balance to be paid in monthly installments.

Work has resumed on the Blue Bird mine near Idaho City under bond.—In the Iowa and Yellow Jacket mines at Quartzburg large ore bodies have been opened and the output is more than the 10-stamp mill can handle.—Work has resumed at the Summit mine near Idaho City.—O. Chellis, while the water lasted, made \$15 a day this season in his placer mine near Challis.—The first cleanup this season at the Buffalo Bill placer mine near Elk City amounted to ninety pounds of gold.

At Wallace men are excavating for the foundation for an extension to the Standard mill. The new building will be 23x28 feet. A crusher will be put in.

The flume of the Twin Springs H. Co. near Idaho City is 6 miles long 5 feet deep and 6 feet wide. The pipe line is 4000 feet long and 4 feet in diameter. Seventy boxes, each 12 feet long, will be put in. Six hydraulic chiefs will be at work next year under heavy pressure. In one claim the pressure will be 315 feet, in another 275 feet, and in the third 125 feet. In the Twin Springs claim the gravel bank is 100 feet deep, in the Big Flat claim 60 feet, and in the next 30 feet. The ground carries gold from surface to bedrock and all of it will pay with the supply of water that will be used. This year the claims were no more than opened. A derrick is being constructed, to be run by water power. An electric light plant and hotel will be put up this fall. Additional ground thirteen miles above the camp was purchased this summer by the Twin Springs Co., on which work will begin soon on a big ditch, and a wagon road will be constructed from the Twin Springs camp to the recently purchased placers. The monthly payroll of the company the past spring and this summer has been \$14,000. A telephone line was completed in June from Boise to the camp, a distance of forty-two miles.

Idaho Statesman: Work has been completed on the Basic Co.'s ditch and flume in Grimes creek near Boise. The ditch is eight and one-half miles long, will carry 1200 inches of water and produce 800 H. P., which is to be used in operating dredges in the Basin.—The Placer-ville dredge is finished and ready to run as soon as power can be furnished for it. The Centerville dredge is on the stocks, rapidly assuming the shape of a boat. So far as dimensions are concerned it will be a duplicate of the first dredge built by the company, but as the ground in the vicinity of Centerville, where it will operate, is not so deep as at Placer-ville, its reach will be a few feet less. The Basic Co. expects to land the last of its electric machinery at the power house before the end of August.—Near Albion, J. Comerford in the Badger mine is sinking a shaft and taking out good ore. About 100 sacks are ready for shipment.—Work will be resumed on the Bimetallie mine, Conner Creek district, soon. Good ore is taken from this claim.—The Comora people, in the Conner Creek district, have completed the raise to the surface from the end of the long tunnel for air, and will continue work on the tunnel.

UTAH.

It is estimated that there are 200,000 tons of tailings at the Mercur mill, Mercur. Mgr. Dern has under consideration the building of a leaching plant to extract their values.—At Fort Duchesne the St. Louis Gilsonite Co. is making regular shipments to Eastern markets.—M. Gibson, Mgr. Geyser-Marion at Mercur, recommends development of new

ground in which ore has been discovered that assays \$5 per ton and which would give the company an output of 200 tons a day.—The Galena mine, at Fish Springs, made a shipment last week of high grade silver and lead ore.

Pres. R. C. Chambers, in his report on the Daly mine at Park City, shows that Dec. 31st, '97, there was cash on hand \$36,199.37, that during the year dividend No. 77 of \$37,500 was paid. From the sale of crude ore \$19,923.69 was derived, while from bullion \$80,067.35 was obtained. In the same period 5369 tons of ore, of an average value of \$17.04 per ton, were milled, while the cost of extraction was \$3.71 per ton. From the ores milled and those marketed in native form the company realized \$162,667.85. The report concludes that since the opening of the mine 275,321 tons of ore have been mined; that from it 11,373,317 ozs. silver and 11,491 ozs. gold were derived; that the whole sold for \$9,579,229.86, and that dividends amounting to \$2,925,000 have been distributed.—The Last Chance Co., at Bingham, is said to have closed down.—The Blue Bird of Gold Mountain made a shipment last week of a carload of high grade gold ore.

Work has begun on the Yankee, at Eureka, and a favorable showing is reported; the tunnel has reached 600 feet.

At the Martha Washington mine, Silver City, drifting for the vein from the 350-foot level is going on day and night.—At Belknap in the Loring mine a ledge is being developed that is 6 feet wide and yields \$9.60 a ton.

—Ore shipments from Park City last week amounted to \$1,553,680 pounds.—Tintic shipped fifty-one cars of ore and twenty-five cars of concentrates.—From Silver City were shipped thirty-two carloads of ore.

The Grand Central mine at Mammoth is outfitting three cars of ore a day. New machinery at an outlay of \$12,000 is being put in. The company has a reserve fund of \$100,000.—The search for ore in marketable quantity on the Comstock at Park City has been resumed under the direction of M. Dusseldorf. Several thousand feet of exploratory work has been done and in spots some high grade ore has been found.

The Starlus Co. at Bingham is sinking a shaft on the Amanda mine, from its old upper workings. It is down 30 feet, all in quartz carrying 5 to 5½ per cent copper and \$1.50 in gold.—Supt. Johnson has completed the survey for a wire rope tramway for the Highland Boy mine to the depot, which may be adopted in lieu of the proposed railroad.—Wilt & Heaton have run 125 tons of 10.40 ore through the Heaton jigs. The product is four in one, and shows 40 per cent lead. They will have between sixty and seventy-five tons concentrates from 250 tons.—E. Hill & Co. will extend the tunnel of the Washakie claim 100 feet. It is in 400 feet on the vein which shows 21 inches of good milling ore.—A 16-inch streak of shipping ore has been struck in the Golden Opportunity new ground.—Work has resumed on the North Star mine near Coryville.—The Spanish mine at Bingham marketed eighty tons of ore last week.

The Grand Central mine, Tintic, is turning out seventy tons of ore a day.—The Silver King at Stockton, which has been idle several years but recently reopened under lease by Gemmell & Cunningham, made its first shipment last week, which yielded 60 per cent lead and forty ounces in silver per ton.—S. Newhouse, who returned from the East this week, announces that contracts will be let for the construction of eight miles of new railway, five miles to connect Bingham and the Highland Boy mine with spurs and sidetracks, and three miles from the Rio Grande Western tracks at Murray to the smelter which is to be erected near there. Work will begin soon and be completed this fall.—The first shipment was made this week from the Daisy mill, of 200 pounds of auro-cyanides, to be followed by a like shipment in two weeks. The Tribune says that in the starting of the Daisy mill the mines of West Dip appear as a new factor in the Mercur district. In a general way the ores there are the same as those on the east dip of the big zone, but as yet there is not a suggestion of anything arduous in connection with them. The ores of the Daisy average about \$6 per ton and as those of the Sacramento were handled at a gross cost of \$1.40 per ton last month, there is no reason to believe other than that Mgr. Mayne will in a short time accomplish the same thing. With the production of auro-cyanides at the Daisy the number of mills at Mercur from which that product is coming is increased to five.

Mercury: The Overland at Mercur continues to develop well. The shaft has cut into the vein 11 feet, all of which is good milling ore. Throughout the mine the vein and values are proving large and uniform and of a quality yielding to the cyanide process.—Tests of the tailings at the mill at Manning have been successful and the dump can be treated at a saving of \$1 per ton. There is estimated to be 200,000 tons which would keep the mill running for two years and add \$9000 monthly to the net earnings of the company.—Work on the old Fred mine has been resumed. The shaft is being retimbered. Extensive development work will be done this season.

MONTANA.

The Golden Scepter G. M. Co. of Quigley is to adjust and pay outstanding claims. The new concern, the Majestic G. M. Co., will complete the mill and electric power plant and operate the Jumbo mine.

Near Nelhart the Big Seven mine paid \$60,000 in dividends in three months. The ore is partly sorted and sacked in the mine, then brought to the ore house where sorters break the chunks and reject all waste. Then it is hauled seven miles for shipment. Thirty-five men are employed in the mine.

The June output for the Montana M. Co., near Marysville, was 2930 ounces of gold and 15,700 ounces of silver from 6211 tons of ore crushed, and 11,591 tons of tailings. The estimated value of the crushings is \$43,400, and of the tailings \$23,800; the cost of treating the

tailings was \$13,443. The total expense was \$58,000, leaving a net income of \$9200.—The Kentucky-Montana M. Co., near Helena, has leased its properties to Missoula parties, who have transferred it to the Vermillion M. Co., a new incorporation with \$100,000 capital. The new company took hold Aug. 1st. The property is well developed. Large ore bodies are exposed and the rock can be handled economically.—The Bimetallie mill, at Phillipsburg, has been running fifty stamps since June and twenty additional stamps were started last week. The full 100 will be in operation soon. There are about 800 men at work. Shipments of bullion are made with old-time regularity. Last week a ton of silver was shipped. The improvements that have been made in the mill have been extensive. The consolidation of the two companies and the introduction of new processes have made it possible for the plant to be operated at a cost that is said to be much less.

Two Libby prospectors made a location last week; another man came along, took a copy of it and, says the Libby News, here it is, letter for letter and line for line, just as it appeared on the discovery post:

July 27, 1898

Located by

Jake Teters and

A. Rosecrance.

Ft. 700 Southward

Ft. 800 Northward

Ft. 300 from Sender

Stake Each Side

None as the Good A Nuf.

That is all there is to it, and while it is not in the usual form, the News believes it is a good location. The five essentials for a legal notice are there, the date, the names of the claim, the direction of the lead and the amount of ground claimed.

T. Ash, Mgr. Great Eastern mine at Castle, has suspended operations and paid off all the miners. It is thought that the mine will be leased at once and operated again.

The Bell mine at Pony is opened by four tunnels at a depth of 1206 feet, and is running fifty stamps treating 100 tons of ore a day, and shipping seven carloads a week that return about \$100 a ton.—At Winston the Diamond Hill mill continues forty stamps in operation and employs thirty men. The ore that was paying only \$1.50 when the mill closed down last summer is now being treated so successfully that it is yielding \$15 per ton.

—At Virginia City D. W. Chambers, representing the Butte Co. that bonded the Fortune group, will soon commence work on a large scale.—The Mammoth G. M. Co. of Coloma, was attached last week by Larabee Bros., bankers of Deer Lodge and W. E. Hosmer, of Boston, president of the company, for \$25,000. The Larabee Bros. account is for an overdraft in their bank and Hosmer attaches for money he has advanced. The Mammoth mine, under the new company and under the management of A. B. Brown, has been running eighteen months, during which time \$100,000 has been sunk.

At Glendale the Hecla Con. M. Co. has found new ore bodies of lead in the Atlantis, Hecla, Trapper and Cleve mines. The company for a long time has had good grade silver ore, but was unable to reduce it without fluxing material. The old lead ore bodies gave out necessitating the closing of the smelter. The silver ores were not sufficiently high grade to ship. The hope of the company was in finding new supplies of lead ores and development was continued with the above results. The company employs 200 men and will increase the force when the second furnace is started up. Last month the payroll was \$30,000, twice as much as for July, '97.

The Gilt Edge mine near Lewiston is treating 107 tons of ore per day.

F. A. and A. P. Heinze filed at Butte a suit against the Boston & Montana Co. of Montana and the Boston & Montana of New York, for \$250,000 damages and an additional \$100,000 for ore alleged to have been mined from the Dayton lode claim.

Anderson & Moore, near Libby, shipped a car of ore that assayed \$338.60 and \$109.20 per ton. The pay streak averages 14 inches in width.—J. Chase made a shipment of a carload of ore from the Lost Cloud mine that carried 260 ounces of silver and from \$1.50 to \$3.50 gold per ton.—The Moulton mine at Nelhart has been unwatered to the 500 level and the pumps have been lowered to continue work.

Butte Miner: The talk of operating the Butte & Boston properties independent of the Boston & Montana and treating only Butte & Boston ore in the Butte smelter and concentrator has died out to a great extent. It is not only thought by mining men in Butte that the smelting plant will ever be operated by the Butte & Boston Co. unless the Michael Davitt mine should prove a bigger producer than it has in the past. The one side of the concentrator is being operated on Butte & Boston ore, of which from the various properties about 200 tons a day is being hoisted. The average grade, however, is low and it is only occasionally that Butte & Boston ore is sent direct to the smelter.

SOUTH DAKOTA.

The company working the placer grounds near Mystic is operating three centrifugal pumps. The method of working the gravel is by sinking shafts. The gold output is satisfactory.

MICHIGAN.

The annual report of the Calumet & Hecla Co. shows its machinery contracts on hand are larger than ever before, amounting to \$855,000, which is \$300,000 more than a year ago and \$200,000 larger than two years ago. It is building a new coal dock and is arranging to do away with the hand-pushing of cars through the levels by the introduction of power through rope transmission. It is having built seven drum cylinders, designed to carry 8000 feet of wire rope, which will reach the limit of the Calumet & Hecla ownership upon the

inclined of its vein. This order amounts to \$300,000 and follows the delivery of three similar cylinders. As mining operations are deepened, larger and more powerful machinery is required. The Corliss Jumbo engine, the largest engine in the world, has been ordered replaced—or, rather, placed in reserve—the moment the engineers reported they could build an engine whose increased efficiency would in three years pay its cost. The Calumet & Hecla in its business operations more resembles a manufacturing company than a mine, but, of course, as a manufacturing company, unless additional ground is purchased, it cannot go on forever with present Calumet & Hecla richness.

ONTARIO.

The shaft on the Emperor mine, at Mine Center, is down 100 feet, and tunneling has begun to meet a 15-foot vein found 75 feet distant.—The Golden Star shaft is down 300 feet and drifting is done from the third level. A stamp mill is being built. Ninety men are employed day and night. Over 4000 tons of good ore are on the dump, and by the time the mill is ready another 300 tons will be added.

COLORADO.

BOULDER COUNTY.

The D. D. Co. near Salina is producing ten tons a day of good concentrating ore.

CHAFFEE COUNTY.

The Cleopatra, Whitehorn district, shows a foot of solid ore, out of which samples run from \$50 to \$75 in gold.

CLEAR CREEK COUNTY.

Leasers in the Little Annie near Idaho Springs have found a new body of ore and are getting out a shipment that will run over \$100 per ton. It carries copper in addition to gold.—The Newton mill has 500 tons of ore ready for treatment.—At the Josephine considerable development is under way. Most of the product is concentrating ore.—Bigger & Co. are drifting in 2 feet of smelting ore, while other leasers have a body of lead and copper ore.

DOLORES COUNTY.

The Sawpit Co. at Sawpit has cut a body of ore that runs \$80 to the ton in gold, with a pay streak averaging 2 feet wide. The company proposes to build a mill.—The Enterprise mine, at Rico, will resume shipments this month. A large force are blocking out ore bodies, and the tunnel is being pushed to open the large low-grade ore bodies in the Laura claim.

EL PASO COUNTY.

The Victor mine management proposes continuing the shaft to the 1000-foot mark. The shipments from the mine continue the heaviest in the camp.—The block formerly known as the Sweeney lease at Victor has been sold to the Mary Cashem G. M. Co. The new owners will at once put in a compressor, sink the shaft and thoroughly prospect the claim.

Lessees of the Specimen have shipped some of the best ore shipped from that property. It consisted of half a ton of ore, estimated at 50 cents a pound, three tons of four-ounce ore from the Hampshire & Lowe lease, and two tons of ten-ounce ore from the Sellers & Lowe workings.—Lessees on the Los Angeles are making steady shipments. Last month about 500 tons of ore were shipped.

—The Creston Leasing Co., Cripple Creek, is shipping a carload a day of three-ounce ore. Three cars estimated at six ounces are on the road to the Leadville smelters.—A big strike has been made in the Kitty mine, which, after taking out \$100,000 in high grade stuff, dropped into a low-grade proposition. Recently at the 400-foot level another rich shoot fully 5 feet in width was entered.—The Pharmacist mine at Cripple Creek has closed down.—The Columbine-Victor tunnel at Cripple Creek has reached 1800 feet and when completed will be 5000 feet, and will connect with the Gold Coin mine.—In the Wild Horse claim, Cripple Creek, fifty tons of ore were hoisted that will average 500 per ton. The shaft is all ore and carries a pay streak 7 inches wide of high grade. The property is being worked by parties who have a lease and bond for \$10,000.—The Lucky Guss, Victor, made a strike last week of a 3-foot vein of high grade ore in the 700-foot level, and it is reported that the new find exceeds anything yet found in the mine. The upper levels are being worked by several sets of lessees. These old workings yielded 150 tons of ore in July, which netted a fair profit for the leasers and a good royalty for the company.

The Mollie Kathleen, Cripple Creek, has a daily output of five tons, the ore averaging \$25 per ton, but so easily handled that it leaves a good margin. Three hundred feet are worked by lessees, the balance by the owner.

EAGLE COUNTY.

From Battle Mountain district seven carloads of ore were shipped last week.

The old stamp mill at Fulford is running on ore from the Adelaide mine and turning out good concentrates. The ore is being taken out as fast as the mill can treat it.

FREMONT COUNTY.

At Canyon City last Wednesday at noon the Canyon City & Cripple Creek Power and Electric Light Co.'s plant, designed to furnish power and lights for the mines and mills of the whole Cripple Creek district, about forty miles distant, was put in motion, Gov. Adams pulling the lever in the presence of capitalists and mining men. The plant is established here on account of the coal beds surrounding the town. Most of the mines of the Cripple Creek district are already equipped for the use of electricity in lights and power, and it is estimated that a saving of 25 per cent will thus be made in the cost of operating them.

GILPIN COUNTY.

(Special Correspondence).—The Gregory Con. Mines Co., capitalized by New York and Boston parties, has expended \$128,000 in de-

velopments and improvements within the past eighteen months. Their property is at Blackhawk, and consists of the Gregory and Bobtail lodes, both of which are developed. Over the former lode is their 145-stamp amalgamation and concentration mill, seventy-five stamps of which are running. From a point near the mill an incline shaft runs 1700 feet, angle 45°, landing on the main level at the 900-foot level. On this level drifting and stoping have been extensive. From the same level a vertical shaft sinks 200 feet on the vein, from which drifts and stopes run both directions in bodies of high grade ore of unusual width. Near the base of the incline above mentioned a crosscut tunnel starts at right angles to the Gregory lode, running 1300 feet southward to cut the Bobtail lode, which was developed years ago through another property. This underground tunnel cuts the Fisk vein and various blind leads in its course and will cut the Bobtail at 350 feet below its present workings and at 900 feet below the surface at the mouth of the old tunnel. If calculations are correct, the breast of the new crosscut tunnel is within a few feet of the Bobtail lode. The workings at this depth are pretty well surfaced with water, which is kept out of the way by a compound duplex steam pump, with a capacity of 800 gallons per minute, stationed at the bottom of the incline, 900 feet below the surface. This pumping power not only drains this property, but incidentally the Fisk, Cook, Sleepy Hollow and other adjacent properties. This work has been done under the superintendence of J. C. Dickey.

In the Cook mine the main shaft has reached a depth of 365 feet. The 100-foot level has been run 500 feet from the stopes in which regular shipments are being made. The 200-foot level goes in 150 feet. The mill ore yields from two to four ounces per cord. The smelting ore runs from \$7 to \$8 per ton net. About 1500 tons per month of milling and smelting ore are being handled.

WASCOOT.

Central City, Colo., Aug. 12th, '98. The shipments of ore from the county for July, over the Gulf railroad, aggregated 279 carloads; shipments for the same month last year were 280 carloads, and the shipments show that the ore production of the county for the present year is keeping close to that of last year, which was the most prosperous in its history.—Lake & Son continue development in their Barnes mine on Quartz Hill, and make monthly shipments of fifty tons of fair concentrating ore.—Returns from the last ore shipments of the Chaffee-Notaway mine at Central City netted fourteen and three-quarter ounces gold per ton.—The Jones mine at Nevada has resumed work cleaning out and repairing the shaft preparatory to sinking and driving the levels. A mill run test on the dirt ran \$10 per ton and a shipment of smelting ore yielded \$18 per ton. The property has been idle a long time.

HINSDALE COUNTY.

The St. Jacobs mine, at Carson, though well equipped has lain idle for six years pending litigation. The owners are having the water hoisted and propose to bring it up to its old record as a producer of good ore.

Reporter: A new industry is about to be inaugurated near Lake City in the concentration of zinc ores. It is said to be profitable to concentrate the zinc ores from the tailings which run from the lead concentrates. A carload has been shipped as a test to the zinc-lead smelter at Canyon City, which will run over 40 per cent metallic zinc, for which the smelter offers a good price.

LAKE COUNTY.

The Big Johnny mine near Weston Pass is leased to Philadelphia people represented by W. P. Garrison. The Big Johnny is developed by a 500-foot tunnel and a 125-foot winze. The bottom of the winze was looking promising and the work had begun on a station when the porphyry began swelling and a cave occurred.—The Rio Grande branch road to the Ibox property, Leadville, will soon be well under way. The line will be ten miles long and will pass the Resurrection, Dollie, Sedalla and several other big gold producers. The road will be completed early in the fall, and it is estimated that it will cost \$100,000.

LA PLATA COUNTY.

At Junction the Golden Rose mine is a regular semi-monthly shipper.—The American Boy tunnel will soon tap the vein.—The Schrader claim is taking out shipping ore.

OURAY COUNTY.

The ore shipped from Ouray in July was 312 cars, an increase over that of last year.

PITKIN COUNTY.

The old Taber properties near Ashcroft are reported sold to M. H. Day. He will at once begin work on the mines and will also build a concentrating mill.

SUMMIT COUNTY.

The Nettie B. mine, Ten Mile district, in getting into shape to output a large amount of ore. The machinery is in place, and work will be pushed with the intention of reaching a daily output of not less than fifty tons. The ore is a fair grade sulphide and carbonate.

SAN JUAN COUNTY.

From the Little Maud mine, near Silverton, thirty-eight sacks of ore were taken that yielded \$250 a ton gold.—The Ridgway mine is shipping two cars a week, which net \$900 per car. The output will be increased. The management have started another drift 150 feet below the present lowest drift, and when this taps the vein there will be opened up a stoep which it will take a year to exhaust.—The Moore smelter is running successfully. Eight to ten tons of crude ore are being put through every twenty-four hours. A carload of matte, the product of five days' run, was shipped to the sampling works for a test as to its values.—The average value of ore in the Irene mine, at Silverton, is 388 ounces silver and 8.10 ounces gold per ton.—The Esmeralda mine is shipping two cars a month of \$80 ore. The vein averages from 6 inches to 2 feet.—

The Green Mountain mine shipped a carload of ore that yielded \$5 gold, eighteen ounces silver and 51 per cent lead per ton.

Standard: The 114-foot extension of the North Star-Yellow Jacket 900-foot tunnel at Silverton, which has been driven to tap and drain the Black Canyon shaft and the lower drifts connected therewith, has been completed. The water was met by a 5 foot drill hole, causing a stream 60 feet in length to shoot out. The shaft tapped is 250 feet below the upper level and was broken into about 30 feet above the bottom of the sump. Through this system of drainage, thousands of feet of ground will be opened up which otherwise would have lain useless.

The tramway building of the Silver Lake mine is said to be the largest of the kind in the world. It is 98 feet long, 49 feet wide and 72 feet high; has a capacity of 10,000 tons; has four floors and eight ore bins. The tramway is 15,000 feet long, has twenty-four towers, the tallest being 22 feet high. A 15 H. P. dynamo furnishes the power. It is working smoothly and dumping concentrates into the bins steadily.

SAN MIGUEL COUNTY.

The Keystone placer mine, near Telluride, has resumed work. Shafts will be sunk to bedrock and a hydraulic elevator installed.

NEW MEXICO.

(Special Correspondence).—The Hearst people are spending large sums of money in development work and in making extensive improvements at Pinos Altos, and as a consequence the camp is booming.

A big copper strike has just been made in the Carrizilla district, not far from Deming. The vein is nearly 60 feet wide, and a mill run on ore taken from the full vein without sorting shows a return of 28 per cent copper and fifteen ounces silver.

A contract was let last week for the building of reduction works in the San Andres district, in Dona Ana county.

The Bennett-Stephenson mine in the Organs, not far from Las Cruces, is now being operated successfully. The concentrator is running night and day, and the ore is steadily improving.

The Surprise at Hanover is now working profitably on lead ore, which is sent to the El Paso smelter.

Hawley Fitch, the new owner of the Ajax mine near Elizabethtown, is putting the property in first-class condition. This was formerly an excellent producer, but for some time has been in bad order.

The well-known Lincoln-Luckey, in the Golden district, which was for a long time tied up in litigation, is now shipping considerable quantities of fine ore to the Colorado smelters.

The heavy machinery recently put to work on the placers in the Moreno valley is doing excellent service. The steam dredge is bringing up the richest gravel yet found in that district, and a nugget worth \$5 is no longer a rarity.

The famous Aztec mine, in the Ute Creek district, is again in active operation. This mine has a record for over \$1,000,000, but owing to legal complications has been lying in a dormant state for a long time past.

The Bandana, in the Moreno district, has produced over \$100,000 in the last two years, with a depth of less than 200 feet.

The Empire, in the Black Copper district, has recently developed a large body of very fine ore, with occasional pockets running as high as \$1000 a ton.

In the Cochiti country there is greater activity now than ever before, and the future of all the camps in the vicinity appears to be very bright. The big cyanide plant in Colla canyon—the largest of its kind in the United States, except the great plant in Utah—is now in operation and thus far everything has gone on satisfactorily. Although numerous tests had been made with the ore before the work was commenced, the practical operation of this important enterprise is still an experiment, and it will be necessary to wait a week or two yet before actual experience places the success of the work beyond any room for doubt, and then if the result meets the expectations of the owners, the whole Cochiti country should join in a great celebration of the event, for the success of this enterprise means that Cochiti is to take rank as one of the greatest mining regions on the continent. Those who are acquainted with the district are fully satisfied of this already, and as soon as it shall be demonstrated by the new mill that these vast bodies of low-grade ore can be worked profitably, the public will know it. More work is being done in the district this year than was ever done there before, and more good ore is being shipped, but for every ton that will bear shipping there are forty tons or more left on the dump, and how to get the values out of this is the question that the new mill is expected to answer.

Albuquerque, N. M., August 10th, '98.

The Miners' Dream mine near Questa has a 135-foot shaft and drifts. From the dump of 500 tons assays have given \$38 in gold.

ARIZONA.

The Pinto Creek M. & S. Co., near Globe, from a ton of Yo Tambien ore, received 19.63 per cent copper \$8 in gold and four ounces in silver and from Winona ore 14.20 per cent of lead, \$5.60 gold and one and one-half ounces silver. Supt. Calder is centering the work on the Yo Tambien and has the shaft down 132 feet.—The Fortuna mine, in Yuma county, is 600 feet deep. The monthly output of gold is \$40,000.

Development work is progressing at the King of Arizona mines with a small force. The water is packed by burros from Tres Alamos, twenty miles from the mines, and this is thought to be uncertain. The mines look good, and only water is lacking to make the property a success.—Gandolfo & Sanguinetti's lead mines at Castle Dome employ forty men, and quantities of good lead ore are being taken out. These mines have improved

with continued development. The ore is freighted to Gila City, then shipped to San Francisco.

The steam wagon brought the first consignment of ore to the smelter at Williams from the Grand canyon copper mines last week. The load weighed forty tons.—A strike has been made in the Nellis group of mines and a large body of ore is being uncovered.

A carload of copper matte from the Nacosari mines has been brought up to Bisbee to be treated at the Queen smelters. Heretofore the matte has been shipped to Baltimore.

Bisbee trib: An authority on Arizona copper mines says that the production in the Territory this year will increase fully 50 per cent. It increased 25 per cent in 1897. The United Verde mine, owned by W. A. Clark, has a monthly output of 3,000,000 pounds and is probably the largest producer in Arizona, but there are other mines that produce 2,000,000 pounds per month.—The Fortuna mine in Yuma county is opened to a depth of 600 feet, an evidence that lodes in Arizona go down. The mine is a steady producer, the monthly output of gold being from \$40,000 to \$50,000.—The Copper Queen Co. are erecting another large ore bin. The old bins were insufficient for the amount of ore hoisted. A new furnace has arrived to take the place of the last small one. The company are increasing their output, which is said to be over 2,000,000 pounds per month.

Owners of the Marcus mine near Stanton will soon commence work.

MEXICO.

The new Wyman shaft on La Colorada mine at Minas Prietas, Sonora, is going down rapidly and has cut the ledge. It is from this shaft, which is triple compartment, that the Don Ignacio property will be worked.

SOUTH AFRICA.

J. R. Williams of Johannesburg, in discoursing on mill practice, says of the treatment of slimes: "This, in the ordinary sense, is a non-leachable product. By non-leachable I mean that it is not practicable to percolate solutions through it. The mode of treatment adopted for this product may be briefly described as follows: The slimes with a large excess of cyanide solution are pumped into any suitable vat or tank, where they are allowed to thoroughly settle, and the clear solution drawn off through a perpendicular series of side cocks, or, preferably, through a decanting pipe which is fixed on a movable joint and can be lowered at will until all the clear solution is drawn off. In cases of rich slimes, it is found necessary to transfer these settled slimes into another tank, which is effected by sluicing with cyanide solution through centrifugal pumps, and the process is repeated. The gold in these solutions is not amenable to the method of precipitation by the ordinary zinc process. Precipitation in this case has to be effected by the Siemens-Halske process, which may be briefly described thus: The solution is allowed to flow through boxes having alternate sheets of iron and lead foil. An electric current is passed from the iron to the lead which precipitates the gold on the latter. This, when required, is removed from the boxes, melted into bars, which carry from 1/2 up to 7 per cent of gold, and is usually sold to the Rand Central Ore Reduction Co. for refining. The combined processes of the mill, cyanide works and slimes plant extract from 90 to 95 per cent of the total gold contents of the ore, which, to the best of my knowledge, far surpasses anything done on any other gold field in the world, and at a cost not exceeding 7s per ton."

President Krueger and his executive have decided to have the entire country of the South African republic surveyed geologically. The work is to be carried out under the supervision of a citizen of the republic, Dr. G. A. Molengraaf.

The recent flotation of two of the Consolidated Gold Fields properties, the South Rose Deep and the South Goldenhuis Deep, and the immediate commencement of work on them seems to augur an increased activity in the mining market. It is also rumored that the mine of Eckstein will shortly commence work on the Robinson Central Deep. The Pioneer mine, which has paid its capital back about twelve times over has declared a dividend of 375 per cent. The mine is a small one, twenty claims, and will be exhausted in about eight months, but there is a reserve pile of ore at the surface, enough to keep the mill going two months. The average grade of the ore milled in June was two ounces of gold per ton. The Johannesburg June output totals 365,088 ounces, 70 1/2 ounces over the May figures.

J. R. Daniel appeared before Judge Granger at Truro asking for the winding up of the Blue Hills Co. The shareholders in April decided to have the company wound up by the Court, and the company had ceased to carry on the business. There were 4163 shares, and the total debts amounted to £2208. The Judge granted the winding up order asked for.

NEW ZEALAND.

At the Progress mines, Reefton, results of crushing for June were: Ore crushed, 3200 tons, yielding (inclusive of sulphurets) £700 £2828, or £1 19s. 3 1/2d. per ton. Expenses, £2181, or 13s. 7 1/2d. per ton. Profit, £4167, or £1 5s. 8 1/2d. per ton. The manager states that the cost is below the average, owing to the milling of reserve ore, consequent on the temporary stoppage of tramway. During the four weeks the 40-stamp mill suspended work for four days.

NEW SOUTH WALES.

The gold yield of New South Wales the past seven months amounted to 181,321 ounces, being a monthly average of 25,974 ounces as compared with an average of 24,351 ounces for the corresponding period of last year.

QUEENSLAND.

The Queensland gold returns for July were 76,800 ounces.

A REVOLUTION IN FREIGHTING.

THESE WAGONS ARE ESPECIALLY ADAPTED FOR STEAM FREIGHTING; CAPACITY OF TRAIN 50 TONS.

"The Daniel Best" 50-Horse Power Traction Engine.

The most powerful and only Successful and Practicable Road Engine in the World. Over sixty of them in use in this State, and they are being Successfully and Profitably Employed in Hauling Logs Lumber, Ore, Salt, Borax and other kinds of freight.

The work is being done FIFTY PER CENT Cheaper than it is possible to do with Animal Power. They can be operated over any ordinary road where it is practicable to use mules or horses, doing the same work. They can ascend or descend grades as much as 20 to 30 inches to the rod, hauling their loads of 35 to 40 tons, depending upon the condition of the roads; loads may be increased to even greater amount on moderately level roads.

Send for descriptive Circulars and price List of Wagons and Engine. We solicit correspondence. No trouble to answer questions. Estimates made for complete Steam Freighting Outfits. Address

Evans Hydraulic Gravel Elevator,

— MANUFACTURED BY —

THE RISDON IRON & LOCOMOTIVE WORKS,
SAN FRANCISCO, CAL.

The cheapest and most efficient Gravel Elevator made. It will do more and better work than any other Gravel Elevator. It is fully protected by United States and Canadian letters patent. It infringes no patents, any statements to the contrary are false and made to mislead intending purchasers.

SANTA FE ROUTE

The Most Comfortable Way to Travel
ACROSS
THE
CONTINENT.

EVERY day in the year Pullman Palace Sleeping Cars and Pullman Tourist Sleeping Cars leave Oakland Mole for Chicago and the East.

HARVEY'S DINING ROOMS

And Lunch Counters Offer Good Food Well Cooked and Decently Served at REASONABLE PRICES.

THE altitude of the plateaus and mountains crossed renders the trip cool and pleasant after the desert is passed. No matter which way you go the desert must be crossed and there is less of it on the Santa Fe than on other lines. It is a popular mistake to suppose it is a hot line. Close connections are made in Chicago and Kansas City for all Eastern cities.

Ticket Office, 628 Market St., San Francisco, Cal.

CRIPPLE CREEK MINING DISTRICT

IS PRODUCING
Over \$1,000,000 per Month
IN GOLD.

Reached by
FLORENCE & CRIPPLE CREEK AND GOLDEN
CIRCLE RAILROADS,

In Connection with the Denver & Rio Grande.
For information, address
C. F. ELLIOTT, General Traffic Agent,
DENVER, COLO.

GOLD IN COLORADO!

Colorado has within its limits some of the greatest gold mines that has ever been discovered. In Cripple Creek in 1892 there were a few prospectors looking over the hills; in 1895 the camp turned out over \$5,000,000 in gold. Leadville, the old bonanza camp and the world's product of which made Denver what it is to-day, is becoming a big producer of gold. New inventions for working low-grade gold ores, together with the discoveries made to work rebellious ores, have opened up a field for the miners such as they have never enjoyed before, and Colorado has inducements to offer such as no other district in the world possesses; the record of the State in gold production for the last three years speaks for itself. Among the other prominent camps in the State are Telluride, Ophir, Rico, Silverton, Mineral Point, Durango, La Plata, Ouray, Saw Pit, Ironton, the Gunnison district and many others. New finds are being made and new camps are springing into existence every day. The Denver & Rio Grande Railroad, which is the pioneer road of Colorado and which has always been the miner's friend, reaches all the mining camps in Colorado. For elegantly illustrated descriptive books, free, of mines in Colorado send to

W. J. SHOTWELL, - - - General Agent,
314 California St., San Francisco, Cal.
S. K. HOOPER,
General Passenger Agent, - - DENVER, COLO.

La Sal Mountains.

NEW, RICH MINING DISTRICT.

Best reached by way of the
Rio Grande Western Railway
from CISCO or THOMPSONS stations.

Daily stage from Thompsons to Moab—here outfits can be secured at very reasonable rates—thence by wagon or saddle to LA SAL MOUNTAINS, twenty miles distant.

The formation is igneous and all the metamorphic rocks abound. Veins of quartz, quartzite, porphyry, granite and spar are well defined. The district promises a great future.
Send to F. A. WADLEIGH, Salt Lake City, for pamphlet.

Colorado's Mining Industry.

There have been a number of interesting and instructive pamphlets issued on this subject by the U. P. D. & G. Ry. and the South Park Line, Colorado's progressive railroads, which reach the principal mining centers of this vast mineral section. They are all carefully and conservatively prepared and will be mailed upon receipt of request and necessary postage. The various publications are as follows:

La Belle Gold Fields, 2c.
Gunnison Gold Belt, 2c.
Hints to Prospectors, 1c.
Ward Mining District, 1c.
Pine Creek, 1c.
Puma, 1c.
Breckenridge Gold Belt, 1c.

DEWEY, STRONG & CO'S PATENT AGENCY.

Our U. S. and Foreign Patent Agency presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American reports, with full copies of U. S. Patents since 1872. All worthy inventions patented through Dewey, Strong & Co.'s Patent Agency will have the benefit of a description in the *Mining and Scientific Press*. We transact every branch of patent business, and obtain patents in all countries which grant protection to inventors. The large majority of U. S. and foreign patents issued to inventors on the Pacific Coast have been obtained through our agency. We can give the best and most reliable advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and circulars free.

VULCAN ROPEWAY

— WITH —
**AUTOMATIC ORE LOADER AND
AUTOMATIC DUMPING DEVICE.**

For Conveying
Ore, Cordwood,
Etc.

EMPIRE, NEVADA, April 17, 1896.

Vulcan Iron Works.—GENTLEMEN: The Ropeway furnished by your company to convey tailings from Morgan Mill to Mexican Mill, a distance of seven-eighths of a mile, is giving entire satisfaction. We transport 200 tons of tailings in ten hours; one man does the whole business, including elevating tailings from hopper in the ground, operating Vulcan self-loader, and attending to the Ropeway generally. The self-dumper requires no attention whatever. The Vulcan loader I consider the best feature in the whole Ropeway, making it possible for one man to load 200 tons in ten hours.

Yours very truly,

J. P. WOODBURY, Supt.

VULCAN IRON WORKS,

AUTOMATIC
TRAMWAY
BUILT.

FINLAYSON PATENT
AUTOMATIC WIRE ROPE
TRAMWAY.

In this system the cost of trans-
portation is brought below any fig-
ure heretofore reached. Its tonnage
capacity is unsurpassed. Further
information on application.

MARSH STEAM PUMPS.

SINKING AND STATION PUMPS

For Mines.

BOILER FEEDERS,
Deep Well, Tank and Vacuum Pumps.

The MARSH SINKING PUMPS are Superior in the
Following Points:

- First—Compactness.
- Second—Strength of parts.
- Third—Fast speed, quiet action.
- Fourth—No throttle valve necessary in exhaust pipe.
- Fifth—Steam valve self-governing; will not race or pound if
water gives out with steam valve wide open.
- Sixth—All moving parts can be covered and protected from
falling dirt.
- Seventh—No packed joint between chamber and pump to
give out and need renewing.
- Eighth—Exhaust can be turned into suction.
- Ninth—All parts easily accessible and fewer than in any
other pump.

Simonds Saws. Genuine Dodge Wood Split Pulleys.
Leather Belting. Rubber Belting.
Grant Corundum and Detroit Emery Wheels.

Market Reports.

The Markets.

SAN FRANCISCO, Aug. 18, 1898.
SILVER.—London, 27½d; New York, 59½¢; San Francisco, 58½¢; Mexican Dollars, 46¢ 40/100.

COPPER.—Boston reports: Copper was advanced rather sharply this week in sympathy with a higher London market, and by reason of the withdrawal of one of the large Lake mines from the market. The demand during the week was larger than recently and the exports are of a fairly large volume, to say nothing of the reluctance of holders to part with their stock at present prices. Lake was advanced almost ½¢ and other grades in proportion. Lake closed at 11½¢@12¢, electrolytic 11½¢ and casting 11½¢@11½¢.

LEAD.—New York reports "higher and more active for consumption. Spot and nearby deliveries closed 4.05@4.12½," smelters quote 3.85; local, pipe, 6@6½¢; sheet, 6½¢@7¢; pig, 5½¢; bar, 6¢.

IRON.—American, soft, \$20 and \$22 per ton; Scotch, \$23.

SPELTER.—Dull at 5½¢ and 5½¢. According to the preliminary statement of the United States Bureau of Statistics, the production of spelter for the six months ending June 30th was, in tons of 2000 pounds:

| | |
|---------------------------|--------|
| Eastern States..... | 2,955 |
| Southern States..... | 1,695 |
| Illinois and Indiana..... | 21,258 |
| Kansas..... | 21,484 |
| Missouri..... | 10,371 |

Total.....57,743
Last half of 1897.....53,077
First half of 1897.....46,903

TIN.—Menlo Roofing, redipped, \$7; English, to arrive, \$4.50; Pig, 18¢.

ANTIMONY.—9½¢, 10¢.

BABBITT METAL.—10-12-14—best 16¢.

NAILES.—List per keg: No. 20 to 60d, wire, \$2.25; cut, \$2; 10 to 20d, wire, \$2.30; cut, \$2.05; 8d, wire, \$2.35; cut, \$2.10; 6 and 7d, wire, \$2.45; cut, \$2.20; 4 and 5d, wire, \$2.55; cut, \$2.30; 3d, wire, \$2.70; cut, \$2.45; 2d, wire, \$2.85; cut, \$2.70. In carload lots, 10¢ per keg less.

QUICKSILVER.—Domestic, unchanged, \$42.50@43¢; export and carload lots, special rates.

POWDER.—F. O. B., San Francisco: No. 1, 70% nitro-glycerine, per lb., in carload lots, 15½¢; less than one ton, 17½¢. No. 1* 60%, carload lots, 13½¢; less than one ton, 15½¢. No. 1** 50%, carload lots, 11½¢; less than one ton, 13½¢. No. 2, 40%, carload lots, 10¢; less than one ton, 12¢. No. 2* 35%, carload lots, 9½¢; less than one ton, 11½¢. No. 2** 30%, carload lots, 9¢; less than one ton, 11¢. Black blasting powder in carload lots, minimum car 728 kegs, \$1.50 per keg; less car lots, \$2 per keg.

FUSE.—Triple tape, \$5.10 per 1000 feet; double tape, \$4.35; single tape, \$3.45; Hemp, \$3; Cement No. 2, \$4.30; Cement No. 1, \$3.45.

CAPS.—3x, \$5.50 per 1000; 4x, \$6.50; 5x, \$8; Lion, \$9.

Commercial Paragraphs.

The Colorado Iron Works Co. have shipped ten cars of machinery for the San Juan G. M. Co.'s new mill, now being erected near Telluride, Colo. It will require three more carloads before the entire order is shipped. This plant will have the high-speed narrow face rolls to do the fine crushing and the management say that the plant will be a model one throughout.

The Krogh Manufacturing Co. have moved their machinery and stock from 51 and 53 Beale street, recently damaged by fire, to the large brick building Nos. 134 and 136 Main street. With better equipment and facilities than in the past, they will continue the manufacture of high-grade irrigation and mining machinery, for which they have a wide reputation.

The Jeanesville Iron Works Co. have under construction on recent orders four 10, 6x12 stroke, mine pumps; two 20, 12x18 stroke; one 30, 10x36; one 24, 42, 16x48; two 10, 12x18 condensers; one 26, 50, 16x48; one 20, 38, 12x36; one 8, 10, 12 condenser; one 24, 12, 12, all for local coal mines in Pennsylvania. A Middlebrook, the Denver manager, also reports construction of one 10, 16, 5½, 18 for Burke, Idaho, second order from same company, and building a carload of Cameron pattern sinks for the Denver store.

The Pelton Water Wheel Co. report a very active business, which seems likely to continue through the year. The dry season has materially affected the local demand, but their foreign trade is on the increase. Among their recent shipments are five wheels to various mines in Alaska, seven wheels for mining purposes to British Columbia, four wheels for an extensive electric power station in Japan, two wheels for operating a factory in Japan, seven wheels for various works in India and eleven wheels for mines in Mexico and South America.

Placer Miners' Attention

Is called to the fact that we are purchasers of

OSM-IRIDIUM

In lots of one ounce and upwards.

SELBY SMELTING & LEAD CO., 416 Montgomery Street, San Francisco.

COPPER MINE.—One-half interest in a rich copper mine carrying gold and silver and now producing considerable ore, is offered for sufficient capital to pay for necessary developments. For further information call or address MINER, 1032 Mission street, San Francisco, Cal.

WANTED.

Partner in Extensive Placer and Quartz Mines. Free wood and water. JAMES ARTHUR, Cornucopia, Union Co., Oregon.

Wanted by Sept. 1st an Experienced Assayer and Retort Man.

Daily assays and mine books to keep for ten stamp mill, one day from San Francisco Pay \$75 per month. Address, with references and experience, R. A. B., care this office.

A First-Class Map and Mining Draughtsman, with knowledge of Bookkeeping and Shorthand, *

WANTS POSITION with mining company or engineer in general office work. Will go anywhere. Address A. C. B., this office.

Experienced Chemist, Assayer and Cyanide Operator

DESIRES ENGAGEMENT. Has had charge of cyanide plant where segregated slime and slimy material have been worked to high percentage of gold value at small cost. References. Address P. K., this office.

POSITION WANTED

* By Superintendent of Mine and Mill, Having twenty years' experience in assaying, mining and milling gold and silver ores, and bullion refining.

Also familiar with the separation of gold from copper without acids, as practiced in Colorado. Have served four years as assayer in U.S. coinage mint. Address "Mine Supt." Mining and Scientific Press Office, San Francisco, Cal.

WANTED.

METALLURGIST and PRACTICAL SMELTER

Will be open for engagement October 1st as Superintendent of Copper or Lead Smelting Works.

Thoroughly competent in analyzing assaying, and handling men. Speaks Spanish. Excellent references. Address SMELTER, care Mining and Scientific Press.

Working Capital for Mines.

PACIFIC EXPLORATION COMPANY

Will form companies and find capital to develop mines on shares or commission. Miners who have a good prospect should write the manager of this company for particulars. Address W. E. HOLBROOK, Manager, 29-30 Chronicle Building, S. F.

A GOLD MINE

Seven Miles from R. R. 10 to 15-Foot Vein of Soft Ore, \$7 to \$8 Per Ton.

A half interest will be given to a responsible person for some development and a mill that will successfully treat the ore.

B. F. WILSON, Battle Mountain, Nevada.

Bargain, for Sale.

New Complete Mine

Machinery Outfit, Including No. 3 Merrill Mill, Rock Breaker, Ore Feeder, Etc.

E. A. HOLMAN, 906 Broadway, Oakland, Cal.

FOR SALE.

1 Rock Breaker,
1 5-Foot Huntington Mill,
3 Duncan Concentrators,
35 H. P. Roller and Engine,
Shafting, Pulleys and Belting.
Machinery but little used. Will sell for one-half San Francisco costs on board cars at Bailey. Address L. C. BAILEY, Hailey, Idaho.

MINE FOR SALE OR BOND.

TUOLUMNE COUNTY, EASTERN BELT.

HIGH GRADE.

PARTIALLY DEVELOPED.

Apply MINE OWNER,

Care Mining and Scientific Press, 330 Market St., San Francisco, Cal.

ANNUAL MEETING.—The Regular Annual Meeting of the stockholders of the Marguerite Gold Mining and Milling Company will be held at the office of the company, No. 237 Twelfth street, San Francisco, California, on MONDAY, the 22d day of August, 1898, at the hour of 8 o'clock P. M., for the purpose of electing a Board of Directors to serve for the ensuing year, and the transaction of such other business as may come before the meeting. Transfer books will close on Saturday, August 20th, at 2 p. m. F. MATTMANN, Secretary.

Office—Room 32, Nevada block, No. 309 Montgomery street, San Francisco, California.

POSTPONEMENT.

The date of delinquency of the foregoing assessment (No. 84) has been postponed to TUESDAY, the 6th day of September, 1898, and the day of sale from the 26th day of August, 1898, to MONDAY, the 26th day of September, 1898. By order of the Board of Directors.

ALFRED K. DURBROW, Secretary.

Office—Room 32, Nevada block, No. 309 Montgomery street, San Francisco, California.

DELINQUENT SALE NOTICE.

RED CAP MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Red Cap Creek, Humboldt County, California.

Notice.—There are delinquent upon the following described stock, on account of assessment (No. 4) levied on the 29th day of June, 1898, the several amounts set opposite the names of the respective shareholders, as follows:

| Name. | No. Cert. | No. Shares. | Am't. |
|---------------------------|-----------|-------------|---------|
| Harvey M. Buckley..... | 2 | 1 | \$ 2 00 |
| Alice E. Buckley..... | 20 | 4 | 3 00 |
| Alice E. Buckley..... | 23 | 20 | 40 00 |
| Alice E. Buckley..... | 24 | 20 | 40 00 |
| Alice E. Buckley..... | 25 | 20 | 40 00 |
| Alice E. Buckley..... | 26 | 20 | 40 00 |
| Alice E. Buckley..... | 32 | 1 | 2 00 |
| Alice E. Buckley..... | 40 | 2 | 4 00 |
| Caroline S. Townsend..... | 18 | 2 | 4 00 |

And in accordance with law, and an order from the Board of Directors, made on the 29th day of June, 1898, so many shares of each parcel of such stock as may be necessary, will be sold at public auction, at the office of the company, room 14, Nevada block, 309 Montgomery street, San Francisco, California, on MONDAY, the 29th day of August, 1898, at the hour of 3 o'clock P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

WILLIAM MOPHERSON, Secretary.

Office—Room 14, Nevada block, 309 Montgomery street, San Francisco, California.

DELINQUENT SALE NOTICE.

MARGUERITE GOLD MINING AND MILLING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Auburn, Placer County, California.

Notice.—There are delinquent upon the following described stock, on account of assessment (No. 10) levied on the 20th day of June, 1898, the several amounts set opposite the names of the respective shareholders, as follows:

| Name. | No. Cert. | No. Shares. | Am't. |
|-----------------------|-----------|-------------|----------|
| G. F. Volz..... | 7 | 500 | \$ 50 00 |
| Frantz Schmitz..... | 32 | 250 | 25 00 |
| Chas. Winters..... | 39 | 1,000 | 100 00 |
| M. Raschen..... | 65 | 250 | 25 00 |

| N. Rienecker..... | 351 | 200 | 20 00 |

And in accordance with law and an order from the Board of Directors, made on the 20th day of June, 1898, so many shares of each parcel of such stock as may be necessary will be sold at public auction, at the office of the company, No. 237 Twelfth street, San Francisco, California, on SATURDAY, the 12th day of September, 1898, at the hour of 4 o'clock P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

F. METTMANN, Secretary.

Office—No. 237 Twelfth street, San Francisco, California.

REGRINDING VALVES

The Wise Man Who Uses Valves

Calls for Lunkenheimer's Regrinding Valves, because he appreciates their superior and lasting qualities. If you want reliable Valves, specify and insist upon Lunkenheimer's. They have stood the test for over thirty-five years and are indorsed and liberally used by intelligent steam users everywhere. There is no such word as fail if you use Lunkenheimer's. None genuine unless name is cast in body. Supplied by dealers. Avoid worthless imitations. Catalogue of up-to-date steam specialties gratis.

ROPP STRAIGHT LINE FURNACE

FOR ROASTING, CHLORINATING AND DESULPHURIZING ORES.

Extracts from Letters Received from Mr. Philip Argall, Manager the Metallic Extraction Co., Cyanide, Colorado:

"The roasting is invariably good. We can do 80 tons per day to 0.13% sulphur, when everything runs smooth. Our month record which, of course, includes all delays, is 1700 tons, from 1.94% sulphur to 0.18%." January 2, 1897.

"Our furnace is now running very nicely indeed, averaging 90 tons per day to 0.10% sulphur, and doing excellent work; in fact, it has improved right along and we are highly pleased with it. For 24 hours ending 7 A. M. to-day 102 tons were roasted." February 19, 1897.

The ROPP FURNACE is now in successful operation at the following reduction works: The Hanauer Smelting Works, Salt Lake City, Utah (one furnace); The Metallic Extraction Co., Cyanide, Colo. (one furnace); The Colorado-Philadelphia Reduction Co., Colorado City, Colo. (three furnaces); The Selby Smelting & Lead Co., Selby, Cal. (two furnaces); The Mount Morgan Gold Mining Co., Rockhampton, Queensland (one furnace); Broken Hill Proprietary Co., Broken Hill, New South Wales (four furnaces); Puget Sound Reduction Co., Everett, Washington; Colorado Ore Sampling & Reduction Co., Cripple Creek, Colo.; Consolidated Kansas City Smelting & Refining Co., for the Arkansas Valley Smelting Works, Leadville, Colo.; Robert Lanyon's Son's Spelter Co., Iola, Kansas (two furnaces); Mountain Copper Co., Ltd., Keswick, Cal.

The Cochrane Separator.

The Cochrane separator is designed to take water out of live steam, to purify exhaust steam from cylinder oil, giving dry steam, preventing oil coating on the inside of pipes, etc., and permitting the use of the condensed exhaust steam for boiler feed or other needs. Fig. 1 illustrates the horizontal form, as adopted in U. S. gunboats; Fig. 2 is a sectional cut of the new high-pressure pattern for horizontal pipe; Fig. 3 is the standard horizontal form; Fig. 4 the high pressure form for horizontal pipes; Figs. 5 and 6 depict the vertical separator. The Harrison Safety Boiler Works, Philadelphia, have been making these separators since 1889; there are over 1700 in present use, and testimonials evince the satisfactory character of the service. They claim for live steam service that they will, in either the horizontal or vertical form, deliver exhaust steam so thoroughly purified from grease or cylinder oil that this steam can be safely used for heating, by actual contact, water for boiler feed, dye house, and other purposes—or that this steam, when condensed, will be entirely suitable for similar uses. They assert that the measure of efficiency will range from 98 per cent up to practically perfect separation, depending upon the favorableness of the conditions, and the quality of the oil used. The Parke & Lacy Co., 21 and 23 Fremont St., San Francisco, are the agents on this coast. They furnish detailed technical information as to the placing and operation of the apparatus.

It is difficult to understand why the Southern Pacific Railroad Company has always so persistently discounted all efforts to make prominent the mines and miners of California, unless it be that the corporation wants to absorb the mineral area of the commonwealth. While every railroad company in other States does all possible to attract attention to the mines within the borders of the States they traverse, the California road seems afraid that some one will find out that there are gold mines in California. Such a policy is fatal to true progress. Rightly viewed, the Southern Pacific Company should do as every other railway company everywhere else does—encourage the development of the State's mineral area and the growth of the mining industry. No trade or profession is better for the railroad than that of the liberal miner. The farmer only ships his surplus; everything that

the miner produces or consumes is carried by the railway. He is the railway's best customer.

An erroneous statement was made on page 179 of the issue of the 20th inst., wherein it was said that a "placer location of 160 acres by an association re-

FIG. 1.

FIG. 2.

FIG. 6.

THE COCHRANE SEPARATOR.

quires a discovery of mineral on each twenty acres." This is a mistake and misleading. In the case of the Union Oil Co. on review, 25 L. D., 357, 358, Secretary of the Interior Bliss overrides the previous decision thereon, and rules "that when a location is

Improved Swing Engine Lathe.

Herewith is illustrated the New Haven M'fg Co.'s latest improved 24" swing engine lathe. The head is stiff and strong, having solid web entirely across under cone pulley, with hammered crucible steel, hollow spindle $2\frac{1}{8}$ " hole running in hard bronze boxes; front bearing $3\frac{1}{4}$ " diameter, $5\frac{1}{2}$ " long; back bearing, $3\frac{1}{4}$ " diameter, 4" long; spindles back geared, hardened steel bushing with check nut, for taking up the end thrust; cone pulleys have five steps of 7", 9", 11", 13", 16" diameter for 3" belt. Carriage stiff, with long bearings on the V's; is gibbed front and back to the outside of the bed, with power cross feed and compound rest, having graduated base, and held by two bolts; with taper gibs scraped to fit, and adjusting screws; tool is adjusted by concave ring and washer. Attachments furnished with the lathes are compound rest, center and follow rests, extra tool block for turning the full swing of the lathe, large and small face plates, full set of screw cutting gears.

Complete friction counter-shaft, with pulleys, hangers, self-oiling boxes, wrenches, etc. Driving pulleys on counter-shaft are 12" and 15" diameter, 4" face and should run about ninety revolutions per minute. They are set up and thoroughly tested before leaving the works, and guaranteed accurate. Taper turning attachments, three tool shafting rests, shafting straighteners, and chucks of any desired make, can be furnished fitted to the lathes.

The New Haven M'fg Co. build lathes from 18" swing to 60" swing, and varying lengths of bed; all as well proportioned and strongly built as the 24" tool illustrated below. Henshaw, Bulkley & Co., corner Fremont and Mission streets, San Francisco, Cal., are local agents for the New Haven Manufacturing Company.

KLONDIKE is still a name to conjure with in New York City, where "mining and transportation companies" issue an ostensible "mining journal for miners and investors." Its leading article in the issue to hand gives the Klondike gold output for this year as aggregating over \$30,000,000. Conservative estimates in San Francisco place the amount received therefrom this year at \$6,000,000. On page 7 is this statement: "\$9,500,000 arrived — \$10,000,000 en route — \$15,000,000 more coming." The success of the Electrolytic Marine Salts Co.'s swindle in Boston shows that there are many on the Atlantic coast sufficiently credulous to invest on the strength of such barefaced lies as those published in this latest "mining journal." Eastern readers should know by this time that by going to that region they will probably lose their health or life, and by putting money into wildcat "investment companies" they will certainly lose their coin.

IMPROVED SWING ENGINE LATHE.

made by an association one discovery is sufficient." It is, of course, evident that to make a location covering more than twenty acres there must be an association consisting of at least one person for each twenty acres so located.

Treatment of Low-Grade Copper Ore.

An Arizona subscriber asks, "Do you consider it practical to leach a copper ore carrying 5 or 6 per cent copper, which is too silicious to smelt?" To one unacquainted with the exact circumstances it is difficult to more than give an approximately correct answer. In general, it may be said that a 6 per cent copper ore can be leached successfully—that is, from a chemical or laboratory point of view, though the commercial results may not always be favorable. The proposition of our Arizona enquirer does not look encouraging from an economical standpoint. If there are large quantities of that ore and he has command of considerable money, he may make a commercial success of it. The process itself is not a difficult one. The copper must be transformed into a sulphate, if water is to be the leaching medium. In case sulphuric acid can be secured cheaply a simple oxidizing roasting will bring the copper to a condition where it will dissolve in diluted sulphuric acid. In case the copper in the ore is a carbonate, the roasting, of course, can be omitted in the acid leaching. It is a common metallurgical practice in this case to pile the ore, allowing the rain and air to oxidize the copper sulphides, forming copper sulphate, which water will extract from the ores; but this is a slow process, involving a very long wait for the returns. There is an electrolytic treatment to leach auriferous copper ore that, if it gets beyond the laboratory stage, may be of practical use in such cases. In the process mentioned the ore carrying a little gold and copper can be leached with a hot solution of cupric chloride in a rotating barrel, through which a slow alternating current of electricity is passed. This cupric chloride solution is prepared with a saturated solution of calcium or magnesium chloride or salt, so that the combined chemical and electrical action extracts all the copper from the ore. The clear solution is run through a barrel containing copper oxides or hydrates, which remove all the iron and similar impurities from the solution, leaving in it only pure copper. This solution is then passed into rectangular vats containing porous asbestos partitions with electrodes for conveying the current to the solution as it passes in the vats. As the copper is deposited, the solution is pumped back to a reservoir for further use, this being made to last indefinitely, a little water being added to make up for evaporation and a little chemical to supply losses by leakage. The ore being freed from copper is then in condition for cyaniding. It should be added that, so far as known, the above has not been tried on a scale that would entitle it to endorsement from a commercial standpoint. As our Arizona enquirer doubtless knows, a process that may be satisfactory and successful on a very small scale oftentimes fails to produce dividends or even the requisite amounts for salaries, etc.

Carbonate copper ore is susceptible to leaching with sulphuric acid and deposition by electrolysis. A generator of 100 amperes, through a series of 320 vats or plates, will, theoretically, deposit 2000 pounds of copper per twenty-four hours from a sulphate solution and nearly 4000 from chloride solution. The per cent of bluestone is proportionate to the increase or decrease of surface; with 8 per cent it would be about 10 feet. Where sulphate is used and insoluble anodes, lead or carbon would do for the anodes. The vats in such case should be small so that the slimes deposited from aeration of the solution could be easily cleaned out without disturbing too much of the series. A convenient size would be 4 feet square on each end and from 5 to 8 feet in length if a simple series is used, or 15 feet if tandem series; anodes 36x40, or with common series can be composed of smaller pieces. With such plate service the generator should have about 125 voltage.

Before attempting anything in the line suggested, there should be detailed and exhaustive examination and expert advice secured and economy exercised. In this case, as in others, economy means the judicious expenditure of money, and it would be good economy to first spend \$2000 or \$3000 in the way suggested in determining whether it would be worth while to go any further in the matter.

Of Interest to Prospectors and Miners.

A recent decision by Judge Cheney of the Nevada second judicial district is considered of sufficient importance to justify publication in full. One Sisson made a location May 25, 1897, erected a location monument and placed a notice on it. In July the boundaries were marked and five days' work was done on the claim. More than ninety days thereafter, defendants made a location covering the same ground. Sisson then sued the Sommers party for trespass, damages and an injunction; defendant attacked the location of the plaintiff on several grounds, but the court decided the case in favor of defendant solely upon the ground that plaintiff had not within ninety days after posting his notice of location done the amount of work required by the Statute of 1897, page 103, nor did the plaintiff do that amount of work at any time prior to the entry of the defendant. Following is the text of the decision:

In Second Judicial District Court, Washoe county, Nevada. D. H. Sisson, L. S. Bridges, A. F. Sisson and J. L. Barron, plaintiffs, vs. Robert Sommers and R. N. Norris, defendants.

This is an action of trespass to mining property and for damages and an injunction. The plaintiff, Sisson, on May 25, 1897, went upon a vacant piece of ground in the White Horse mining district in Washoe county, which he had previously prospected, and commenced the location of a mining claim, known as the Morning Star, by erecting a location monument with a notice written thereon. Nothing further was done by him until late in July, when, with the assistance of Barron, one of the plaintiffs (who was to have an interest in the claim as pay for his labor performed thereon), he marked the boundaries of the claim and set Barron to work on the discovery work, within the limits of the claim. Barron worked five days and exposed rock in place bearing gold. The excavation was made by him—by some of the witnesses called a shaft and by others a cut—was, more accurately speaking, a combination of both, being a shaft with a cut from it to the surface. Nothing further was done by the plaintiffs on the Morning Star location in the way of development work until after this action was commenced.

The validity of plaintiff's location is attacked on many grounds. The only objection which it is thought necessary to consider at length is that sufficient discovery work had not been done to perfect the location of the Morning Star. In my opinion there was a sufficient discovery of a lode, marking of the boundaries, posting of a notice and recording of a location certificate, prior to the entry of the defendants upon this ground, to entitle the plaintiffs to the possession of it. From a careful consideration of all the evidence as to the amount of development work done by the plaintiffs before defendants started their location, I find that there was a shaft with a depth not exceeding seven feet below the lowest point of the rim at the surface, and that this shaft, which was about three and a half feet by four and a half feet at the bottom, was connected with the surface by a cut on a level a little above the bottom of the shaft. From the point where the cut began on the surface to the opposite side of the shaft was ten feet. This excavation did not cut or expose the lode at any place at a greater depth than eight feet. It did not run along the lode; but the lode, as discovered, appears to run diagonally across it, and the lode was not exposed for more than five feet on its course when this action was commenced.

No rules or laws have been adopted by the miners of this district. The Act of Congress is silent as to the discovery work except that it provides a minimum amount of expenditures in labor or improvements which must be annually made upon each location. There was no State legislation fixing the amount of work necessary to be done upon a mining claim in this State until March 16, 1897, when by the second section of an Act of that date, entitled among other things "An Act relating to the * * * amount of work necessary to hold possession of mining claims" * * * It is provided: "Before the expiration of ninety days from the posting of such notice upon the claim, the locator must sink a discovery shaft upon the claim located to the depth of at least ten feet from the lowest part of the rim of such shaft at the surface, or deeper if necessary, to show by such work a lode deposit of mineral in place. A cut, or crosscut, or tunnel, which cuts the lode at a depth of ten feet, or an open cut of at least ten feet in length along the lode from the point where the lode may be in any manner discovered, is equivalent to a discovery shaft." (Stat. Nev. 1897, page 103.)

It is plain that the plaintiffs did not within ninety days after posting the location notice, or at any time before defendants entered upon this ground, do the amount of discovery work which this statute requires. The United States, as the permanent proprietor of the public domain, has the undoubted right to exact a compliance with every term and condition which it may see fit to impose as a prerequisite to the possession of its mineral lands. To the extent which it expresses its will, miners' laws and State legislation must yield. But it has very plainly indicated an intent and willingness that the miners, to the extent of their district, and the State throughout its limits, may impose reasonable additional conditions and limitations so long as they are not in conflict with the federal legislation. (Lind. on Mines, Secs. 248 and 249.)

Among the subjects which seem unquestionably proper for State legislation, within reasonable limits, is the requirement that a certain amount of discovery work shall be done within a certain time to complete a location. "The State courts have uniformly enforced this class of provisions; and there being no authoritative ruling denying the right of the State to so legislate, these conditions may be assumed to be valid." (1, Lind. on Mines, Sec. 250.)

"The laws of the United States do not prescribe any time in which the excavations necessary to enable the locator to prepare and record a certificate shall be made. That is left to the legislation of the State, which, as we have stated, prescribes sixty days for the excavations upon the vein from the date of discovery and thirty days afterwards for the preparation of the certificate and filing it for record. In the judgment of the Legislature of that State this was reasonable time." (Ehhardt v. Boaro, 113, U. S. 536.)

"The discovery shaft is a part of the process of location subsequent to discovery." (1, Lind. on Mines, page 345. Morr. "Mining Rights," 8th edition, page 27.)

Congress has fixed the minimum of labor or improvements which the locator must annually put upon his claim in order to be entitled to the exclusive possession of it. The history of the discovery of the precious mineral upon the public domain and the acquiescence and legislation of the national government brings forth with great distinctness its dominant purpose and intent, viz., the utmost encouragement to those who in good faith seek for and discover the precious minerals. But this faith must be evidenced by acts. Wisely recognizing that each State has an interest in and a right to legislate respecting the territory within its limits, and that no arbitrary standard except as to the minimum could be safely made for the different conditions of locality and time throughout our extensive mineral regions, Congress has clearly recognized the rights of the States to require labor or improvements in addition to that made necessary by the laws of the United States. Locators should never forget that they are permitted, by the bounty of the owner, to enter on his possessions and dig in the soil thereof upon such terms and condi-

tions only as the owner may choose to impose. The Government does not want an idle possessor of its mineral land, but a vigilant development of its natural resources. Every one familiar with mining localities knows that this bounty and privilege has been grossly abused by every device which ingenuity could invent to retain exclusive possession with the least possible expenditure of muscle or money. The disposition by relocation, evasion and false affidavits to hold mining claims, not for present development, but future speculation, has been so notorious and injurious to our mining interest that the Legislature of this State may well have been moved to interfere to remedy this evil by the exercise of its right to require a certain amount of labor within a fixed period.

The provisions of the Act of 1897, requiring a certain amount of discovery work within ninety days after the posting of the notice of location, are not in the nature of a forfeiture, but an essential element to the location itself—the element of all others in which the State is most concerned. It is a matter of comparative indifference to the State whether its mines are developed by the first locator or another; but it is immensely interested that they be developed. To accomplish this end, it has provided that, before the right to exclusive possession becomes established a definite amount of development work shall be performed.

These provisions are plain, their fulfillment not onerous, their requirements reasonable and he who avails himself of the privilege should observe the conditions exacted. Congress in the exercise of an undoubted right has fixed one year as the period within which a certain amount of expenditures must be made to continue the right of possession. Courts have never felt authorized, with all the liberality which they have shown in other respects, to extend this period when others have acquired rights before work has been resumed. The doing of the annually required work has been deemed imperative. (2, Lind. on Mines, Sec. 624.)

No question of forfeiture arises here. The inquiry is, Has any right ever been perfected? It should not be forgotten, as stated above, that "the discovery shaft is a part of the process of location subsequent to discovery." The power of the State, by the consent which Congress has given it to fix a reasonable period within a reasonable amount of work, must be done to complete a location and seems as certain as the power of Congress to declare the amount that is necessary to continue it. While courts have conceded much to the possible unlettered miner and the obstacles often surrounding the making of his location, there is no reason for extending that doctrine to a failure to use the muscles with which he is usually pretentiously endowed. If the location is made in good faith, the prudent miner will not jeopardize his right by any questionable performance of the required amount of discovery work. His interest, as well as the purpose of the Government, are furthered by the doing of an excess rather than less than the required amount. The right to possess a certain portion of the mineral domain rests not upon a disclosed intent to work it, but the actual doing of at least the amount of development work which the law has declared shall be done.

If the excavation for development purposes may be any less in dimensions than the statute directs, how much less may it be? When the courts depart from the standard of good faith which the dominant proprietor has established, namely, the standard of a certain amount of work within a certain time, they enter upon a realm of conjecture and speculation—an encouragement to the indolent and a discouragement to the vigilant. I am unable to see how the courts have any more right to say that less than the statutory amount of discovery work, within the time fixed by law, will be sufficient, when others have located the ground before work has been resumed by the original locator, than they have to do so with respect to the annual assessment work which Congress exacts. The interests of the bona fide locator, policy of the law, the welfare of the commonwealth and the intention of the Legislature are best fostered by requiring a faithful compliance with these plain conditions, upon the fulfillment of which a right to the exclusive possession of the public domain is granted. The conclusion reached is that, since the Act of 1897, it is necessary in this State to constitute a valid location of a mining claim that the locator shall, within ninety days after posting his notice, do the amount of development work required by that Act. If he does not do so, the ground covered by his notice is subject to location by another, no matter how plain his notice, certain his boundaries, perfect his record or well defined his lode may be. Had the plaintiffs completed the required amount of discovery work at any time before defendants entered and commenced their location, although the ninety days had already elapsed, they could have maintained their rights.

"The failure to perform any of the given acts within the time limited by the laws or local rules may subject the ground to relocation; but if the requirements are complied with prior to the acquisition of any intervening rights, no one has a right to complain. Of course, the locator delays at his peril; but if the appropriation becomes complete before any one else initiates a right, the antecedent delay is condoned and their right becomes perfected. But, unless completed, the attempted location is of no avail as against intervening rights, assuming, of course, that the subsequent entry for the purpose of location is peaceable and in good faith." (1, Lind. on Mines, Sec. 330.)

But plaintiffs did not attempt to do so until after this action was commenced. Let judgment be entered for the defendants.

A. E. CHENEY, District Judge.

Some Questions Answered.

A mining engineer writes from Oakland, Cal.:

Lately, while visiting a remote mining district, a number of questions were put to me, relative to matters of present interest to the miners I met. I answered them, I believe, in the main, correctly, but, by request, I undertook to present them to your paper for answers. As your paper is read by these men, I hope you will give place therein to more authoritative answers. Although the matters are generally well understood, not all your readers are clear about them:

1. Are locations of water rights, lode and placer claims, made on Sunday or other holidays, legal?
2. What are the legal holidays in the State of California, and what business acts done on them are legal?
3. What are the maximum amounts of placer ground which a single person, or persons, may embrace in a single location, and how many locations may be made in the same locality?
4. If a number of placer locations are embraced in a single tract, how much yearly assessment work must be done on each location or claim, and how much to secure a patent?
5. Can work done on a ditch or canal, for service upon all the claims, be applied to assessment work for all, and also for the expenditure necessary to obtain patent?

The above, in their order, may be answered as follows:

- 1.—Yes, generally speaking.
- 2.—The legal holidays in California, within the meaning of the Civil Code, are every Sunday, the 1st of January, the 22d of February, the 30th of May, the 4th of July, the 9th of September, the 1st of October, the 25th of December, every day on which an election is held throughout the State and every day appointed by the President of the United States, or by the Governor of California for a public feast, thanksgiving or holiday. If the 1st of January, 22d of February, 30th of May,

4th of July, 9th of September or 25th of December falls upon a Sunday, the Monday following is a holiday.

3.—An individual locator, whether a natural person or a corporation, may not include more than twenty acres in any one placer location. An association of eight persons may include 160 acres of placer ground in one location or claim. This is not what is termed a "consolidated claim" within the meaning of the Land Office regulations. It is not necessary to mark out the boundaries of each twenty acres in the 160-acre location, but the location must be so marked that its exterior boundaries can be readily traced. Such a claim is limited, however, to twenty acres when it appears that the location was really made for the benefit of an individual or company.

4.—The annual assessment work required upon a placer claim is \$100, whether the location embraces 160 acres or less. Five hundred dollars' worth of work upon each location is a necessary prerequisite to patenting the claim.

5.—Work done upon a ditch or canal may be applied to the representing of a number of contiguous claims held in common if done for the benefit of such claims, that is, if it tends to the prospecting or development thereof, and is sufficient to amount to equal the necessary expenditures upon all the claims. Assessment work of the value of \$500 is usually accepted as sufficient in patent proceedings.

Concentrates.

ENERGY may be defined as the power of doing work.

BUTTE, MONT., has a monthly payroll of nearly \$1,000,000.

THE notorious Hartsfeldt is now operating in Zacatecas, Mexico.

Six little sawmills in Dawson City are each clearing \$1000 per day.

JULY's production of anthracite coal in the United States was 3,770,000 tons.

UTAH has organized a bureau of commerce and mining, with headquarters at Salt Lake City.

THE greater part of the cyanide gold produced in South Africa is between 700 and 800 fine.

AT the Camp Bird mines in Ouray county, Colo., a tramway is being built 10,450 feet in length.

THE Tiger-Poorman mine at Burke, Idaho, reports net profits for the year to June 30th of \$64,604.46.

UTAH is fast developing into a gold-producing State. Colorado maintains the lead she made in '97.

IN addition to the mints at Melbourne and Sydney, a third is to be established in Western Australia.

ASBESTOS of good fiber and in commercial quantity finds sale in San Francisco at from \$20 to \$30 per ton.

THE 6-stamp mill of the Wm. Tell mine, near Sierra City, Cal., was destroyed by forest fire last week.

THE Everett, Wash., smelter has an order for lead from the Japanese government aggregating 1,000,000 pounds.

J. H. BENT wants Prescott, Arizona, to give a \$25,000 guarantee or bonus for a "custom smelting plant" there.

CERUSITE is an adamantine white to grayish-black lead carbonate $PbCO_3$, crystallizing in the orthorhombic system.

AT De Lamar, Idaho, the city band is composed exclusively of miners, all of whom, with two exceptions, are Cornishmen.

THE United Verde Copper Co. in Yavapai county, Arizona, pays taxes on an assessed value of \$222,000 worth of property.

THE Anaconda, Montana, Co. has ordered a steel hoist for the High Ore mine, capable of lifting ore from a depth of 4000 feet.

THE Tribune says that Salt Lake City, Utah, paid \$6000 for the July convention there of the International Mining Congress.

NEARLY every gold-producing California county reports river mining in present progress, the streams being unusually low this season.

MONTANA MEN are about to dredge for gold in the bars of the Missouri river near Stubbs Ferry, where two dredgers are now building.

THE Colorado Fuel & Iron Co. in 1897 produced 6027 tons of pig iron. The same company's product the first half of this year is 34,581 tons.

THE Los Angeles, Cal., Mining and Stock Exchange, which has been operated there, has decided to wind up its affairs and go out of business.

THE Nevada State press are taking sides on the question of bonding the State to raise funds for the resumption of deep mining on the Comstock.

THE ordinary mercury loss in a 10-stamp gold mill should not be over fifteen pounds per month. A pound of quicksilver occupies 2.035 cu. in. space.

IN the St. Paul iron mine at Moravitz, in Hungary, the daily amount of water handled is 35,000 gallons. The pumping plant is run by electricity.

A YEAR with a 9 in it is counted lucky for and by miners: '49, California; '59, Pike's Peak; '69, White Pine; '79, Leadville; '89, the Transvaal; '99, —?

A CIRCLE 12 feet diameter has an area of 113.1 feet and a circumference of 37.7 feet. A circle $\frac{3}{4}$ inch diameter has circumference 1.1781 inch and area .110477 inch.

A. ROSETTE, while ascending the shaft in the Original mine at Butte, Mont., last week, fell 800 feet by the parting of the cable. He was only dazed, receiving no injury.

AT Clausthal, in the Harz, the experiment of using beech and fir instead of pine for timbering in stopes has proven successful where the rock pressure was not too great.

PROTOGENE is a variety of granite in which talc takes the place of mica, so called by French mineralogists, who supposed that it was the first formed of the granites.

THE Tuolumne County, Cal., Independent says there are 1000 more voters on the great register of that county than there were in '96, due to the advancement of the mining industry.

THE total production of crude oil in the U. S. in the year 1897 was 54,394,172 bbls., a daily average of 149,086 bbls. During July, 1898, the daily production of crude oil averaged 125,329 bbls.

THE concentrator at the Morning mill, Mullan, Idaho, has a capacity of 800 tons more than any other silver-lead concentrator now in operation in the world, according to the local paper.

UNITED STATES copper production for last month aggregated

16,052 long tons; for July, '97, 15,344 tons. European copper production last month aggregated 6794 tons; for July, '97, 7327 tons.

ACCORDING to the Mining Reporter, in making a survey to secure patent for title of the Taylor Park placer ground containing 102 acres in Gunnison county, Colo., 700 corners were discovered.

THE Victor mine, in Cripple Creek district, Colo., has declared dividends since March 10th, '93, including that for September, amounting to \$1,055,000, being \$55,000 in excess of the capital stock.

IN the drilling contest at Leadville, Colo., Aug. 14th, N. McKenzie and S. Steward made 42 5-16 inches. This is the best record for Leadville rock, that of last year being 40 13-16 inches.

THE Harney Peak experience does not deter continued investigation of tin deposits in South Dakota. C. Poulot, a French chemist, is examining what is said to be "a tin vein" near Deadwood.

A BROKER is one who handles other people's money, employing none of his own in the business. A banker is one who loans his own money or surplus, whether he maintains a banking institution or not.

THE electric plant at Canyon City, Colo., that furnishes power for Cripple Creek mines, twenty-four miles distant, is said to have cost \$250,000; \$125,000 additional will be spent to complete it at the Cripple Creek end.

THERE will be a meeting in San Francisco, September 6th, of the executive committee and special committees of the California State Miners' Association, at which time the date of the 1898 convention will be announced.

E. S. McCOMAS who is interested in mining on Snake river near Boise, Idaho, has begun the construction of seven dredges. He says the bars there can be operated with dredges at a profit if the yield is only 10 cents a yard.

TO OCT. 1, '96, the Con. Cal. & Va. mine on the Comstock lode, Nevada, produced \$131,637,307.82: of this bullion, \$61,780,474.86 was gold and the remainder silver. The total dividends to the date mentioned were \$78,148,000.

THE duty of the stamps of the Alaska-Mexican Mining Co. is 3.7 tons per twenty-four hours running time: their weight is 1020 lbs., dropping ninety-seven times per minute: the average cost of milling is 45 cents per ton, including sulphuret chlorination.

OWING to the establishment of a larger similar plant in New York, the Alameda, Cal., Pacific Coast Borax Works has shut down after an almost continuous run of twenty-one years. The Alameda establishment refined three carloads of crude borax daily.

IN the Morison quick-running stamp mill the stamps weigh, each, 1000 pounds, the drop is 7 inches, and the speed 135 per minute. The stamp and action was described by the inventor in the issue of Aug. 21st, '97. The stamps are lifted by levers instead of cams.

FROM Grass Valley, Cal., where mining is extensively carried on, were shipped last week 5047 boxes of Bartlett pears, verifying the assertion that in California fruit is plucked from the surface of ground from which the gold product continues to flow.

ALMANDINE is an iron-alumina garnet, Si_3O_{12} . When of a fine deep red, from India, and transparent, it is "precious garnet." The iron-aluminum garnets, which are reddish to black, are cut into gems and then called noble, oriental or rose garnets, or almandine.

AT Cripple Creek, Colo., it has become possible to reach the camp in a Pullman car, ride to the mines in an electric car, descend in an elevator run by electricity, see by electric light the underground workings and observe the ore hauled to the surface by electric power.

EXPENSE and litigation may be avoided by remembrance of the fact that even possession of a mining claim, though accompanied by development work, without compliance with location laws, will not hold against subsequent locators of the same ground who do so comply.

THE silver output of the Broken Hill Proprietary, Australia, during the six months ending June 30th, '98, was 2,873,684 ozs. fine. Good results have been obtained from the sale of lead and copper matte, and, after allowing £37,703 for depreciation, the net profit for the half-year was £139,856.

SINCE the cessation of silver mining in Caribou, Colo., the town had dwindled to twenty people eighteen months ago. To-day there are over 600 people, and within a half mile circle, from which \$12,000,000 silver was produced, there are at present eight mines working, principally gold.

TO DETERMINE the necessary diameter of a required pipe, knowing the volume and velocity of the water, multiply the number of cubic feet of water by 144 and divide the product by the velocity in feet per minute. The quotient is the area: divide this by .7854, and the square root of the quotient is the diameter required.

SECTION 1183 of the California Code of Civil Procedure gives miners in California, performing labor upon or furnishing materials to be used, a lien upon the property on which they have bestowed such labor or furnished such materials, for the value of such labor done or materials furnished, whether at the instance of the owner, or any other person by his authority.

PROFESSOR F. KUPFELWIESER, in the Transactions of the Austrian Engineers and Architects' Society, publishes statistics of the world's coal supplies, extending over a number of years. He shows that Europe, which in 1870 supplied 84 per cent of the coal used, in 1897 supplied only 69 per cent. North America in 1870 furnished 15.1 per cent and in 1895 supplied 30 per cent.

IN connection with the illustrated article "To Measure Flowing Water," on page 113 of the issue of July 30, '98, it may be said in answer to inquiry that the H. P. of water can be approximately determined, where the head or fall in feet and the flow in miners' inches are known. The miners' inch = $\frac{1}{2}$ cu. ft. per minute: the H. P. of 1 inch under 100 feet fall = .24147; of 40 inches, same fall, would be 9.6583 H. P.

THE Montana Power Co.'s dam on Big Hole, Beaverhead county, Mont., which was built last year at a cost of over a quarter million dollars, and washed out last spring before proper headgates could be constructed, will be rebuilt and the electric plant be in operation within ninety days. The Butte Miner says that an additional expense of a quarter million dollars will not prevent its being a dividend paying enterprise.

THE principal varieties of mica are muscovite or white, phlogopite or amber, and biotite or black, the last being of

little commercial value. The value of the Los Angeles specimens submitted depends upon the owner's ability to get it out in large blocks, and the fineness of its grain. There is constant demand for mica mined in blocks of considerable size, and susceptible of being split into even sheets. Canada and India furnish mica in such quantities and at such prices as to discourage domestic production.

THE Red Mountain Tunnel Co. proposes to run a tunnel from the Columbia river near Trail, B. C., to tap Red mountain near Rossland, a distance of five miles. The purpose is to drain the mines of Rossland, ventilate and furnish them with light and power, and afford economical methods of extracting ore. The work is estimated to cost \$4,000,000. C. R. Hossmer, who is interested in the Center Star, Virginia, and Monte Cristo mines, and H. S. Holt, the railway magnate of Montreal, are leading the project.

UNUSUAL is the scene at Summerland, Santa Barbara Co., Cal., where on the ocean beach on a platform built out 300 feet in the water are pumps raising rich, black petroleum from the sea. Rich strata of oil lie beneath the ocean's bed, and wells that puncture the rocky, sandy bottom give it an outlet. The Treadwell platform, or wharf, 300 feet in length, has a string of wells along its sides, and the limit of the submarine oil field has not yet been reached. Even in California it is something new to bore in water for oil-bearing sand, striking it successfully at a depth of 325 feet.

AT the University of California, Berkeley, Cal., during the ensuing scholastic year Curtis H. Lindley of San Francisco will deliver a series of lectures on "The Public Lands, Mines and Water," which will comprise a discussion of the public land system, the methods by which the Government acquires and disposes of its lands, and the genesis, development and theory of the law of mines and the law of water, as applied in western America. Such a series of lectures will constitute an important feature of that part of the University course, and, coming from so competent an authority, will be of value.

SUMPTUARY laws that would be resented by American miners are rigidly enforced in some British colonies. Following is a copy of a notice sent for cause on July 1 to the manager of the Boulder Main Reef, Kalgoolie, by the warden of the East Coolgardie goldfields: Sir,—You are hereby warned that unless you comply with Regulation 98 and Schedule 22 by notifying to the Statist of the Mines Department the result of every crushing and other treatment of ore, within fourteen days, legal proceeding will be taken against you, the penalty being a fine and possible forfeiture of your lease.—F. HARE, Warden.

THE arrastra is still used in California and other States, and is a favorite in many almost inaccessible localities. It is a good amalgamator, but an expensive crusher. It is a primitive contrivance—usually a shallow, tub-shaped enclosure about 12 feet in diameter, of either iron or stone. An upright shaft fixed to pivots above and below stands in the center, and from it arms extend, to which horses or mules are hitched. Usually, however, arrastras are of one mule power. Blocks of stone, attached by thongs or chains to the central arm, are dragged around the enclosure, the front of the lower surface of each block being slightly raised, so that the block crushes the finely crushed ore in its passage. When the ore is well pulped mercury is added and the grinding process continued during amalgamation.

THE Republican State Convention which met at Sacramento, Cal., with cheers adopted the following in its platform: "The mining industry, ranking as it does among the foremost industries of our State, is entitled to the fostering care of both our State and National governments, and we congratulate the miners of California that legislation inaugurated by a Republican Governor, and carried to completion by a Republican Legislature and a Republican Congress, placed their industry where it rightfully belongs, and surrounded it with such legislative safeguards as have restored confidence among those engaged in the mining industry, and caused a large and rapid increase in the yield of the mineral products of California. We pledge our legislative and congressional nominees to continue the work so happily begun under Republican auspices until all needful legislation in behalf of the mining industry shall have been accomplished. We favor the creation of a national executive Department of Mines and Mining, with a Secretary at its head who shall be a member of the President's cabinet, and we hereby pledge our congressional nominees to the use of all honorable means in their power for the creation of such a department. We look forward with pardonable pride to the early construction already assured of the restraining barriers, for which a half million dollars have been appropriated by our State and National governments. The mineral lands of California should be preserved for occupation and development by the miner, and we pledge our nominees for Congress to labor for such National legislation as will fully accomplish this."

THE greenish, or greenish gray, film forming on copper plates, often showing various colors, is due to the oxidation of copper in the amalgam; or it may be due partly to the effect of sulphates in the ore, in which case it would be at least partly a basic sulphate of copper. On good electro-silver plated copper plates it is probably never seen. It certainly does cause a loss of gold in amalgamation. When it appears the stamps should be hung up and the coppers cleaned. This may be done with ammonia, a solution of caustic soda or potash, or a dilute solution of cyanide of potassium. After removal a little more quicksilver should be rubbed in. If it then appears it should be removed as before, all the amalgam scraped off and a good coating of silver amalgam rubbed in. If pure silver can be obtained, this silver amalgam can be easily made by using about three parts of silver to one of quicksilver. It requires about one-fourth ounce of amalgam to each square foot of surface to be amalgamated. If pure silver cannot be obtained, a good way to make it is to use silver dollars. Dissolve them in a porcelain evaporating dish, or any chinaware dish if such be not at hand, in dilute nitric acid, and evaporate it to dryness over hot water, or a water bath. Heat the dry mass gently till it fuses, and all the bluish tinge in it is changed to a grayish black. When this point is reached the copper alloy in the silver coin will be changed to an insoluble oxide. Then dissolve all that will dissolve in a very little water, and filter into a glass jar. To this add the quicksilver required, and drop in a few bright nails or other iron. The silver will be deposited as metallic silver and form amalgam with the quick, and in two or three days it will be complete and ready to use without other care. It is a good idea to always use silver amalgam on the plates, rather than pure quicksilver, because it keeps the surface cleaner and, it is believed, causes a better saving of the gold.

The Coolgardie, Australia, District.

TO THE EDITOR:—Coolgardie was once the chief mining camp in Western Australia. It has met with serious reverses owing to the wildcat contingent and has gone down, notwithstanding it has many excellent mines all round it. Coolgardie grew quicker than any other city in Australia, but as its growth was based on a bubble it has degenerated from a lively mining town into a mere commercial center, which in Western Australia means a carting station on a large scale. Coolgardie had the prospects of a big city until the extension of the railway to Kalgoorlie took away from it the handling of the trade to I. O. U., Kurnalpie, Ejudina, Broad Arrow, White Feather, Menzies and the Northeast Coolgardie district. To Coolgardie Western Australia owes the discoveries of its vast auriferous region.

The aggregate capital of the mines about Coolgardie is £7,000,000, and is distributed as follows:

| Name— | Amount. |
|----------------------------------|----------|
| Bayley's United..... | £155,000 |
| Block 50..... | 225,000 |
| Block 42..... | 150,000 |
| Burbank's Birthday Gift..... | 150,000 |
| Burbank's North..... | 100,000 |
| Burbank's Grand Junction..... | 100,000 |
| City of London..... | 180,000 |
| Flagstaff..... | 240,000 |
| Forest King..... | 75,000 |
| Gleeson's Success..... | 65,000 |
| Golden Leases..... | 120,000 |
| Great Dyke..... | 500,000 |
| Hannan's Gold Estates..... | 750,000 |
| Hannan's Find..... | 90,000 |
| Treasure Trove..... | 90,000 |
| Herbert..... | 85,000 |
| King Solomon's..... | 75,000 |
| Lady Hampton..... | 250,000 |
| Lady Lock..... | 70,000 |
| Extended..... | 150,000 |
| Lily Australis..... | 90,000 |
| Lindsay's Consols..... | 150,000 |
| Londonderry..... | 700,000 |
| McKenzie..... | 75,000 |
| Mount Catherine..... | 300,000 |
| North Burgess..... | 60,000 |
| Rose Hill United..... | 175,000 |
| Sherlaw's..... | 50,000 |
| Vale of Coolgardie..... | 90,000 |
| Wealth of Nations..... | 375,000 |
| W. B. Proprietary Cement..... | 250,000 |
| Westralia and East Extended..... | 200,000 |
| Vincent..... | 75,000 |

The Londonderry, which was the richest mine on the field, is south of Coolgardie one mile. Its discovery and exposure are one of the great episodes of Coolgardie. In the beginning of 1894 two men came into the office of Lindsay, an auctioneer in Bayley street, and asked for information about the country. Lindsay advised them to try Widgiemoolah, sixty miles south. They wanted to try Kurnalpie, but he told them that to men of small means Widgiemoolah offered a better show. They bought from him a condenser and left with a horse and cart for Widgiemoolah. On the 11th of May, 1894, Mills, one of the men, returned and said the country at Lefroy was very dry, but that they were on good feed, and for the sake of the horse they would stop there. He reported that they had what appeared to be an ounce show and asked Lindsay to take up the lease. He called Huxley—his mate—in and they asked Lindsay the charge, saying that they were very poor. Noticing that four other men—who afterwards turned out to be Dawson, Gardiner, Carter and Elliott—were hanging about after the first two named, Lindsay's suspicions were aroused, but subdued when the men frantically attempted to make up the lease money between them. Lindsay brought them to the warden and secured for them lease 575. He took no further notice of the matter at the time. The lease was the Londonderry, which they had discovered on the previous Sunday. However, Lindsay a few days after went into the bush to look for the lease. When he came upon it he found a large fireplace which was evidently not used for cooking. Shortly after he came upon the men, who did not receive him too kindly. By glancing around him he saw that the men had something above the average. The fireplace was used for roasting the quartz in order to facilitate dollying. It appears that Mills, about one week previously, while rapping some stone lying on the surface not far from the camp, had found very coarse gold. A shaft was put down and a very rich find proven. According to the Australian fashion, the men split camp and each set up separately. Although out in the dry wilderness, each camped by himself, cooking and eating apart from his comrades. Each dollied his own gold and made bets as to who should first fill his quart can. As the Australian is a great bettor, these men wagered on a single event, such as filling a quart can, as much as two tins of corned beef, valued at 2 shillings per can. In two weeks they took out 10,000 ozs. of gold. During the two months in which they held the claim they took out over 10,000 ozs. of gold per man—all by mortar and pan. In getting rid of the claim they exercised supreme caution. They had sunk a shaft on the gold to a depth of 50 feet without a sign of exhausting the deposit, but about this time Bayley's Reward, three miles distant, petered out and a panic came. The Londonderry folks sunk a new shaft 100 feet distant from the "golden hole" a depth of 100 feet and drove under the first shaft without finding a trace of gold. They raised up to within 10 feet of the bottom of the shaft with the same result. Then they filled in the workings and

sold the claim on the strength of the golden hole for £350,000. It is said the purchasers, Colonel North & Co., had negotiated for the mine before the work of disproving it was begun. However this may be, the mine was floated in London for £700,000 and one month subsequently was condemned. Colonel North offered to refund the £80,000 he made out of the flotation to shareholders, but died soon after, and his heirs refused to fulfill his promise. A curious fact about the mine is that the quartz beyond a foot outside the golden hole was as barren of gold as marble. The mine was simply salted by nature, as a great many others are here.

Bayley's Reward, now known as Bayley's United, was discovered by Arthur Bayley, an American. It was the first claim located in the Coolgardie gold fields, and, next to the Londonderry, was the richest. Bayley was twenty-six years old when he discovered the claim and had been prospecting in the desert three years before. He came from Nevada and southern California, where he had made enough money as a miner to fit him up with camels and provision him for the time he was prospecting here. After Bayley struck the claim he journeyed ten miles back on his tracks to find a man with whom he had traveled some time, but who did not care to go farther into the country with him. Finding the man, he induced him to return with him and had him go to Southern Cross to record the claim in their names and procure provisions. A few weeks after the fellow left four others—Reddy, Hannan, Burke and Lawton—appeared on the scene and attempted to take the claim off Bayley, but Bayley chased them away with a display of revolvers. Subsequently Bayley's mate returned and, as Bayley did not like his ways, he, too, was run off the premises. Bayley, by strategy, succeeded in obtaining the claim as a reward, and afterward learned that his mate had failed to lodge any application for the claim. That is how "the American swindled his mate out of interest in the property," as they say here. Bayley took £30,000 worth of gold out of the mine and sold one-fifth of it for £30,000 more. The mine was worked out in three months. Its prospects now, although £100,000 has been spent on it, are poor indeed.

Burbank's Birthday Gift is the best mine on the Coolgardie gold fields. So far it has crushed over 6000 tons for an average yield of 3 ozs. per ton. It is situated fourteen miles from Coolgardie. A 10-head mill is on the mine. The reef is proven to 200 feet depth and on the 100-foot level has been driven on 500 feet. There is a slight fault in it above this level, but it behaves well otherwise. The manager is a respectable old professor of geology, who does not understand the theory of praising a mine before it is proven, but believes one consistent dividend payer is worth a hundred wildcats in even the shortest run.

The Wealth of Nations is thirty miles northeast of Coolgardie, and was the scene of the greatest alluvial excitement in Western Australia. Over £100,000 worth of gold was recovered from the surface of the mine before it was floated. It was floated on the strength of a mining expert's opinion that all this gold was shed from the reef. The reef had very little sense to have moulted itself so bare, for it has not enough gold left in it to identify itself. A 10-head mill was erected on the claim two years ago, but has not as yet turned a wheel owing to lack of water, which, I think, if found, would have been unwelcome. Two months ago payable gold was reported to have been struck in the mine and a month later water was found. These were two strokes of luck at the same time, evidently, but as the mill has not been started yet I fear the strike of water was unlucky. I regret to say I am of the opinion that this mine will never pay for the candles that have been burned in it. Nearly £100,000 have been spent on the mine.

Lindsay's Consols in Coolgardie was a good mine. It has crushed 3000 tons for 12,000 ozs., and continues crushing, but I am afraid the reef is disturbed to an extent bordering on disappearance.

The Golden Dyke crushed 5000 tons for an average of 10 dwts. per ton, but found it unprofitable. There are many other mines like it here. The Australian mining man's knowledge of mining is extremely limited, and in Western Australia he is a complete failure. The reason of this is the fact that he is used to obtaining labor so cheaply that he need never think of economizing on labor.

All the successful mines of Western Australia are superintended by Americans. The country is peculiarly adapted for American ideas. The rate of wages given miners is about the same as in America. Australians are used to paying white miners less wages than are paid Chinese miners in America. They are utterly unable to work a 10 dwt. mine at a profit where wages are more than 10 shillings per day, because they are incapable of economizing on labor otherwise than reducing wages. Their knowledge of labor-saving machinery is nil. When they leave the older colonies to come to Western Australia they carry with them the same ideas their fathers had before them. Having been used to employing three or four men at 6 shillings per day to dump each car of dirt raised from the shaft, they do the same in Western Australia, where each man receives

14 shillings per day. Shafts in Victoria 3900 feet deep are only 6 feet by 3 feet in the clear, and less than 50 tons per day can be raised from them. The gallows-frames on such shafts are so fitted that it requires three men besides engine driver to take a load of rock from the cage. When retrenchment is necessary in such mines, instead of putting in appliances that will do away with two men, they reduce the wages of the three. This is an easy matter here, because the miners are as inferior to those in America as the managers are to American managers. Economy on material is practiced with a vengeance here by Australian managers. Miners are required to go to an office for candles before going on shift, and are allowed two candles per shift. If the candles are consumed during the shift, the miner is supposed to work in the dark. Progress is not noted, but the expense for materials is always under the glass. Mining labor in Australia is altogether dearer than in America, notwithstanding that the wages are not half as high. Supervision is what costs.

When the Australian manager can make only 6-dwt. stone pay in Victoria, with white miners at 6 shillings per day, it is not surprising that he can not make 10 dwts. pay in Western Australia, and therefore can not see how to float a mine except by exaggerating the value of its ore, whose true value would satisfy an American. There are several mines here which would be considered good in America. Burbank's Grand Junction, Burbank's North, Vale of Coolgardie, North Burgess, Sherlaw's, Westralia and East Extended are all mines of good prospects.

JOHN DWYER.

Mexican Methods of Mining.

The way which mines in Mexico have been worked by Mexicans may be divided, roughly speaking, into two classes, those that have been systematically worked without development, and those that have been systematically developed. Many native companies have worked and are now working, which, for economical management and results obtained, compare favorably. For the last 350 years the inhabitants of such places as Guanojuato and Zacatecas have lived by mining alone; the whole prosperity, and, indeed, the very existence of these places and others like them depended upon their mines. The modus operandi of a typical Mexican mining company in successful operation is as follows:

Direction.—This is in the hands of five directors, a president, a treasurer and three members elected by the shareholders of the company from among their own number. The president holds the power of attorney for the company, has ample powers to direct the working of the concern and appoint all employees; he is supposed to consult the other directors at least once a month, and expected to visit the mine and reduction works not less than once a week. The president and treasurer are remunerated for their services by a percentage of the dividends, and in some cases the treasurer is allowed the salary of an accountant.

Mining Staff.—This consists of the manager, with a young engineer as assistant, a timekeeper, a storekeeper, and the captain of the ore yard, besides blacksmiths, carpenters, stablemen, masons, watchmen, etc., on the surface; and underground, of a mine captain, with two assistants, or two captains, a day and a night one, a foreman of the carriers, and a man in charge of the tools.

Development.—This is by a vertical shaft designed to intersect the lode a certain depth, generally from 600 to 700 feet, from which crosscuts are driven to the lode at intervals of 100 feet or more, according to circumstances, and horizontal drifts made along it with crosscuts into the country rock on the foot and hanging walls, where such are deemed advisable, and winzes communicating the different drifts. From a convenient point, preferably on the outcrop of the lode and differing in level as much as possible from the mouth of the shaft, a series of winzes to serve as a railway are made into the mine by which all the men enter and come out, none being allowed to do so by the shaft except under exceptional circumstances. Sometimes it is subsequently found necessary to sink one or more shafts, and of late years a preference for inclined ones has manifested itself. The drifts and crosscuts are generally made 2 m. high by 2 m. wide, and are paid for by the running meter, the price being fixed every week by the manager, four couples in two shifts being employed in driving them; only very occasionally in cases of urgency are six couples in three shifts employed. Sometimes crosscuts are contracted out to only two couples working one by day and one by night; they are then expected to be 2 m. high by 1 m. wide. In the best managed mines in the Zacatecas district and generally throughout the country the mine provides and keeps in repair all the tools, and supplies lights, explosives and all other materials required for the work; in some places, however, the men have to find themselves in everything, even having to sharpen their own tools—a very fruitful source of waste of time.

Drainage.—In pre-railway days only a few mines

were drained by steam power, the usual method being by horse whims, with large bags or pouches made of rawhides with an iron ring at the mouth. This method was adequate in most cases, as water is not very often found in great quantities in Mexican mines; when it was, or when a mine was deep, the alternative often lay between the adoption of steam and the suspension of work. The cost of steam engines was so great, the difficulty of transport and getting men to properly attend to them so disheartening, and the wood fuel often so scarce and dear that native companies very seldom had them. The whims have a horizontal arm about 3½ feet above the ground, to each end of which two horses are hitched; to reverse, the horses have to be unhitched, turned round and hitched to the other end of the arm. They occasionally get beyond control, flying round with terrible velocity, the horses being nearly always killed, and the drivers not always escaping. Whims with diagonal arms starting from the top of the axle were introduced some years ago, with which it is not necessary to unhitch the horses to reverse, as they can be turned round by passing under the arm, and yet the pull is at a point sufficiently low to enable them to exert their full strength. When a considerable quantity of water has to be combated, the horses are kept going at a gallop, and so hard is the work that the ground is sometimes wetted by their sweat and turned to mud, and if they are to be kept in good condition they cannot be worked for more than two out of the twenty-four hours. Much use has not been made of adits, because the hill slopes, although steep near the top, are generally not so near the base, and sufficient depth can seldom be obtained without making them very long.

Extraction.—Mexican miners nearly always work in couples, one striking with a two-handed hammer, and the other holding and turning the drill. When employed on the extraction of ore they are paid either with a part of the ore they extract, on the amount of ore extracted, or by the holes drilled. To work out an ore body they prefer to attack it at the top, and work downwards on it, alleging that the increased power that can be put into a down stroke in drilling with the heavy hammer more than compensates for the smaller quantity of stone that is loosened by the blast. The ore is taken from the workings to the shaft on the backs of the carriers, the worthless stones or deads being used as much as possible to fill up old workings, the very rich ore being put in bags before it is taken to the shaft. Each carrier fills his bag with the smaller stones, piling the larger ones on the top, and balances it on his back by an endless loop—part of which is of leather about 2 in. wide—passed round it and resting on the top of his head leaving both hands perfectly free. The weight of stones usually carried by men is from 200 to 250 pounds, but there have been instances of men carrying much more.

Ore Yard.—The ore and stones are hoisted by horse whims, packed in leather pouches, which are emptied at the mouth of the shaft, from where it is taken to the ore yard on wheel or hand barrows. The ore extracted by each couple or set of couples is accompanied by a bag full of the same, having a distinctive mark made of knotted, plaited, or twisted string. These marks are very simple and ingenious, having distinctive names, and are further varied by the part of the bag to which they are attached. They can be divided into groups, and when assigning marks to the men, care is generally taken to confine each group to one part of the mine, and to the men working under similar conditions, so that in the ore yard the part of the mine from which the ore was extracted, and the conditions under which the men who extracted it worked, is at once known. If there are any tributaries at work in the mine the ore extracted by them is put in one part of the yard, and when it has all been hoisted they are called in to divide it into two, three, four, or more equal parts, according to the conditions on which they work, the most usual being two-thirds to the mine, and one-third to the men. The ore is broken, hand-picked, sorted into different classes and weighed, the breakers being paid by the amount they pick, the captain taking care that bad stones are not passed or good ones thrown away.

Assays.—A sample of each of the classes into which the ore is sorted is taken and assayed every week, and besides this four samples are taken of the ore from each heading and working in the mine—one from the coarse gravel made at the time the ore is broken in the yard, another from the fine, and two more from the gravels that come out of the mine with the ore, the coarse gravels being in both cases hand-cleaned first. Samples taken in this way have been found to be reliable and to give a good idea of the values of the ore found in the different parts of the mine.

Reduction Works.—Before the introduction of modern methods the reduction of the ore was carried on in completely separate establishments, often at a considerable distance from the mines, to which the ore was sent on mule or donkey back, or in carts. The method of working the mines thus described, crude though it may appear, is well suited to many Mexican mines. As a rule the pay ore found in them is intermixed with worthless vein stuff, and

seldom in large compact bodies, every part of which is rich enough to cover the cost of reduction; even in the large rich chimneys and pockets that have given big "bonanzas," a quantity of worthless ore has been found mixed with the good ore, and with labor so cheap and hand-pickers so expert, a considerable economy is effected by separating the unprofitable part. Nor is the use of steam power always accompanied by economy; coal is unobtainable in the majority of places, and wood fuel is generally dear, skilled labor difficult to obtain, and to repair or replace breakages, long and vexatious delays are only too likely to occur. On the other hand, horses are cheap. Mexicans skillful in managing them, and, for the working of an ordinary mine, efficient. In reduction works, however, the advantages of steam machinery very far outweigh the difficulties of its employment.

Ward District, Boulder Co., Colo.

The accompanying illustration is that of Ward, Boulder county, Colo., which, as a mining town, is enjoying a good normal condition of activity. The most important achievement of the year has been the completion of the Colorado & Northwestern railway from Boulder to Ward, which not only makes travel to the latter point quicker and more convenient, but makes possible the shipment of low-grade ore from the mines of the Ward district at a small profit.

From Boulder to Ward is a distance of fourteen miles in a straight line, but the mountainous character of the country requires various circuits and

WARD, BOULDER DISTRICT, COLORADO.

curves which lengthen the line to twenty-seven miles. In this distance an ascent of 4000 feet is made. At Boulder the new road connects with the U. P., Denver & Gulf line.

Two well-equipped reduction plants are in operation at Boulder. A rate of \$1.25 per ton on low-grade ore is made from Ward to Boulder by the new road and a \$2 rate on high grade. The shipments at present from Ward are of considerable account. It is claimed that ore of as low grade as \$4 per ton can be shipped from Ward profitably.

In the adit tunnel an upraise is being driven to the upper Dewdrop workings, a distance of 300 feet. The tunnel being driven by the Big Five company to the Ni Wot workings has progressed 2760 feet, set with double track. One thousand feet of this distance is on an ore body of good width. The Big Five is just completing a power plant, having 160 H. P. boilers, 125 H. P. engine and a 15-drill compressor. The B. & M. is well opened from a 550-foot shaft, having good bodies of profitable ore.

The Morning Star, under the management of Wm. Crompton of Boston, is making a good record in the shipment of high-grade ore.

The Worth mine has shipped ore of the value of \$30,000 within the last three months.

The U. P., which has recently been opened, has put in a new plant of machinery.

The Utica lost its shaft house by fire recently and will rebuild at once.

Ward, Colo., Aug. 20th, '98.

WASCOTT.

In 1880 the United States exported iron and steel to the value of \$14,716,524; in '97 this nation's iron and steel exports were valued at \$70,367,527. In '80 we imported \$71,266,699 worth of iron and steel; in '97, \$12,615,913; so that in seventeen years Americans have secured nearly all the home market for iron and steel and nearly five times as much foreign business as in the year first named.

Is Darwinism True?

W. S. PROSSER.

In an article in the MINING AND SCIENTIFIC PRESS (April 2nd, '98) I gave several reasons for dissenting from the Darwinian theory of the common descent of man and other animals; but that article was in such a brief and concentrated form that it seems desirable to enlarge somewhat upon some parts thereof.

First—Is there any such thing in actual operation in nature as a development of new forms by "natural selection" or a "survival of the fittest?"

Second—Is it impossible to conceive of any natural process by which new ideas and novel devices can be introduced into animal mechanics?

Third—The explanation of vestigial and embryonic reminders of earlier forms.

It has never been shown that a distinctly new animal species has evolved itself from another not so good; but it has been assumed and believed, because some variation constantly appears. The planets vary in their paths continually from greater to a less degree of ellipticity, travel at different speeds at different seasons, and are subject to many regular perturbations. Astronomers might, from one of these variations, continued for a month or a year or many years, theorize that the change was continuous, and would increase till the solar system was wrecked, or the planets rushed off into space as comets; that these variations were not cyclic, but permanent and increasing. Such is the position of Darwinism.

In studying evolution, those variations occurring under man's influence must be totally cast aside, if

any hope is cherished of discovering the true history of nature in past ages. Man is a new force, not in ancient times in action. A horse moves a wagon along a road, now here, now there, as his driver wills. That is variation under domesticity. But that affords no clue as to the effect of different forces, as chance winds, to-morrow's tornado or next day's zephyr. They would illustrate chance variations. In the calculations of probabilities, variation by chance leads nowhere. To consider changes under domesticity would not alter the final result—no truth could; but it delays and befogs the mind. The Darwinian argument is that from a little variation under man a great deal more under nature may be assumed; and thus great changes might have occurred, and hence, as the next step, that they did occur. All of which is unjustifiable reasoning. Because pigeons and dogs have, under one force (domesticity), changed in size, color, acuteness of smell, etc., affords no basis for assuming that wild animals, entirely free from that force, may and did change much more—did of their own volition invent and introduce new, strange and wondrous mechanical devices. Certainly food, heat, cold, etc., may alter the general size; exercise will increase parts especially used. Good food carries good blood over the body to each organ, and all grow. Those most used get the most blood and grow the most. But how could this blood, either in the embryo or in the perfected body, create, or lay the foundation for creating, a thousand years later, a new organ, a new mechanism, designed and built on unknown and hitherto untried principles? The thing is absurd.

Survival of the fittest is a very pretty idea. It looks plausible to set out in long array the manifold dangers that surround animal life, destroying most of the young and finally all lives, and to ascribe the long lives of some to their swiftness, strength or hardihood. The argument is simple: those who live are assumed to be the stronger and those who early

perish the weaker. The reasoning is poor, and it is not backed by facts. Many more lives are begun, especially in the lower forms, than reach maturity. Generally the smaller species are very fecund and furnish the food of the larger. The cod, mackerel, etc., produce tens of thousands of young, of which very few mature. How are these few selected? Are they the strongest and swiftest? Not at all. They are of the average. Their enemies, for the most part, are so large and swift that any minute difference in the little ones cuts no figure. At the first rush the nearest are caught, the remoter escape. In a mass some must be on the edges at one moment, others the next moment. Those that escape to-day may be the first to fall to-morrow. It is a matter of chance. A shoal of herrings is surrounded by swift enemies who catch those on the edges or in the center at will, or if confining themselves to the edges are as apt to catch the very fast as the very slow, as either would separate them from the main body which travels here and there, back and forth, now the pursuer in front, now behind. Even if one straight flight be imagined, the average must escape as well as the fastest. Thus, everywhere, the sick, deformed and feeble are quickly killed; the average and those slightly above or below the average have practically an equal show, and their numbers are reduced by chance operation of highly superior forces to the usual amount. These herrings show in every shoal and from year to year substantially the same speed, which would not be the case if any selection of the swiftest were going on. It may be said that this has happened and that they are all swifter than aforesaid. But of this there is no proof, and this disproves: that in that case they would have so gained on their enemies as to be safe from them, and, if so, would have increased beyond all bounds, even to filling the ocean. To avoid this, another assumption may be made: that their pursuers have all increased, which involves increase in their enemies, and so on, and the net result would be the same as no increase. If similar causes produce similar results, all species must have advanced. This is a necessary and integral part of Darwinism, and the result should be a great vacancy at the bottom of the animal series. If not, why not? If some survived before they were the fittest, then the others died, and there was an advance, leaving a gap behind. The same process continued would present to us at last a few high races and no low ones. Or perhaps it may be preferred to say that some survived because they were "fittest," but the others survived anyhow! A clear absurdity.

One great safeguard of the deer is its speed. Adult deer are sometimes caught by carnivora. These lie in wait, usually, and their choice of a victim is from chance; and relative or actual speed cuts no figure, except that the sick, aged, malformed and feeble fall easy victims and thus prevent a falling off in the average of the species. But those in fair average health have the same chance as the best. Other enemies are diseases, parasites, accidents, etc., wherein individual strength and speed are of no avail. Disease among wild animals, except when overcrowded, is the exception. What, then, is the real meaning of speed, color, acute hearing, smelling, etc., as safeguards? Plainly, that they prevent wanton and needless killing. Only hunger will drive their enemies to the exertions necessary to capture. What otherwise would happen is shown when a sheep-killing dog has a night's sport in a helpless band. Even in mankind disease, accident and death overtake the strong as well as the weak. Disease germs that to-day are harmless to a certain one, to-morrow may find him an easy victim. The race, as all races, survives at about its average, and no especial survival of the fittest is visible. If the human race advances it is because of a general advance, in the great body and not from a few exceptional individuals. A noble life helps the race mostly by example; the direct descendants may be villainous.

One Darwinian argument is this: On a piece of ground, covered thickly by young plants, all of a kind, most soon die, and only a few finally grow to maturity and occupy the entire space. This is supposed to show a selection of the best. As a certain writer says: "The strongest, loftiest and hardiest survive and thus makes par excellence among trees." This is another example of poor logic. The position of the seeds in the ground is entirely by chance. Only one plant in about eighty so far can grow on account of sunlight and plant food, and the subsequent crowding out would be chiefly the same requirement of distance, modified to some extent by accidental variations in fertility of soil, the feet or teeth of animals, worms, storms, etc. In all this selection, relative hardness or the plant's internal structure has nothing to do, and the competition, such as it is, instead of "making par excellence," as imagined, does exactly the reverse—damaging the survivors by stunting their early growth. In plant life, as in animal, there is no "survival of the fittest," as an actual evolutionary force.

Darwin's opinion that an animal's worst competitors are those of its own kind is true only to a limited extent, in case that food is scarce. It is not true usually, because food is usually not scarce. Bateson, quoted by Prof. Herdman, F. R. S., etc., concludes, collating known observations, that varia-

tion is discontinuous. It is, perhaps, truer to say that variation is cyclic, returning always to the average of the species, as planets continually return to the average of their orbital paths. As gravity, an unknown power, compels this latter, so does an unknown power compel the former. An accumulative, or continuous, variation is an idle dream. Thiselton-Dyer, F. R. S., etc., does not find that "plants inherit effects of environment." Bonnier says: "Plants transported from Alps to plains, or vice versa, and returned, return to their original condition." Prof. Van Graff lauds Darwin, yet owns that there are "puzzling phenomena" not yet explainable. He quotes Nageli that "there is a sharp distinction between multiformity and variation," and hopes future naturalists will so study zoology as to "evolve a causal science resting on an experimental basis," which means, I suppose, to substitute science and fact for theory and guesswork. More frank is Wallace, the co-originator of "natural selection," who confesses that it breaks down as an explanation of the mathematical, artistic and musical faculties of man, "whose development in civilized nations has been so sudden and so great."

In war the brave and strong go out to fight. If killed, or weakened by privations, both effects ought to show in national deterioration. In nations much given to war these effects ought to be very great. But the contrary is the observed fact. War is not only the mother of patriotism and the nurse of courage, unselfishness and the high virtues, but of physical vigor as well. Show me a nation continually at war—serious war—and I can show a vigorous race. The old Greeks fought each other for centuries and continually killed their best, yet they hammered the race into the most perfect ever known. So the Romans: the faster they killed their best, the stronger they grew; when they ceased to fight, they rotted.

(To be Continued.)

The Functions of Alkalies in Cyanide Treatment.

Saving of Cyanide.—Possibly the most important and certainly the most obvious reason for the use of alkalies in cyanide treatment, says a correspondent of the *South African Mining Journal*, is to economize cyanide by neutralizing acid, free and latent, and acid oxy-salts of base metals in the material treated. This saving they accomplish to a certain extent, but not altogether, as a charge, though rendered thoroughly alkaline, will yet, if it contain the reducing substance ferrous hydrate, consume cyanide by gradually converting it into potassic ferrocyanide. Oxidation, which converts ferrous hydrate into innocuous ferric hydrate, should naturally follow the preliminary alkaline treatment of acid material. With leachable material this may be effected either by draining the charge dry and allowing air to penetrate into the interstitial spaces, or by exposure to the air during transference to another vat. Slime pulp may be aerated by pump circulation or by the application of air from a compressor. The expenditure of time and power required for this oxidation preliminary to addition of cyanide must be set against the saving in cyanide thus effected. In other words, it must be decided in each case whether it is cheaper to convert the ferrous hydrate into a harmless compound by means of oxygen or potassic cyanide. Either lime or caustic soda may be employed as alkalies, but the latter is liable to induce turbidity in the solution leached off; it also retards free percolation, and in the case of slimes delays rapid settlement. Lime has the opposite effect, and is thus generally preferable. The main difficulty in the use of lime is its slight solubility in water, so that in order to gain high efficiency it is necessary for it to be distributed in a fine state of division throughout the material to be treated. In dry crushing or direct cyanide treatment the lime can be added before sieving, whilst in wet crushing sufficient lime may be added to the trucks of ore entering the mill to render the water leaving the plates just alkaline. This practice has the further advantage of assisting amalgamation by neutralizing any acid in the ore which would otherwise tend to discolor the plates.

The alkalinity of water or cyanide solution may be calculated (in terms of caustic soda by titrating 100 c.c. with decinormal acid, using a few drops of a .5 per cent solution of phenolphthalein in methylated spirits as indicator. Each c.c. of decinormal acid employed is equivalent to .004 per cent alkali. In the case of cyanide solutions the free KCy must first be neutralized with silver nitrate solution before making the alkali determination. The decinormal acid may be readily prepared by dissolving 6.3 grains pure dry oxalic acid in distilled water and making up to a litre. A simple method of estimating the amount of available CaO in commercial lime, suggested by Mr. A. F. Crosse, is to place a gramme of the very finely ground sample in a litre flask, fill up with distilled water, and close. This is left for several days with occasional shaking, and, finally, 100 c.c. of the clear solution are titrated with decinormal acid. Each c.c. of decinormal acid employed is equivalent to 2.8 per cent pure CaO in

sample. Magnesian oxide is a useless constituent of lime, so far as cyanide treatment is concerned, as any $MgSO_4$ formed decomposes cyanide as readily as H_2SO_4 .

In a sands plant, or when ore is treated direct by cyanide, sufficient lime should be added to the material treated to maintain the average alkalinity of the solution after precipitation contained in the storage vats at about .02 per cent. By these tests and by daily tests of alkalinity of plate water, the amount of lime employed may be adjusted to the character of the ore. A further effect of the presence of free alkali in the solution is, as experiments show, to conserve the cyanide by neutralizing the carbonic acid from the air, which would otherwise tend to decompose the potassic cyanide.

Flocculating Properties.—The effect of alkalies as regards flocculation and settlement of slimes is analogous to their effect upon percolation; in the latter case the passage of a liquid past a finely divided solid takes place, whilst in the former case the operation is reversed. For slime treatment lime is universally employed to accelerate the settling, which caustic soda actually retards. This lime does by causing the agglomeration into aggregates of the finely divided suspended slime particles, and thus, by increasing the bulk relatively to area, reducing that friction with the particles of liquid which retards their settlement. The solution storages in slime plants should be kept up about .010 per cent alkali by the addition of lime to the slime pulp undergoing treatment. I have been unable to detect any acceleration in settlement by the presence of more than .007 per cent alkali, but .010 per cent allows of a margin for consumption by the carbonic acid of the air.

To settle slimes in spitzkasten, which receive pulp from the mill, after separation of concentrates and sands, and to return clear water direct to the mill, lime should be added as far up the launder and as far away from the spitzkasten as possible. It is best fed into the launder by means of an automatic traveling belt feeder, suggested by Mr. E. T. Rand, which is driven by a little waterwheel placed in the launder itself. The belt travels just above the bottom of the hopper containing very finely ground lime, and constantly delivers into the stream an amount of lime which may be regulated by a sliding door over the opening in the hopper from which the belt issues. The fineness to which the lime has been ground and the length of launder it traverses before reaching the spitzkasten determine the percentage actually dissolved, upon which its efficiency depends. The lime is usually ground in a ball mill with 30-mesh or 40-mesh screening; if lime is used in the mill very little more need be added later to ensure slime settlement. Owing to its power of accelerating percolation a high percentage of mill pulp can be retained in the sand collecting vats as a leachable product where lime is employed in the mill. A saving of the time necessary for free cyanide, when the solution is applied, to come in contact with all parts of the charge also results, and as the subsequent washes leach freely, the dissolved gold is readily washed out, thus giving low residues after treatment.

The overflow of clear water from the spitzkasten need not contain more than .003 per cent alkali if the spitzkasten are of sufficient capacity and properly regulated as regards baffle boards to prevent disturbance by surface currents or by wind; the overflow should be perfectly level and equable, and several inches depth of water should be maintained above the angular edges of adjoining spitzkasten. Slimes from oxidized material are less readily settled than those from pyritic ore, and in such cases somewhat more than the ordinary allowance of alkali and of twelve square feet of spitzkasten per ton of slimes per twenty-four hours may be necessary to effect such concentration of the slimes as would separate 75 per cent of the pulp water as a clear overflow.

Prevention of Rust in Iron Vats.—It is stated in *Comey's Dictionary of Solubilities* that "iron does not rust in contact with air and water containing alkalies even in every small amount." The coating of calcic carbonate, which solutions containing lime tend to deposit on every surface with which they come in contact, would also probably tend to prevent oxidation, and similarly this deposit should lessen and finally stop leakage from small crevices in vats through which calcareous gold-bearing solution was constantly finding its way.

In Boston, Mass., last Tuesday, before the American Association for the Advancement of Science, now in annual session there, C. B. Rush read a preliminary paper on "A New Gas." This is a constituent of the atmosphere, and is found absorbed in many instances. Its chief characteristics thus far experimentally determined are enormous heat, conductivity and low pressure. Mr. Rush showed that its conductivity, even when mixed with a larger excess of other gases, is about 100 times that of hydrogen, the best gaseous conductor heretofore known, and conjectures that the conductivity of the pure gas will be found 1000 or more times that of hydrogen. Mr. Rush claims to have discovered the new gas a year ago whilst looking for secluded hydrogen in gas.

Coast Industrial Notes.

—The White Pass & Yukon Railroad is open for business.

—On the S. F. & S. J. V. R. R., track is laid to Tulare, Cal.

—The Nicaragua Canal would "boom" Pacific coast lumber interests.

—From nine acres J. N. York harvested 742½ bushels of barley at Weston, Oregon.

—Freight rates from the Pacific coast to New York on lumber and shingles are 88 cents.

—Hop contracts at Gervais, Wash., amount to 850,000 pounds, a price from 7 to 10 cents a pound.

—From Aug. 19 to 23 fruit shipments to the East from Sacramento, Cal., amounted to 161 carloads.

—It has been decided to extend the Sierra Railway twenty miles from Jamestown, Cal., to the sugar pine belt.

—Fifty-seven carloads of sheep—over 6000 head—were shipped last week from Porterville, Cal., to Griswold, Iowa.

—The Philippines are not Spanish territory to be disposed of by a protocol. They are United States territory by conquest.

—The San Diego Union says that tobacco raising in San Diego county, Cal., is a success. Some of the plants are 7 feet high.

—Mexico has twenty-one blast furnaces in operation, two in course of construction, seven rolling mills and two partly finished steel plants.

—By Nov. 1st, '98, the Snoqualmie Falls Power Co. expects to have its plant in operation and be furnishing electric power in Seattle, Wash.

—The first steamer of the California & Oriental Steamship Co. will sail from San Diego, Cal., for Japan and China, via Honolulu, in December.

—At Baker City, Oregon, the local sales of wool to date aggregate 75,000 pounds, all of which has been consigned to Eastern buyers. The price realized was 12@12½ cents per pound.

—The annual revenues under Spanish rule in the Philippines amounted to about \$10,000,000. The annual exports from the islands amount to about \$20,000,000 and the imports to \$10,000,000.

—The first railway cars to be used in Alaska were shipped to Skagway this week. They are to be used on the White Pass & Yukon Railroad, which is now in operation twelve miles from Skagway.

—Next Thursday the Pacific Coast Co. makes a general advance in the wages of its employees in the mines at Franklin and Newcastle, Wash., averaging about 10 per cent. About 600 men are employed.

—In Trenton, N. J., the Polynesian Steamship Co. has incorporated to operate a line of steamers between San Francisco, Honolulu, Tahiti and probably Manila. Capital stock, \$1,500,000. Two 3000-ton steamships will be built.

—The Chihuahua, Mexico, *Enterprise* says that the demand for livestock in the U. S. has almost depleted the herds of northern Mexico, particularly Chihuahua and Sonora, the shipments amounting for some time past to 6000 head a month.

—The Esquimalt, B. C., Marine Railway, Ltd., have sold their entire plant and ship-building business to a company which has been formed under the name of the British Columbia Marine Railway Co., incorporated with a capital of \$200,000.

—Oil from Coalings, Fresno Co., Cal., is sold at \$1.30 per barrel, delivered in San Francisco. The cost of transportation is 42 cents per barrel, leaving a net return of 88 cents per barrel to the producers. Four wells yield 540 barrels per day.

—At La Grande, Oregon, \$500,000 beet sugar factory is rapidly nearing completion. Over 5000 cords of wood have been piled up on the factory site. Over 150 men are at work on the buildings, and setting up machinery. When the factory starts it will give employment to 100 persons.

—The contract for the construction of the San Pedro, Cal., breakwater was signed Aug. 12th by Heldmaer & Neu, the contractors of Chicago, and Major Charles E. L. B. Davis, United States engineer, representing the Government in San Francisco. Work begins three months from the date of signing.

—The Kootenay Railway and Navigation Co., Limited, has been formed to consolidate into one system the Kaslo & Slocan Railroad and the International Navigation and Trading Co., Limited, and to connect these directly with the Great Northern and Northern Pacific Railroads by a line either owned or controlled by the company. The capital is \$500,000.

—H. C. Pettit of Snohomish, Wash., is a born trader. He reached Dawson last fall \$200 in debt. He sold his padlock to an old miner for \$20, and going back bought all available padlocks of incoming Klondikers, which he sold at Dawson for \$20 each, clearing \$700. Then he began speculating in Klondike claims and is now back from London, where he sold his claims for \$200,000.

—The San Francisco Chamber of Commerce and the Manufacturers' and Producers' Association of California have both telegraphed to the Saratoga, N. Y., National Conference on the future foreign policy of the United States, urging that the Government retain all the territory conquered in the late war with Spain, and also strongly favoring the building of the Nicaragua canal, and its control by the U. S. Government.

—The report of the Iron Mountain Railway for the year ending June 30th, '98, is not invigorating from a transportation point of

view. The Iron Mountain Railway runs from Iron Mountain to Keswick, in Shasta Co., Cal., a distance of eleven miles, and is operated almost entirely as an ore road in connection with the Iron Mountain mine. The operating expenses of the road for the year are shown to be \$65,118.33, and the total earnings, which were in the shape of freight receipts, amounted to \$178.55, leaving a deficit of \$64,939.78. Still, in connection with the smelting operations, the railroad is a paying investment.

—Consul Denby arrived in San Francisco on the steamer Belgic this week from Peking, China. He says that several important contracts relating to the development of China have recently been entered into by the Chinese Government. A contract has been made by the Russo-Chinese Bank for a railway, 140 miles long, from Tai-yu-an-fu, the capital of Shansi province, to Cheng-ting-fu in the province of Chihli—the first large city south of Pao-ting-fu, the capital of Chihli. Pao-ting-fu is on the trunk line from Hankau to Peking. This contract also includes mining privileges and the building of necessary branch roads. A contract has been granted to Mr. Luzatti, agent of an Anglo-Italian syndicate, for working coal, iron and petroleum throughout central and southern Shansi, with the privilege of building railways and cutting canals to join trunk lines or navigable rivers. The contract runs for a period of sixty years, and is entirely vested in the Anglo-Italian syndicate. This is the greatest industrial concession ever made by China. The engineers and staff are to be composed of English and American engineers. Two American engineers—Messrs. Jameson and Shockey—have visited Shansi, and they report that the minerals are inexhaustible and as yet almost untouched. Consul Denby is credibly informed that the Hankau-Canton line has been granted to an American syndicate. A contract has also been granted H. H. Lowry, an American, to operate, in conjunction with a Chinese company, the coal mines west of the city and to build a railroad to Kaigan, conditioned on the raising of 10,000,000 taels (\$6,730,000).

Personal.

J. P. BOYLE is appointed Supt. Valeo mine, Park City, Utah.

T. MCINERY is Supt. Spenezuma M. Co., Black Rock, Ariz.

P. C. DUPUIS, Supt. German mine, El Dorado, Cal., is in San Francisco.

A. S. GRAHAM has resigned as Supt. of the Lily mine at Columbia, Cal.

ROGER PRENDERGAST succeeds D. B. Lyman as Supt. Union Con., Nevada.

L. DE TOURNIEL is Supt. Argus G. M. Co., Snows canyon via Modoc, Cal.

S. B. MILNER succeeds J. Gray as Gen. Mgr. Dexter mine, Tuscarora, Nev.

F. L. RATHBUN, Supt. Ranch mine, San Andreas, Cal., is in San Francisco.

WM. VAN SLOOTEN, New York City, is at the Mountain mine, Sierra City, Cal.

CLARENCE KING is inspecting the Summit mine, Nevada City, Cal., district.

W. A. HAWLEY, a mine owner of Grass Valley, Cal., is at Grants Pass, Oregon.

W. F. DETERT, Supt. Zeila mine, Jackson, Cal., has returned from San Francisco.

M. W. GIBBONS of the Kasser G. M. Co. has returned from California to Globe, Ariz.

W. B. NEAL of Pittsburg, Pa., is visiting his Lucky Boy mine at Idaho City, Idaho.

A. R. TOWNSEND of Chicago, Ill., is examining mining properties in Calaveras Co., Cal.

J. M. LAKENAN, managing owner Wisconsin mine, Grass Valley, Cal., is in San Francisco.

A. McMAHON JR., Supt. Live Oak mine, Columbia Hill, Cal., has returned from San Jose.

PROF. F. A. C. PERRINE of Stanford University has returned to California from New York.

C. R. KELSEY, Mgr. Mountain Home M. Co., Mountain Home, Idaho, is in Salt Lake City, Utah.

F. DULMAYNE, owner of La Normandie mine, Grass Valley, Cal., has returned from San Francisco.

J. E. JACKSON, Salt Lake City, Utah, Mgr. Kansas City auro-cyanide sampler, is in Spokane, Wash.

W. H. RADFORD, Supt. La Grange hydraulic mine, Weaverville, Cal., is visiting his family at Berkeley, Cal.

BARON E. DE LA GRANGE has returned to San Francisco from his mining properties near Weaverville, Cal.

H. L. SWAIN, Supt. Ibarra mines, Calmali, Lower California, has gone to Santo Domingo for a brief sojourn.

J. SALLEE, managing owner Bully Hill copper mines, Copper City, Cal., has returned from San Francisco.

F. KLEPETKO, Gen. Mgr. Boston & Montana M. Co., has returned to Butte, Mont., from Salt Lake City, Utah.

W. P. DUNHAM, the Mineral Creek mining man, has returned to Florence, Ariz., from Chicago and St. Louis.

GILBERT MC M. ROSS has been appointed Supt. Con. Cal. & Va., Ophir and Mexican mines on the Comstock.

W. J. SUTHERLAND, Pres. Holmes M. Co., Candelaria, Nevada, is in San Francisco en route to Grizzly Flat, Cal.

E. S. BARNEY, managing owner Amador chlorination works, Drytown, Cal., has returned from San Francisco.

A. W. McCLEURE of Salt Lake City, Utah, is Pres. of the Utah & Pacific Ry. Co., which will build seventy-five miles of railroad, on

the U. P. grade of '88, from Milford, Utah, to the State line between Utah and Nevada.

J. TOURTELLOTTE, owner Tourtelotte mines, Minersville, Cal., has returned from San Francisco to Weaverville, Cal.

J. D. HURD has been appointed Pacific coast agent of the Colorado Exploration Co., with headquarters in San Francisco.

S. W. CHENEY, San Francisco, is visiting the Mammoth-Garfield mine, of which he is Gen. Mgr., at Whitehouse, Cal.

H. W. FAIRBANKS of the University of California at Berkeley, is examining mining properties in Calaveras county, Cal.

H. MCCORMICK, who has been directing work at the Lucky Boy mine at Custer, Idaho, has returned to Salt Lake City, Utah.

R. G. BROWN, Mgr. Bodie Con. M. Co., Bodie, Cal., has returned from La Huerta, L. C., where he examined mining properties.

D. B. LYMAN has resigned the superintendency of the Con. Cal. & Va., Ophir, Mexican, Union Con. and Utah Con., Comstock, mines.

M. FLYNN, who has resigned as Supt. of the Sacramento mine at Mercur, Utah, to accept a position in West Australia, is succeeded by A. Benner.

A. CAMINETTI, the mining attorney, Jackson, Cal., has returned from San Francisco, after placing his son in the military academy at San Mateo.

FRED J. HELLMAN, a former Comstock civil engineer, is reported to have been appointed Mgr. of a South African mining property at a salary of \$30,000 in gold a year.

TIREY L. FORD, prominent in the councils of the California State Miners' Association, was nominated by acclamation at the Republican convention on the 24th inst. for Attorney-General.

G. H. ROBINSON, Salt Lake City, Utah, has returned from an extended sojourn at Butte, Mont., and is giving his attention to the Sioux-Ajax tunnel at Mammoth, of which he is Gen. Mgr.

J. H. NEFF, the honored president of the California State Miners' Association, was on the 24th, at Sacramento, Cal., unanimously nominated by the Republican State Convention for Lieutenant-Governor of California, amid great enthusiasm.

JOHN B. FARISE, consulting engineer of the Exploration Co., Ltd., is investigating a mining region in southwestern Siberia, in the heart of Kibiriz Tartary, with headquarters at Karkaralinsk. He has examined several properties in Roumania and Transylvania, and will return from Siberia Nov. 1.

THE ROSSLAND, B. C., *Miner*, in noting the recent sale of the Center Star mine for \$2,000,000, mentions the report made thereon by R. A. Parker, on which the sale was largely based. Capt. Parker is now practicing his profession as engineer in San Francisco. His office is Room 225, Crocker Bldg.

BERTRAM HUNT, the local agent of the Gold & Silver Ex. Co. of America, has a cable from the MacArthur-Forrest people calling him to London, whence he goes to assume charge of some of the company's interests in West Australia. Mr. Hunt leaves this week. His successor has not yet been designated.

JOHN BECK has resigned as Pres. of the Bullion-Beck M. Co. at Eureka, Utah. He is succeeded by J. A. Cunningham. The Silver City Star says that this action probably marks the complete severance of John Beck from a mine he located twenty years ago, and which raised him from a poor prospector to wealth and importance.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

CURTAIN HANGER.—H. F. Bogel, San Francisco, Cal. No. 609,179. Dated Aug. 16, 1898. This invention consists essentially of rings or loops which are adapted to slide upon the curtain pole, and in conjunction with these are automatically closing gripping devices adapted to seize and hold the upper end of the curtain and connect it with the hangers. These bands are loops of metal the normal tendency of which is to straighten out or expand, and the band has at one end a jaw. The second jaw is pivoted with relation to the first named jaw, having a portion extending above its pivotal connection, and a connection between the extended end of the second jaw and the free end of the band, so that the band and jaw may be detachably engaged and the band made to surround a curtain pole. The device is thus easily engaged or disengaged at will.

SPRAYING APPARATUS.—G. A. and R. F. Dunn, Dinuba, Cal., assignors of one-third interest to W. A. Conn of Fresno, Cal. No. 609,183. Dated Aug. 16, 1898. This invention relates to an apparatus which is designed for the purpose of spraying trees and plants with mixtures or solutions intended to destroy insects and vermin and to otherwise improve the condition of the trees or plants thus sprayed. The invention consists essentially in the novel construction of the tank or vessel containing the solution, a means for strengthening and cheapening the construction thereof, and of an air-forcing pump with means for reversing the flow of the air into the tank, means for straining the liquid before it is discharged and for cleaning the strainer if it becomes clogged. The containing vessel is made in the form of a cylindrical tank or barrel, with exterior hoops and plates at each end. Transversely of the pieces forming the heads. These plates are united by rods extending from end to end exterior of the tank and connecting with bars which rest upon the strengthening pieces, so that when the nuts

are turned down upon the rods these parts are clamped together with any desired degree of tension and pressure and will thus prevent the dislodging of the heads. Inlet and outlet passages are connected with the tank and with suitable joints to prevent leakage, one having perforations for the admission of air and the other a passage by which the liquid is discharged without coming into contact with the pump. A suitable strainer is fixed in the outlet pipe exterior to the tank, and the discharge pipe connects with the pipe above the strainer. The valve chamber is so situated and connected with these pipes that air may be discharged without the corrosive liquid coming in contact with the valves.

DRAFT REGULATOR FOR PLOWS.—C. G. Hampton, Ryde, Cal. No. 609,187. Dated Aug. 16, 1898. This invention relates to a device for regulating the draft of plows so as to throw it from one side to the other. It consists essentially of a draft bar having the rear end flexibly connected with the plow frame, the front end adapted to receive the draft connection, a second bar having the front end connected with the draft bar and diverging rearwardly therefrom, and a connection by which the rear end of the second bar may be moved backward or forward upon the line of the frame, so that the draft bar is moved from one side to the other. A fulcrum lever serves by its connection with these bars to move them as may be desired.

DUMPING VEHICLE.—W. A. Cowley, Benicia, Cal., assignor to Baker & Hamilton of San Francisco, Cal. No. 609,182. Dated Aug. 16, 1898. This invention relates to improvements in dumping carts or wagons having bodies turning upon pivot or fulcrum points, which are fixed with relation thereto so that the body may be turned and dumped. This invention is designed to enable the body to be turned so as to dump the load without contact with the axle or other parts. The body is preferably made of sheet steel and has a circular segmental periphery and trunnions upon the sides, which are axial with relation to this periphery. A crank axle extends across beneath the body and above the vertical line of its support, the crank portion having arms upon which the bearing wheels of the vehicle are journaled and turnable, and extensions above said arms to which the bearing trunnions of the body are connected out of the vertical line of the bearing wheel journals, so that the body is suspended approximately above the wheel bearings and is turnable about its trunnions, to discharge the contents completely without their falling upon the crank portion of the axle. Winding drums and gearing are fixed at the front of the vehicle, and chains or wire ropes coil upon these drums and connect with the dumping body upon opposite ends of its curved face, so that by turning in one direction the body will be tilted to discharge its load, and by turning it in the other direction it will be returned to its upright position.

ACETYLENE GAS GENERATOR.—John Kirkham, Oakland, Cal. No. 609,189. Dated Aug. 16, 1898. This invention relates to apparatus which is designed for the generation of acetylene gas. It consists of a cylindrical generating chamber having an interior carrier so constructed as to contain a plurality of carbide containing cylinders, said carrier being rotatable, so as to present the carbide containers successively to the action of water, which is so introduced to the apparatus that it may be delivered into the contents of the carbide cylinders as they are presented at the point of water supply. The carbide chambers are perforated cylinders, which are slidably fitted into the holders, and the outer case has openings with closing doors or plates, so that when these closing plates are removed any one or more of the cylinders can be withdrawn or returned to its place in the carrier. The water supply for the apparatus is introduced through a pipe which extends into the end of the case above the uppermost of the cylinders, so that either one may be brought into line beneath it to allow the water to percolate through the contained carbide and produce gas until this cylinder is exhausted, when another is brought into line, and so on.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey, Strong & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR THE WEEK ENDING AUGUST 16, 1898.

609,170.—CURTAIN HANGER.—H. F. Bogel, S. F.
609,003.—PROJECTILE.—P. Borelli, Wapinitia, Or.
609,182.—DUMPING VEHICLE.—W. A. Cowley, Benicia, Cal.
609,332.—GYROSCOPIC TOY.—Donaldson, Owen & Williams, Garvanza, Cal.
609,183.—SPRAYING APPARATUS.—G. A. and R. F. Dunn, Dinuba, Cal.
609,095.—CAR BUFFER.—Gilman & Brown, Tacoma, Wash.
609,187.—PLOW DRAFT REGULATOR.—C. G. Hampton, Ryde, Cal.
609,350.—DREDGER.—T. R. Jones, Sacramento, Cal.
609,189.—GAS GENERATOR.—J. Kirkham, Oakland, Cal.
609,381.—FIRE ESCAPE.—Leach & Turner, Truckee, Cal.
609,283.—COUPLING.—W. N. Long, Salem, Or.
609,118.—SKIRT PROTECTOR.—C. E. Nye, Walla Walla, Wash.
609,049.—ROTARY ENGINE.—S. S. Rose, Amador, Cal.
609,174.—BICYCLE SUPPORT.—G. S. Thurston, Santa Rosa, Cal.
609,378.—WINDMILL.—J. A. Weitzel, Redlands, Cal.
609,175.—GUM MOISTENER.—W. L. West, Portland, Or.
609,384.—CUE TIP.—Young & Bundy, Santa Ana, Cal.

NOTE.—Plain and Certified Copies of U. S. and Foreign patents obtained by Dewey, Strong & Co., by mail or telegraphic order. American and Foreign patents secured, and general patent business transacted with perfect security, at reasonable rates, and in the shortest possible time.

Life of an Electrical Engineer in the United States Navy.*

To enter the service as an electrician the candidate must first pass an examination by the electrical boards of the naval recruiting station at which he makes application. The examination aims to secure only those men who have a good working knowledge of the business. If successful, the candidate goes to the receiving ship, takes his physical examination and is "sworn in." He is furnished with his clothing outfit, and at this point makes the discovery that there is no gold lace whatever on any garment, and that the equipment yeoman has forgotten to put his sword in. The electrician's pay is very small, and he ranks only as petty officer. If he has never been to sea, his rate is second class.

Until assigned to some vessel, he is kept on duty in the navy yard, in the dynamo-room or in the repair shops. The first few days I was in Brooklyn, the captain of the Vermont, to which I was first sent, did not discover that he had me with him, and, as a consequence, I was sent with a working party on my second day to help load the Sterling. As I thoughtfully marched back to the Vermont that night, I made up my mind to find out on the morrow what that examination was for; but it was not necessary, for all the new electricians were sent to the dynamo room next morning, where we were given something definite to do. On my fifth day I was assigned to the New Orleans.

On most ships of war the electricians stand their regular four-hour watches in the dynamo rooms. We do not. The steam engineering department has charge, and it is our care to look after the circuits, the instruments, and make such repairs as are necessary. A complete test of the whole plant must be made each "quarter," and we have just finished our first one. The current is furnished by three 32-kilowatt generators direct connected to Armstrong compound generators. Their capacity is 400 amperes each. When it is considered that there are motor and searchlight circuits, and that the whole system needs constant attention, it may be seen that much work is necessary to keep the system in working order. The main battery, consisting of the guns, is provided with electric firing devices and miniature incandescent lamps for night sights. This power is furnished by batteries, and, beyond testing twice each day, they do not require much attention. A correct and complete log must be kept daily. This includes the reading each hour of the steam pressure, engine speed, voltage and current on the generators, with any remarks as to the general working of the system during each twenty-four hours. All materials expended from the electrical storeroom must be carefully accounted for. When at sea in the enemy's country a man must sleep on each fighting top for possible operation of the searchlights—of which we carry four. Our work is, of course, harder some days than others. Every one knows that trouble never comes singly, and accidents on board ship, as elsewhere, go in streaks.

When "general quarters" sounds we are transformed. General quarters is the signal to clear for action. Our first duty is to place spare batteries on all the guns, cut off all circuits not necessary for the navigation of the vessel, and take down all fixtures and globes liable to be injured by concussion from the guns. When that is done we become part of the "bo's'n's" fire brigade, and are stationed aft, where we may see all the battle, and possibly get our heads knocked off by falling rigging or an exploding shell. All men on the spar deck are in like danger—but the safest spot in time of action is where you are. Altogether, an electrician's position is far from being a snap. There is much disagreeable work and it seems to a new man that the officers have unpleasant ways of saying things.

*Peter Wintermuth, U. S. N., in Leslie's Weekly.

Restoring Burnt Steel.

The so-called regeneration of burnt steel is most simply accomplished in the following manner:

Heat the steel several times to a dark red and quench after each heating in hot water. The steel finally recovers its former qualities. The first heating and quenching has the strongest effect, which gradually becomes weaker until after the fourth or fifth treatment the steel is affected no longer. From this it is evident that three or four temperings are usually sufficient. By examining the fracture surface of steel thus regenerated, it will be found that its grain has become as fine as it was before burning. In fact, its structure is identical with that of similar steel hardened, but which has not suffered any previous burning. It is, however, always to be understood that the above-mentioned chemical change of the steel in regard to its carbon contents has not taken place simultaneously with its burning. In this case this simple tempering method is of no avail, and the steel has to be subjected to a different treatment, according to the circumstances. If the steel has absorbed too much carbon, it should be heated slowly, allowing free access of air. If it has lost too much carbon, it has to be recarbonized before hardening. This is accomplished by putting the tools or other steel articles to be treated into boxes of sheet iron or crucibles and imbedding them either singly or collectively in powdered bone or charcoal. After the boxes or crucibles have been closed tightly, these, together with the contents, are heated for about one hour, when the articles are taken out and tempered in water. Frequently heating in closed vessels is dispensed with, and simple hardening means applied to the articles. In this case, for instance, ferro-cyanide of potash can be sprinkled on the articles after they have been heated to a brown red, and they are then tempered in water.

A number of means for regenerating burnt steel are in use, and either one or the other is recommended by their respective champions; some favor pure water, but others prefer stronger mixtures, of which we give a few receipts:

1. Ten parts of resin, five parts of fish oil, three parts of mutton fat. When employing this mixture the steel is heated to a dark red and quenched in the molten liquid, after which it can be tempered in the usual manner.

2. Ten parts of mutton fat, ten parts of linseed oil, one part of lampblack. This mixture is melted and the heated steel is dipped into it for one minute.—Werkmeister Zeitung.

A Water Spyglass.

A. McL. Hawkes, chief engineer of the Chilkoot Railroad & Transport Co., having to examine the bottom of a muddy stream, has devised what he calls a water spyglass. A wide-mouthed bottle, a cork, a candle and a piece of 3-inch gaspipe comprised the outfit necessary, and the only other accessories used were a jack knife with a corkscrew in it, an old tinpail and a clean pocket handkerchief. These were employed as follows: A pailful of the muddy water was first drawn and set aside; a hole was then made in the cork of a vaseline bottle with the corkscrew, and reamed out with the knife blade, and the cork was then forced on the end of the 2-inch pipe, which had been heated in the camp fire so that the hole was burned to exact size. The cork was next forced into the bottle, with the top of the cork slightly below the glass, and the hot grease from the lighted candle was allowed to run into this space, and a large mass of the grease was run about the rod and the neck of the bottle. A funnel was now made, out of the leaf of a fieldbook, and lined with the handkerchief, and enough water was decanted from the pail—which meanwhile had been acting as a settling basin—to fill the bottle and about 1 foot of the pipe; as this pipe was lowered into the water more water was

poured in to equalize the pressure. This outlet formed the spyglass, and objects were to be observed through it. Without the spyglass white objects, 6 inches square, could barely be seen through the muddy water at 1 foot depth; with it stones of any size and color could be seen 3 feet below the surface, and small stones 6 feet below. The only distinguishing colors, however, were black and white. Shining objects, such as brass and polished steel, could be very plainly observed. With another spyglass, made on similar lines, but filled with clear spring water, it was easy to see 16 feet into water which, without the glass, the white page of a fieldbook could only be dimly seen at a depth of 5 to 6 feet.

Cost of Rare Metals.

The following shows the cost of rare metals per pound, avoirdupois:

| | |
|---|-------------|
| 1. Gallium..... | \$68,600 00 |
| 2. Vanadium..... | 10,780 00 |
| 3. Rubidium..... | 9,800 00 |
| 4. Thorium..... | 8,330 00 |
| 5. Glucinium..... | 5,800 00 |
| 6. Calcium..... | 4,900 00 |
| 7. Lanthanum..... | 4,900 00 |
| 8. Lithium..... | 4,400 00 |
| 9. Indium..... | 4,400 00 |
| 10. Tantalum..... | 4,400 00 |
| 11. Yttrium..... | 4,400 00 |
| 12. Didymium..... | 4,400 00 |
| 13. Strontium..... | 4,300 00 |
| 14. Arium..... | 3,675 00 |
| 15. Erbium..... | 3,675 00 |
| 16. Ruthenium..... | 2,695 00 |
| 17. Niobium..... | 2,450 00 |
| 18. Rhodium..... | 2,450 00 |
| 19. Barium..... | 1,960 00 |
| 20. Titanium..... | 1,102 00 |
| 21. Zirconium..... | 1,040 00 |
| 22. Osmium..... | 1,040 00 |
| 23. Uranium..... | 980 00 |
| 24. Palladium..... | 580 00 |
| 25. Tellurium..... | 450 00 |
| 26. Chromium..... | 400 00 |
| 27. Gold..... | 300 00 |
| 28. Molybdenum..... | 245 00 |
| 29. Platinum..... | 144 00 |
| 30. Thallium..... | 122 50 |
| 31. Iridium..... | 112 00 |
| 32. Tungsten..... | 36 00 |
| 33. Potassium..... | 28 00 |
| 34. Selenium..... | 18 80 |
| 35. Cobalt..... | 6 00 |
| 36. Magnesium..... | 4 50 |
| 37. Bismuth..... | 2 75 |
| 38. Sodium..... | 2 50 |
| 39. Aluminum..... | 2 00 |
| 40. Manganese..... | 1 10 |
| 41. Cadmium..... | 1 00 |
| 42. Arsenic..... | 40 00 |
| Manganese, chemically pure, per lb..... | 160 00 |

A NEW KIND OF CARBON for arc lamps is reported to have been patented in Russia. It is made from 90 per cent of very pure carbon and 10 per cent of carburet of silicium, the ingredients being very finely pulverized and agglomerated with pitch. The carburet of silicium contains no volatile element and resists oxidation more than other substances, the carbon being necessary to make it a conductor. It is claimed that the duration of these carbons is 360 hours and that they not only save 25 per cent in current, but yield a richer tinted and stronger light than that of ordinary arc lamps.

THE rapid rise of the land about Hudson bay is said to be the most remarkable gradual upheaval of an extensive region ever known. Driftwood covered beaches are now 20 to 60 or 70 feet above the water, new islands have appeared, and many channels and all the old harbors have become too shallow for ships. At the present rate the shallow bay will disappear in a few centuries, adding a vast area of dry land or salt marsh to British territory in America.

THE Geddes & Seerie Stone Company of Colorado has filed a \$12,000 damage suit against the Pioneer Electric Power Company and the Union Light and Power Company in the United States Circuit Court. The damages are alleged to have been sustained through the failure of the company to perform its part of a contract entered into between the parties for the construction of a wall across Ogden canyon, Utah.

HUMAN talk can now be had over a telephone at a distance of 1800 miles, and conversations a distance of 1500 miles are common. There are now nearly 1,000,000 telephones connected with this country's service, employing a capitalization of about \$100,000,000. Every day about 17,000 employees make on an average more than 3,000,000 telephone connections.

Advertising a Bid for Publicity.

A party who has been continuously advertising more than thirty years said to me recently: "I advertise to be known—to keep known. I employ salesmen to sell my goods. I do not want my representative to enter a factory in California or Illinois and on presenting his card be met with the query: 'I never heard of your house; how long have you been in business?' We recognize that publicity is capital, and we spend thousands of dollars to keep our house before the public, and our salesmen have a great advantage over rivals who do not see the value of publicity."—Carriage Monthly.

PROF. SHALER does not believe that the ice age in America was caused by much more intense cold than is now known on this continent, but rather by an enormously increased fall of snow in the boreal regions of America, such as would follow an enlarged evaporation from adjacent seas. The glaciers of Greenland and northern Scandinavia are attributed in great measure to the Gulf Stream. If, then, the region about Behring strait should sink down enough to admit a large part of the Kuro Siwo or Japanese current into the Arctic sea, it is possible that the conditions would be furnished that would be necessary for the formation of our great ice sheet. Evidence is found around Mt. St. Elias that the adjacent shores of Alaska were once 4000 feet lower than they are now, a fact that lends color to a theory of this sort.

THE greatest known depths of the sea are in the South Atlantic ocean, midway between the Island of Tristan d'Acunha and the mouth of the Rio de la Plata. The bottom was there reached at a depth of 40,236 feet or seven and three-fifths miles. In the North Atlantic ocean, south of Newfoundland, soundings have been made to a depth of 4580 fathoms or 27,480 feet, while depths equaling 34,000 feet or six and a half miles are reported south of the Bermuda islands. The average depth of the Pacific ocean, between Japan and California, is a little over 2000 fathoms; between Chili and the Sandwich islands, 2500 fathoms, and between Chili and New Zealand, 1500 fathoms. The average depths of all the oceans is from 2000 to 2500 fathoms.

A CATALOGUE is the representative publication of a house—a sort of salesman. It is supposed to list and fully describe the kinds of merchandise for sale by the house. As to its use, the catalogue usually presupposes an interest in the goods it describes either among consumers who have asked for it or among dealers. Its mission is, therefore, to satisfy an existing demand rather than to create one. As a salesman, the catalogue should show samples, where possible, by means of illustrations, which portray the articles of merchandise, etc., in as realistic a manner as their nature permits. The description which is given of each article should be complete enough to satisfy the curiosity at least of the reader and to give him a thorough understanding of its points of usefulness.

AN employe of one of the underground trolley roads in this city apparently received a discharge of 2000 volts through his arms a few days ago and was not killed. He entered the conduit through a manhole in order to remedy some defect; but, while climbing out after completing his task, accidentally placed both hands on the channel rail. He was instantly rendered unconscious and was picked up apparently dead, but soon revived and had only some severe burns on the hands to remind him of his carelessness. The full strength of the current was 2000 volts.—N. Y. Medical Record, Aug. 13th.

THE first telephone was constructed in 1877, between Boston and Somerville, Mass., a distance of three miles.

Mining Summary.

CALIFORNIA.

Amador.

Pres. Pearce of the Blue Lakes Co., after a trip to the lakes and having made a survey of the water, stated at Jackson that the company has enough water to supply patrons with one-half the amount they have been using to operate their property, until Jan. 1, 1899. The prospecting work on the Spagnoli at Clinton continues systematically. The level at the 100-foot station is in 40 feet on a vein from 24 to 36 inches thick, which assays from \$50 to \$75 per ton and contains 3 percent sulphurets.

Record: At the Lincoln mine, Sutter Creek, work is progressing satisfactorily. The shaft has been sunk and timbered 218 feet; good progress is made in sinking; in two weeks 50 feet has been sunk and timbered. Some good quartz has been found. The 10-stamp mill at the Pocahontas mine, Drytown, is nearing completion. They have struck the same ore on the lower level that they had in the upper crosscuts. The Wildman and Mahoney mills are hung up because the Blue Lakes Water Co. fail to furnish the usual water supply.

Republican: The Kennedy M. & M. Co., Jackson, bought the Massa ranch, \$3000 cash and \$7000 later on. It is said that this purchase includes the Jackson Gate mine. The Keystone mine and mill at Amador City are idle, and it is probable that work will not be resumed for some time for scarcity of water. The water in the old Morgan shaft is being drained by the tunnel the Butte Basin M. Co. is running. The South Eureka is working as usual and shows no signs of idleness.

Butte.

In the Golden Gate mine, near Lovelock, twelve men are at work. A tunnel is in 3500 feet and gravel has been reached.

Oroville Register: Nine teams came out from Biggs last week with lumber and other material for two new dredgers that are to be built on Feather river. Six men came out to work on one and seven on the other.

Oroville Mercury: At Yankee Hill the Clark claim is running on good pay ground. It is locally reported that the Buchanan Hill mine is to start work soon. J. McConnell has struck an old river channel which prospects well. It is 300 feet above the present river bed. The Scott & Stone claim at Murphy Hill will begin work shortly. The mining enterprise for the development of the North Fork of Feather river is in a very promising condition. It was thought at first impossible to transport the necessary machinery to make the work successful. In fact, because of this, the North Fork has never been worked except under the benches and bars, and the bed of the river is known to be virgin ground. All along the sides of the North Fork miners for years have earned wages by use of the old-time methods, and the many tributaries have been worked with good success since the early days of mining. However, all the machinery necessary for the work is on the ground, having been taken over gulches, difficult to even climb. The company controls eight miles of the river bed.

Calaveras.

(Special Correspondence).—The Fellowcraft and San Andreas mines near San Andreas were sold yesterday by A. N. Lewis and J. W. Provand of San Francisco to J. M. Lively, representing southern Ohio capitalists for \$100,000. The Fellowcraft has a 250-foot shaft, several crosscuts and a 10-stamp mill. The property has been idle some time. Work will begin Sept. 1, by unwatering the shaft. San Andreas, Aug. 25th, '98.

C. J. Decker has bought the Keystone and Bonanza King mines in Railroad Flat district for \$30,000, the payments to be made at the rate of 25 percent of the gross proceeds. A shaft will be sunk 500 feet before any levels are run or stopping done.

Lumber is distributed along the line of the flume being built by the Utica Co. from Downs Landing. The work of building has begun. The company estimates its expenditures on this work at about \$50,000.

At San Andreas, C. J. Decker bought the Keystone and Bonanza King mines for \$30,000. The Keystone has a 9-stamp mill. M. Emery of the Rose Hill mine has bought the half interest in the Pillsbury reservoir and the Italian reservoir, near El Dorado, together with all water rights, and will place them in good condition to furnish power at the Rose Hill.

Chronicle: The Mokelumne & Campo Seco Canal Co., will build a large storage reservoir up in the mountains. In a few weeks fifty men will be set at work. The stream the company intends to dam is the Little Mokelumne. The proposed work will cost in the neighborhood of \$10,000 and when completed will obviate all shortage of water in this section in the future. While crosscutting at the 700 level in the Ford mine, near San Andreas, a 20-foot wide vein was found that is of fair grade.

Del Norte.

The Jones Creek M. Co. near Crescent City has suspended operations for the summer on account of failure of water. The claim is in good condition and a profitable run is expected next winter. At closing down a streak of gravel had been reached yielding coarse gold intermixed with quartz.

El Dorado.

Near Josephine, Shultz & Root are running a tunnel on a 3-foot wide ledge of fair grade ore. The Cash Rock M. Co. is working a large crew.

Democrat: Work on the new mill and electric power plant at the Griffith mine, Diamond Springs, is progressing. The electric power will be furnished by the plant projected by J. J. Crawford. E. W. Chapman has put costly machinery on the Gold Note mine,

Omo Ranch, and is giving employment to seventy men.

Inyo.

Montgomery Bros. at the Weaver mill at Ballerai cleaned up eighteen pounds of bullion, or \$4000, on ore from Tuber canyon.

The Independent says that a plant will be erected within ninety days at the borax marsh capable of manufacturing 100 tons of refined borax per month, and within six months borax will be placed on the market at the rate of 100 tons per month.

Independent: The new smelter of the Inyo D. Co. on the Sorbi-Lane mine, near Darwin, is a success. Twenty-five tons of ore are daily reduced.

Register: The first shipment of bullion from the Darwin smelter amounts to twenty tons. The smelter is running steadily.

Kern.

A cyanide plant is to be built at the Eureka mill, Randsburg, with three tanks of ten tons each. One and a quarter pounds of cyanide are used to a ton of tailings assaying from \$10 to \$20. Usually tailings require four or five days' submersion in the cyanide solution, but it has been found that sixty hours' submersion is sufficient for the ores of that district.

Los Angeles Review: In the Butte mine at Randsburg at the 280-foot level several men are stopping. The ledge is 4 feet wide and the ore runs from \$200 to \$400 per ton. At this level 100 feet of stopping ground has been blocked out. A 2-foot ledge of good ore was uncovered at the 321-foot level. In the 378-foot level a ledge of hard, bluish-colored rock was uncovered, carrying both free gold and sulphurets. At the 480-foot level this same rock was found and it appears again in the main shaft at a depth of 500 feet, the vein being 7 feet wide. At a test run of four tons from the 480-foot level the result was \$18 per ton free gold, \$2 per ton tailings and \$104 per ton sulphurets.

Randsburg Miner: The Red Dog mill at Johannesburg has been running entirely on Butte ore the past week. Work on the Windy mine is active. Ten men are employed and two shafts being sunk on different ledges. More prospecting is going on about this section just now than at any time during the past year, and several very promising claims have been located which give evidence of good results. At Randsburg only high-grade ore is being hauled to the mills controlled by the Yellow Aster people. All the low-grade ore is saved until the company's mill is in operation. A strike has been made in the Buckboard mine, beyond the Stringer district, of ore 2 feet in width at 90 feet depth of high grade. The Wedge mine will soon begin sinking the shaft to 1000 feet depth. The company is taking out good ore.

Los Angeles.

W. A. Perry, who has a bond on the Ojer mine, in the Holcomb valley district, is developing the property. There are several custom mills operating in that section.

Mariposa.

(Special Correspondence).—Dillon & Co. have the Porter mine on the west belt under lease and bond. A 2-stamp prospecting mill has been placed on the property.

After a shut down of three weeks for the purpose of making necessary underground connections, the Louisiana mill has resumed work. The mine is reported looking unusually well just now.

Chicago parties have bonded the Murphy mine in White's gulch and are sinking a new shaft.

The Merced Co. is making extensive improvements at the Mary Harrison. New boiler and shaft houses are under way and the great hoisting engine formerly at the Louise will be placed here. The new galloways frame, 100 feet high, will contain grizzlies, crusher and ore bins; skips will replace the present cages and cars will load direct at the collar of the shaft. A 10-ton locomotive will take the place of mules on the tramway. The mill is expected to start about Sept. 1st, the water on hand being thought sufficient to last till the rains. The mine is in shape for a long run and large amounts of wood are being delivered. If the present mill run starts satisfactorily that \$3 assessment will be called at last, and after repaying the money borrowed for the development of the past nine months further additions will be made to the plant.

The Compromise has been unwatered to the 300 level and found in good condition, with considerable milling ore in the faces. The mill is running steadily on ores from near the surface.

The prospecting work in the McAlpine has uncovered good ore once more and operations are suspended while arranging for money to work on a larger scale.

The Contention is closed indefinitely, and nothing is being done on the Garibaldi, near by.

J. S. Jayquith succeeds J. Gowie as Supt. Big Betsy. About thirty men are employed on development work and the company has bonded a number of adjacent claims.

Owing to dissensions among the owners the Selleck mine and mill have been sold by the sheriff. Mr. Selleck repurchased the property.

An unusual amount of work is in progress throughout the whole Sherlock district.

Bear Valley, Cal., Aug. 23d, '98.

Gazette: Mrs. Merck is taking ore from her mine that yields \$20 a ton. She has been in the mining business for thirty years. J. D. Ludwig is sending ore to the Yellowstone mill at Bear Valley.

Nevada.

Transcript: This week water was turned into the Electric Power Co.'s new pipe line leading from Rock creek, for the first time. This line gives a 700-foot pressure for the works on the South Yuba, and will effect a saving of two-thirds over the old line in the amount of water required to run the machinery.

Transcript: At the Delaware drift mine

near Nevada City, which has paid large profits for a long time, the machinery has been taken down. Recently a ledge of favorable looking quartz was struck, but proved of no value. The channel within the boundaries of the claim has been worked out. A force is cleaning and retimbering the Midnight mine.

Placer.

The statement of the Pioneer Mining Co. for twenty-six days in July shows: Tons rock crushed, 3902; value gold bars, \$4768; payroll, \$9222; bills, \$695; total expenses, \$3917; net earnings, \$850; average value rock, \$13.17; men employed, 44. The water supply diminished steadily during the month, but it has been a favorable time for constructing the dam, which is about completed. When finished and the new electric plant installed, there will be sufficient power for all purposes.

The shaft in the Marguerite mine near Auburn has reached 400 feet. The company will continue sinking for three months and then begin running drifts.

Plumas.

The Four Hills quartz mine, near Johnsville, has a 4-foot ledge of good milling ore. The company proposes to build a mill on the property early next spring. The property is owned by San Francisco people. The Cameron mine, in Butt valley, has driven 1150 feet of tunnel. The body of gravel is 80 feet wide and is said to pay \$10 a day to the man. Five men are employed. The Dunn Bros. have considerable ore on the dump and are crushing from three to five tons a day.

San Diego.

The San Diego court has rendered judgment in favor of the plaintiff for \$341.85 in the case of Paul J. Johnson vs. the Senator M. Co. et al.: The Buena Vista, General Hart and Susan Dutton gold quartz mining claims, together with a 20-stamp mill, buildings, improvements and appurtenances, which are ordered to be sold to satisfy the judgment.

Sierra.

The Arctic Co. at Sierra valley are running an incline into the channel and will thoroughly prospect it.

Shasta.

At Copper City exploration on the Bully Hill properties continues successfully. The depth reached through tunnel workings is 400 feet. The ledge varies from 5 to 8 feet and is sulphide ore. Sixty tons a month are shipped to Selby's at a cost of \$20 a ton from the mine to the smelter. Hugh McDonnell and J. Sallee are developing the property. The Menzel & Pugh claims near Shasta have a tunnel 150 feet. The ore vein is from 3 to 22 inches wide and carries gold, but the greater values are in the sulphurets. Supt. Kemp of the Boston-Montana Co. on Stillwater, has received instructions to increase the force on development work, which is at present being pushed on various portions of the property.

The mills about French Gulch are unable to run, as there is not enough water for the batteries. J. Cannon, leasing at the Washington mine, has struck a 1-foot ledge of good ore and is shipping to the smelter at Vallejo. Development work at the Niagara mine continues with satisfactory results.

The Mt. Shasta mine, near Shasta, is shipping ten tons of ore a day that smelts \$40 a ton. Twenty men are employed. The shaft is 120 feet deep and several hundred feet of levels have been run, all in ore. The Van Ness mine, near Bragdon, is producing good results in the systematic development work being done. The Iron Mountain Investment Co. has bought the Westbourne and the Arlington quartz properties in Flat Creek mining district.

Courier: The 10-stamp mill at the Spanish mine, near Shasta, makes only short runs at present on account of the limited water supply. The case of the Government vs. Mt. Copper Co. will be heard by Judge Morrow on October 10th.

Siskiyou.

(Special Correspondence).—The Schroeder Con. mine, seven miles from Redding, it is currently stated, will soon have a new mill to replace the one destroyed by fire about a year ago. The property comprises five patented claims and has been a good producer. Since the burning of the mill work has not been neglected in the mine. There are over 4000 feet of tunnels, in all of which the vein averages 5 feet in width. At 1200 feet depth one tunnel cuts an ore body 100 feet wide, in which 4 feet have produced \$132 a ton. The formation is porphyry. J. H. C. Schroeder of Yreka is the owner.

Yreka, Aug. 22nd, '98.

The company prospecting the Yreka creek basin, near Yreka, has forty-eight more prospect holes to sink to bedrock in testing the ground at McNulty's place, upon which an option has been secured. Probably in another month or so the company will complete the entire prospecting from Hawkinsville to the Yreka boundary, when definite knowledge will be secured as to what may be obtained from the stretch of country tested, extending over an area of two miles in length and between high bedrock on both sides of the creek bottom. A. Smith, of the Pacific mine at the mouth of Humbug creek, Klamath river, has succeeded in getting the claim unwatered again. The bottoming is to be widened to a greater area. The bedrock gravel in this claim prospected well where tested, and if the men can hoist gravel without interruption a good amount of gold will be realized this season.

Near Cecilville S. A. Cunzetti has six men employed and is taking out considerable gold. The Deep Bank M. Co. had only a three month's run on account of the short water season. The returns were satisfactory. The final payment on the Thompson placer claim was made on the 6th. Steele & Maiben have done much development work on the property since buying and intend to put in giant and pipe next season. The Sumer-

ville Hydraulic M. Co. paid a good dividend this year.

Trinity.

C. Jensen is developing a 15-inch vein near Junction City. The La Grange Hydraulic Co. near Weaverville have sufficient water to run five hours a day.

The Chloride-Bailey mine on Canyon creek has fifty-six men in the mine and thirty men building a road from Dedrick to the mine. A. J. Helson is taking good ore from the Ridgeway mine near New River. On the White Elephant mine development work is being pushed. A ledge of fair grade ore has been found.

Tuoimne.

At Big Oak Flat, M. Cleveland is having rock tested at the Butler mill. Sheban Bros. are doing prospect work on their ranch. The Butler is putting up a new hoist.

The mill at the Moody mine will be in operation soon. At the Mountain Lily mine, Columbia, six men are at work. The Over mine is putting up a gasoline hoist and will push sinking. At the Little Mint mine work has been resumed.

From Sonora it is reported that J. M. Meighan has returned from Boston, where he formed a company for the operation of the Mt. Jefferson mine at Groveland. The company has been incorporated under the laws of Maine, and much of the capital stock has been subscribed. Last winter about 400 tons was milled, averaging \$18 a ton. A new 60 H. P. hoist and a new 10-stamp mill will be in operation Jan. 1st, '99.

Democrat: The new mill on the Carlotta and Pennsylvania is dropping its stamps. Good rock is taken from the Hope. Resumption of work on the Agnes shows good results.

Sinking has been discontinued in the Rappahannock. Crosscutting from the 1100 level is in progress. W. E. Booker has bonded to Dean & Stevenson of San Francisco 309 acres of the Brunell ranch, near Sonora. The bond expires in ninety days and calls for the payment of \$5500 should the property be taken. The mine has some development. The vein shows from 3 1/2 to 4 feet of quartz, and at the surface milled \$6 per ton.

NEVADA.

The latest shipments of concentrates from the Dexter mine at Tuscarora show a value of \$330 in gold and sixteen ounces in silver. The bullion output of the mine averages about \$30,000 a month.

The Glasgow & Western M. Co. at Cherry Creek have let a contract for the building of a concentrator at Six Mile springs. The plant will have a capacity of 100 tons of crude ore daily; the ore will be from the Star mine, in which a body has been found yielding gold, silver and lead. The mill product will be sent to the smelter at Golconda, where a third furnace is being put in. The North Mountain mine at Cherry Creek, owned by John Dern & Co. of Salt Lake City, will soon make dividend-paying shipments.

At Virginia City, as soon as the second ore bin at the Justice mine is full, work will be suspended in the whim shaft and operations resumed through the Woodville shaft. The station on the 370 level has been repaired and a drift will be run to the Barclay shaft. The Washoe mill, the property of the Justice Co., will run on rock from the above mine. It is locally reported that the Logan & Hully mill at Como will start shortly.

OREGON.

(Special Correspondence).—Contracts have been let for building a wagon road from Glendale to the Gold Bug mine, recently purchased by Senator and Sam Jones; a 20-stamp mill will be erected on the property at once.

The Green Back mine, at Placer, has been purchased by W. J. Cartan and E. Smith of Denver, Colo.; a compressor and hoisting plant will be put on the property at once and extensive development work pushed rapidly. Leland, Aug. 21st, '98.

The Miller & Dysert placers near Grants Pass were sold last week to S. W. Ferguson and others of San Francisco, for \$15,000. The gentlemen buying this property have also secured bonds on adjoining properties. The new owners of the Sugar Pine mine have struck a good body of ore.

Epigram: Sloan & Haskell, the veteran Susanville placer miners, arrived in Baker City last week with about \$10,000—the result of their labors for '98. About \$4000 of this gold ranged in weight from \$1 to upwards of \$100; the remainder, or about \$6000, was in fine dust. The mines from which this gold came have recently been sold by Sloan & Haskell for \$8000, they retaining a small portion of their holdings for future working. Mr. Sloan has also sold to the Badger M. Co. his group of ten quartz claims, located near Susanville, for \$50,000. One of this group of mines, the Bull of the Woods, recently yielded 115 ounces of gold after a twenty-six days' run with an 8-stamp mill. A 4-foot vein of high-grade free-milling ore was found the first of the week in the Rachael mining property, near Baker City.

Democrat: Supt. Nelson of the Beaver G. M. Co. and of the Robbins mine has put a force at work on the Robbins mine near Baker City cleaning out crosscuts, drifts, etc., and relaying track preparatory to further working of the mine. This mine was shut down three years ago for want of capital. The mine was recently sold to people of Pittsburg, Pa.—The Capt. Jack ledge, 6 feet wide and assaying \$30 per ton, has been cut 150 feet below the surface in tunnel No. 2 by the Beaver G. M. Co.—The Baisley-Elkhorn mine is shipping bullion twice a month and sacking some high-grade ore.—The Collateral-Virtue mines from a partial cleanup obtained 104 1/2 ounces gold, over \$1800. The mill has been running only a few days and a full cleanup will not occur until later.

WASHINGTON.

Near Silverton the tunnel on the Hoodoo mine is being driven and the property is in

condition to be made productive so soon as the Everett & Monte Cristo railway is finished. —The tunnel on the Eclipse has reached 500 feet. —Development continues on the Bonanza, the White Rock, Eagle, and Big Bear. —The El Dorado M. Co. is doing extension work, which is in progress day and night. —M. Haber, the German mining expert, has made the first payment on the option secured last fall on a group of mining claims in the Troublesome mining district near Galena, for \$50,000. He expended \$30,000 in prospecting the property before closing the deal, and at present has forty men employed. —The Republic mill at Republic is running night and day on good ore.

BRITISH COLUMBIA.

Thirty inches of ore is showing in the Bosum shaft, Slocan, and galena is taken from the tunnel. On the Mollie Hughes the showings in all workings are improving. —A strike of 3 inches of galena was made last week on the Eclipse.

A carload of ore was shipped last week from the Giant mine near Rossland. The lead in the Giant runs diagonally across the claim, giving it a length of 1600 feet. The soil has been removed at intervals along its course exposing the vein to a width of 25 feet. Rock from any part of this is impregnated with arsenical iron and molybdenum, carrying good values in gold. Where the ore is taken for shipment shows no difference from any other part. A crosscut tunnel is in upwards of 300 feet to catch the ore chute at a depth of about 150 and sinking on the lead is also in progress. —The Thistle, Pansy and Anderson claims at Albion have been sold to parties from Salt Lake City for \$20,000. G. Kislinsky Supt., representing the company, has fourteen men at work on the Thistle. —The Canadian Pacific Exploration Co., operating the Porto Rico near Ymir, has sixty men at work in the underground development, and grading for the new stamp mill.

The Le Roi mine at Rossland has 140 men employed in development work. —Ore shipments from Rossland last week were 1215 tons; total for the year, 55,320 tons. —The Antoine in the Slocan is shipping 100 tons of ore this month. —The tunnel in the Payne mine near Sandon is 1400 feet long. This property has paid dividends amounting to \$300,000. —The American Boy mine is running a new tunnel to cut the vein at 1000 feet depth. —The Payne's ore shipments amount to 10,000 tons. —The Slocan Star has a daily capacity of 150 tons. It has paid in dividends about \$400,000.

The North Star Co., East Kootenay, has shipped nearly 3000 tons of ore the past three months. The company is doing assessment work on twenty-one claims. They will sink a shaft 300 feet on the North Star mine. —Hamilton Bros. are working the Bellview claim and have a tunnel in 130 feet, on 6 feet of galena with a high percentage of silver. —The Canadian Pacific Exploration Co., operating the Porto Rico near Ymir, has sixty men at work on development and grading for the new stamp mill.

The Last Chance, in the Slocan, is again shipping ore, and Engineer Riblet is surveying for an aerial tramway to the K. & S. railway. —The Athabasca Gold Mine, Ltd., expects to drop the stamps for the first time in the new 10-stamp mill being built on the property in Nelson division Sept. 1st.

The B. C. Mining Critic, noting that the ores at the Trail smelter produce 1000 pounds of lead to the ton, and the smelter, running at full capacity 300 days in the year, would output 22,500 tons of lead, questions that the Trail output will command the home market, and that the experiment will give rise to the discussion of the lead question from the standpoint of a national industry.

The Ymir Miner estimates the number of men employed in the eight or ten properties working in that camp at 250.

ALASKA.

The company operating the upper river boats on the Yukon will build a railroad from the foot of the lake to the portage—thirty miles.

The steamer Brunswick arrived at San Francisco on the 24th inst. from St. Michael, bringing twenty-five passengers from the mouth of the Yukon and about \$200,000 in gold from the Klondike. Most of the men have been in from two to six years. They report work slack, owing to the heavy royalty, as miners do less work in order to escape the odious tax, and many leave their claims, going to the American side, in the hope that the royalty will be modified, when they expect to return to British soil.

UTAH.

The output of the Ophir Con. mine at Ophir this month will reach 1000 tons of concentrates. —In the North Star at Tintic are two classes of ore. The one shows seventy-two ounces silver and \$27 in gold, while the other shows a valuation of twenty-five ounces silver, 45 per cent lead and over \$4 in gold. The new body was found in a winze off the 300-foot level, and is described as the strongest in the mine. —The cost of the new mill on the Silver King mine, at Park City, which will have a capacity of 150 tons a day, is estimated to be \$100,000. It will be equipped with electric power and modern methods for the economical milling of ores. The Silver King has paid dividends to the amount of \$1,649,500.

The Sioux-Ajax tunnel at Mammoth has reached 4000 feet. It will soon make connection with the properties of the Sioux Con. M. Co., when extensive prospecting is to be undertaken. —Another good ore body has been found in the Julia Dean mine at Bingham. It is in an old upraise, which was lifted by leasers last year and abandoned. Work was begun where they left off, and within 3 feet ore began to fall. In one day upwards of three tons of unsorted ore that averages

over 100 ounces silver and is well up in lead were housed. —The Dalton & Lark employs thirty-seven men, mostly in the 800 and 850 levels. In the latter there are 2 feet of ore carrying 20 per cent copper, 22 per cent lead and thirty-six ounces silver. The 10-stamp mill is turning out a carload of concentrates per day.

Near Richfield in the Nancy Hanks gravel mine Chaffin & Hoy cleaned up \$7000. —Work is practically suspended throughout the district in July and August owing to the hot weather, but operations will commence in a few weeks. —M. J. Ryan is pushing work on the California bar, and T. O'Keefe is sluicing on his Santa Rosa claim and doing well.

Last week's shipments from Tintic were sixty-seven cars of ore, twelve of concentrates and ten bars of bullion. —From Silver City was shipped forty-two carloads of ore. —Park City shipped 1,690,710 pounds of concentrates.

—The Bullion-Beck at Eureka, which has not been among the regular shippers for several months, began shipping last week, the smelter having contracted to take the entire output until Jan. 1st. —If the tests that are being made for the Winnamuck at Bingham prove satisfactory, a mill will be built on the property next season. —The Rustler mine at Alta is marketing ores that assay 60 per cent lead and ninety ounces silver per ton. A tunnel is in on this property 1200 feet and the ledge is 3 feet wide.

Tribune: Upon the site of the Old Crescent mill at Park City, recently wiped out by fire, J. H. McGregor of the Crescent M. Co. is engaged in the installation of a set of jigs that will put fifty tons of crude ore daily into concentrates. There are several thousand tons of ore on the dump awaiting treatment. —The plans and specifications for the Highland Boy smelter at Bingham have been approved by the company, and the breaking of ground for the big plant is to begin at once. The builders hope to have it in operation by Jan. 1st. —Since the closing of the new contract with the German smelter, the Bullion-Beck has sent fifty cars of ore, and the marketing of that allowed to accumulate during idle intervals will be carried on as rapidly as possible. The earnings of the company during the last fifteen days of the present month are expected to show it capable of producing as much ore as at any time in its career. —At Provo a mining sale took place this week under the sheriff's hammer of a number of the Ozokerite M. Co.'s claims. R. J. Kroupa brought action against the company recently for \$3600, for services performed as Mgr. He obtained, by default, judgment for the amount. The property is estimated to be worth \$40,000.

IDaho.

In the Zenith mine near Florence high grade ore has been found. The ore body is 3 feet in width.

At Idaho City a \$5000 payment was made on the Lucky Boy mine last week. The mine is bonded to Pittsburg men for \$20,000. A payment of \$2000 will be made each month.

At Wallace the Helena Frisco Co. is cutting a station on the 1600-foot level, in which a Riedler pump will be placed. —Work has begun on a tunnel in the Colwyn mine at Wallace, contracted to run 900 feet. —Last week a strike was made in the Black Bear of ore 8 feet wide assaying 65 per cent lead and thirty ounces silver. The Black Bear was worked extensively years ago and yielded good returns, but during the financial panic it was mortgaged and has since lain idle.

The mill at Custer is being operated by the Lucky Boy M. Co. with good results. Ore is being extracted from the Lucky Boy mine, hauled to the tramway and dropped to the mill, 3500 feet down the side of the mountain, with a descent of over 1300 feet. This wire rope tram has done duty seventeen years, with only three changes of rope. The mill is reducing thirty-five tons of ore per day. The tailings are piled up in the yard, and will be worked in future. Up to one year ago the tailings floated down the Salmon because they were thought worthless. When cold weather comes the mill will close for the winter.

J. Hutchinson, Mgr. Trade Dollar mine at Salmon City, after an investigation says of the Seven Devils country that the work that is going on there now will make that camp one of the best in the country in the next two years, or it will demonstrate that it is merely a surface cropping. The showing already made, however, is not such as to discourage those operating there.

Press: Near Wallace, in the Black Bear mine, last week ore was struck in the lower tunnel, 8 feet wide, 2 feet of which is almost pure galena, assaying 65 per cent lead and thirty ounces silver, and the remainder concentrating ore. The old tunnel was extended from the original direction over 900 feet when the ore body was struck. The depth from the upper workings is 330 feet, so an amount of ground will soon be opened up. Some years ago the mine yielded handsomely, but it was managed badly and the owners in the East became dissatisfied and the works were closed down. —The Republic mine, Lemhi county, produced \$63,000 worth of ore in July. The shipments to the smelter were 293 tons, averaging \$174 to the ton, making about \$50,900 and the product of the mill was \$12,000.

Statesman: The Comoro mine near Albion has a tunnel on the ledge 308 feet, and from this they have taken 250 tons of ore that assays on the dump from \$24 to \$25. One block of ore weighing 440 pounds assayed \$34 in gold, sixteen ounces in silver, 53 per cent lead and 1.4 per cent copper. Four shafts have been sunk and show the vein to run from 3 to 5 feet wide. One shipment from these shafts assayed \$47.25. —About eighteen carloads of ore have been shipped from Badger, Jennie and Melcher, all paying well. The first car from the Badger of seventeen tons returned \$1325, showing a gold value of \$57 per ton.

Weiser Signal: E. L. Ford of Colorado has bought eight-twelfths of the Placer Basin group of gold properties for \$21,333, paying

\$4000 down, the other payments to be made soon. The remaining four-twelfths which have not yet been bought are owned by J. Bourne of Portland and H. G. Siskron of San Francisco. It is locally reported that a complete mining and milling plant will be put up and the mine turned into a heavy producer.

Avantech: In the Flint mines near Silver City the mill has been shut down on account of shortage of water, but the work in the mine is being continued with twenty-five men. The drifts in the 400-foot level of the Rising Star are being pushed. Ore is being bagged for shipment.

MONTANA.

The New Departure Co. at Dillon, the Graeter Co. in Bowhead county, and the Graves Dredge Co., are all operating dredges successfully. The latter company's plant is run by electricity. The Bon Accord Co., an English corporation, has completed its dredge and begun work. The M. A. Gibson, built a year ago, is still in successful operation. A New Jersey company is building a dredge, and will build two more next season. Coal is used for fuel in preference to wood.

T. G. Merrill at Clancy is sinking from the 400 level in the Liverpool mine to 600 feet depth. The ore in this property runs from 400 to 1550 ounces silver per ton. Since 1892 this mine has produced \$500,000.

At Clancy Bailey & Leary have taken a bond on the King Solomon mine for twenty-one months from Aug. 2 for \$20,000, and the royalty, 15 per cent, to apply on bond. The King Solomon is a silver property, carload lots having in the past been shipped from it netting more than \$3000 at the present price of silver. —The Magpie and Blaine claims at Boulder have been bonded to E. D. Sullivan for \$25,000.

Butte Miner: The Anaconda has ordered a new hoist for the High Ore mine, to be made of steel and capable of a depth of 4000 feet. A crosscut has been run from the 1600, and with diamond drills the company has explored, following the lead 1000 feet deeper than the deepest shaft in the camp. High-grade copper ore has been brought up by the drills. It is stated that in future the Anaconda Co. will put in steel hoists when replacing the old ones capable of operating the mines down at least 4000 feet. —It is expected that the trouble over the Nippur claim of the M. O. P. with the Anaconda Co. will soon be adjusted and shipments of ore resumed. The Nippur, which is the property of Heinze and associates, has developed into a producer, and there is a large body of high-grade copper and silver, from which shipments were made up to the time of the injunction. The silver values in the Nippur ores run higher in proportion to the copper than in any of the big mines of Butte, with the exception of the syndicate group of the Anaconda Co. —At Phillipsburg last week the Granite bimetallic mining properties were closed down, the miners and all others, except a watchman and one or two men, were laid off without date.

COLORADO.

BOULDER COUNTY.

The Culbertson mill at Boulder, from a shipment of two cars of \$5 mill dirt from the Big Five, showed a saving of 90 per cent concentrated seven into one. A shipment from the Star returned a saving of 90 per cent, and a twenty into one concentration from the No. 5 mine showed a saving of 84 per cent.

The Crown Point mining property at Eldora has been sold to Lang & Moor for \$17,000. Developments prove this to be a good free gold proposition of high grade. A tunnel has been started that will cut the ledge 1000 feet deep.

CLEAR CREEK COUNTY.

(Special Correspondence). —The Georgetown district, in Clear Creek county, includes the properties around Georgetown, Silver Plume, Empire, Silver Creek and Lawson. The largest mines are near Silver Plume and consist of the Mendota, Pelican-Dives, Smuggler, Seven-thirty, Dunderburg, Pay Rock and Cory City, which are all regular shippers. The Dunderburg, Seven-thirty, Pelican, Pay Rock and Cory City have similar ores, averaging 200 ounces silver, 15 per cent lead, with some zinc. The Mendota and Smuggler groups are heavy lead producers, averaging 50 per cent lead, 60 ounces silver and $\frac{1}{4}$ ounce gold.

At Georgetown the Centennial produces an ore which averages about 20 ounces silver, 2 ounces gold, 8 per cent copper and 8 per cent lead. The Griffith, in the same locality, yields ore averaging 50 ounces silver, 1 ounce gold, 20 per cent lead and 5 per cent copper. The Doric tunnel is a big enterprise at Georgetown. Thus far it has been driven in about 3000 feet and if continued will cut the Griffith, Richmond and Hood lodes.

Up Leavenworth gulch from Georgetown are the Kirtley, Aliundi, Equator and others. The Kirtley has shipped ore which averaged 500 ounces silver and 25 per cent lead. The Aliundi ore is also very high grade.

The Moscovite, Mineral Chief, New Boston and Smith & Wesson, near Georgetown, produce high-grade lead ore, much of it running 60 per cent in lead, 12 ounces silver and \$2 gold. The Polar Star and Rogers ship ore averaging 250 ounces silver.

Silver Creek, which is 2000 feet above the railroad at Lawson, is the location of the American Sisters and the Joe Reynolds, which are producers of high-grade silver ore with some lead. The Joe Reynolds has a well-known lead as a producer for many years. It is developed through a tunnel 624 feet long, at the breast of which a shaft sinks 700 feet, from which nine levels are run on each side; from the tunnel an upraise goes 400 feet vertically, making development 1100 feet deep on the vein. The ore now produced runs from 60 ounces to 350 ounces silver.

The Georgetown district shipped an average of over 1000 tons of ore per month for 1897. It is assumed the record for 1898 will be about the same. The cash paid mine operators for ore during 1897, after deducting freight,

sampling and smelting charges, amounted to \$704,000.

Most of the work progresses under the leasing system, which proves very satisfactory. The royalties paid will average about 40 per cent. The lessees, when they hire help, pay \$3 per day. The wages paid by mine owners, where they operate the mines themselves, is \$2 50 per day.

At Empire there are two mills operating. The Atlantic mill was closed up by the mortgagees on the 9th inst. —Wascott. Georgetown, Colo., Aug. 10th, '98.

Near Georgetown, a strike is reported said to run \$280 per ton. This is aside from the silver, which runs 222 ounces to the ton.

CUSTER COUNTY.

The Terrible mine at Isle has enlarged its mill to a 200-ton per day capacity. The mine was at one time a producer of lead carbonate, known as cerussite—the crystallized carbonate. Greater depths have produced a change in the character of the ore, which now requires concentration.

EL PASO COUNTY.

Building the Southern Cross cyanide mill, Woodland Park, is being pushed, and it will probably be at work early in the fall. The mill will be fifty tons daily capacity.

At Victor the Victor gold mining report for the first six months of the year shows: Receipts from ore sales, \$361,304; expenses, \$123,724; net, \$237,580; cash on hand June 30th, \$130,894.

The Keystone, Cripple Creek district, is shipping ore in car lots running \$40 a ton. —The new Elkon strike is an ore shoot, 5 feet or more wide, 600 feet long, extending from the second to the fourth level. Screenings from it run \$200 per ton. —The McVickers-Sellar's lease on the Lucky Guss shipped ten sacks, ranging from \$195 to \$221 a ton. The strike was made in an abandoned shaft 60 feet deep. —A 4-foot lead of from \$10 to \$20 ore has been opened by Burns & Co. on the Lucky Guss. The Ashby lease on the same property marketed thirty tons of five-ounce ore. —The leasers on the Vindicator are taking out forty tons daily that runs \$90 per ton. The Vindicator mine is keeping up its production of 1600 tons, which is the maximum capacity of its equipment. —The Modoc has been shipping one car a day for two weeks. The ore is high grade. —The lessees on the Blue Bird are outputting thirty tons per day. —A car day is the output from the Baker lease on the Los Angeles. —An eighteen-ton shipment made by lessees from the Favorite ran 3.35 ounces.

—Sixty-eight tons of ore came from the Union properties last week. The better grade ran from \$600 to \$1000 per ton. —A 3-foot vein assaying from \$120 to \$180 has been discovered in the Lucky Taylor lease of the Dante at Victor. —J. K. Vannetta has secured a lease on the main workings of the Pharmacist for eighteen months with a royalty of 25 per cent. He is required to sink 200 feet, which will bring it to 665 feet.

H. Guyot has sold three claims near Victor to Boston men for \$11,000 cash. Guyot also sold two patented claims on Straub mountain, which will be prospected by a tunnel 1600 feet.

GILPIN COUNTY.

The Jones mine, near Nevadaville, has resumed work, cleaning out and repairing the shaft, preparatory to sinking. A mill test on the dirt ran \$10 per ton, and a shipment of smelting ore yielded \$118 per ton. The property has been idle a long time.

Lessees of the East Nottaway mine, near Central City, in five weeks took out about twenty tons of ore, for which they received returns of \$2757.99, with six tons yet to be accounted for.

GUNNISON COUNTY.

The Maid of Athens group and the Citizen group of mines at Pitkin have been sold for \$104,000, the cash payment amounting to \$46,000. The owners propose to do thorough development. Both groups have been idle for some years.

HINSDALE COUNTY.

C. E. Dewey, manager of the Hidden Treasure mine and mill, near Lake City, Colo., reports the new concentration mill running regularly on hard quartz and galena ores. The equipment consists of crushers, rolls, Wilfley tables and jigs. None of the ore is crushed finer than a 10-mesh. The concentrates shipped are about 60 per cent lead. The capacity of the mill is 100 tons per day. The power is water which also runs a dynamo for an electric hoist at the mine. A new air compressor is being put in for air drills.

The St. Jacobs mine at Carson is being unwatered. —Work on the Superior property at Carson will be started soon. This has produced many tons of first-class ore, but has been idle for some time, owing to litigation.

LAKE COUNTY.

The Dyatt lease on the 1200-foot shaft of the Gallagher mine, at Leadville, is shipping 125 tons daily of iron sulphides. Considerable new development work is under way. The water at this depth is not troublesome. —The Small Hopes M. Co., near Leadville, is working through its 1430-foot, three-compartment R. A. M. shaft. Eighteen teams are daily hauling three loads each of iron sulphides daily, which is equal to 360 tons. These mines are now the heaviest shippers in the district, and the ore body is said to be six sets high. This tonnage comes from the Marion-Cyclop and Venus leases which is bought by three different smelters in the State. The water from these workings is handled through the company's Robert Emmett shaft, which also handles the Mahala water as well as the overflow from the Maid of Erin and Wolfstone workings. —The lessees on the Wolfstone mine are sending to the smelter thirty-five tons of ore daily. The ore comes from the 700 level.

The Mab mine, Leadville, since getting good air by connection with the Mahala, is shipping daily seventy-five tons of lead sul-

phides to the smelters. This output will be increased as room is gained in the stopes.

LA PLATA COUNTY.

Near La Plata the Golden Rose is shipping ten tons per week. The ore runs five ounces gold per ton.—On the East Mancos the North Star mill is running night and day, crushing twenty-five tons per day.—The Yellow Eye is taking out shipping ore.

OURAY COUNTY.

Two hundred and twelve cars of ore were shipped from Ouray in August.—The shipment of ore from the Kheide and Bachelor in July was 150 tons. Only high-grade ore is shipped from these mines.

RIO GRANDE COUNTY.

The Homestake vein at Jasper has been cut at depth by a crosscut tunnel 160 feet long and shows a 7-foot vein of sulphide ore averaging \$11.65 per ton in gold. The tunnel cut through a 25-foot body of decomposed quartz carrying values of \$7 per ton.

SAN JUAN COUNTY.

The Esmeralda in the Minnie gulch district is shipping sixty tons monthly of \$40 ore. The vein varies from 6 to 24 inches and is worked by four men. The extension of the Esmeralda, the Bland, is also outputting good ore.

SAN MIGUEL COUNTY.

The Japan Mines Co., operating at Telluride, has purchased the Florida group of claims adjoining the Japan mine, for \$50,000.

Five mills for the treatment of ore have been added to San Miguel county since the beginning of the year. Two more will be built before the end of the year, while several are in contemplation for next year. The combined daily capacity of the mills erected and being built is 460 tons.

SAGUACHE COUNTY.

At Crestone Mathewson & Bangs are working copper property which returns \$60 in gold per ton, with a good percentage of copper.—The Gold Standard M. & M. Co. is still pushing development work.

NEW MEXICO.

(Special Correspondence).—W. J. Cartan has sold the Albemarle mine in Bernalillo county to the Cochiti G. M. Co., of Boston; the company is now operating successfully a modern 200-ton cyanide mill, all steel construction, and employing 250 men at Bland, Aug. 21st, '98.

Near Rinconado, the Copper Hill Co., composed of Colorado and New York capitalists, have developed a copper property and are placing machinery at the Rio Grande river three miles from the mine, from which the product for the present will be transported by wagon. The ore runs \$45 per ton in copper and carries some silver. J. P. Turner of Colorado Springs, Colo., is Gen. Mgr.

At Santa Rita 200 men are employed in the mines; the shipments of copper ore amount to over 600 tons per month. Eighty tons of iron ore are shipped daily to the smelters. The shipments of iron will be increased to 150 tons per day.—At Central, the Texas shaft has attained a depth of 428 feet. The foundations for the new mill are in place and the mill building nearly completed.—At Cooney, a big strike is reported upon the Queen mine of ore 5 feet in width assaying \$37 per ton, gold and silver.—At Mogollon, the Confidence mine, operated by the Helen Mining Co., is running steadily, employing about seventy miners and producing eighty tons of ore per day.

Bland Herald: The Albemarle plant, at Bland, with a capacity of 125 tons of ore per day and an ample supply of ore on hand in the dumps and stopes of the mine, has been completed and is running satisfactorily. It is understood that the present saving is 88½ per cent from \$10 ore and that this amount can be increased. As a first result, with new machinery and piping, this saving is considered high.

ARIZONA.

Near Ehrenburg at the Daisy mine the ledge is said to be 24 feet wide. The ore plates \$12 per ton and carries a good percentage of fair grade sulphur.

J. Potter of Salt Lake City has bonded several properties near Dos Cabezas, Cochise county, and will begin their development at once.—The Commonwealth M. Co. at Pearce intends to shortly erect a 20-stamp mill to take the place of its pulverizers, which are not giving satisfaction.—A tunnel in the West Oro Bonito mine, Tiger district, Yavapai county, exposed a 2-foot vein of \$40 ore.—The shaft of the Diamond mine in Gila county is in good sulphide ore.—The Blackfoot mine in Todd basin, Mohave county, has 3,000 feet of tunnels, shafts and stopes. Ore is taken out that averages \$125 per ton, the pay chute being from 4 to 6 inches in width. About \$40,000 worth of shipping ore has been taken from the mine.—The Congress shaft has been sunk 150 feet deeper. The men are now opening a station at the 1850-foot level.

There will be three new steam hoists erected on mines at Chloride, Mohave county, this fall.—The Commonwealth Co. is shipping from Pearce six carloads of ore a week.—Preparations are being made for the erection of a 40-stamp mill on the Del Monte group of mines at Harqua Hala, Yuma county, recently sold to Eastern capitalists.—Bisbee is a shipping point for ore from Sonora. Every day several wagon loads are brought up. Twenty tons arrived from San Miguel Thursday.—F. McCann & Co. are building a cyanide plant on Gleason mountain to do custom work. The whole of the Cedar mining district abounds in cyaniding ores.—Twenty-five men are on the payroll of the Spenazuma M. Co. at Black Rock. A smelter of 500 tons capacity is said to be on the way, and ground is being prepared for it. The miners are engaged in running tunnels and crosscutting.—The Nighthawk mine, near Kingman, is reported to be clearing \$200 per day. Lyons & Dewey had a carload of ore from

the Prince Albert mine, White Hills, worked at the sampler which netted from two tons 1900 ounces silver and one ounce gold to the ton, while the balance ran over 200 ounces silver and one-half ounce in gold. It was thought that the Prince Albert mine was worked out, but indications are that there will be many hundred tons taken from the old mine.

Yuma Sun: A new strike on the Mountain Rose and Monitor claims, in Gila county, runs 14½ per cent copper from the lowest grade ore. The ledge is 10 feet wide, and there is enough ore in sight to run a 60-ton furnace.—In the Arade silver mine, in Pinal county, at a depth of 147 feet the vein is 4 feet wide, and contains sixty-one ounces silver and \$2 in gold per ton.—The White Hills M. Co. of Mohave county recently shipped 1000 pounds of silver bullion to San Francisco.—Work has begun on the Pay Roll, at Chloride, and on the Twiss and Champion, near Cerbat, in Mohave county.

MEXICO.

The Reina mine near Cusiuhcachi is producing a large amount of good ore. It has 4000 miners at work. Last year it produced \$500,000 silver and has an equal amount on the dump. The Santa Elena, in the same district, ships forty to seventy cars of ore daily to the smelters.

At San Miguelito, Sonora, the San Miguelito G. M. Co. has been operating successfully for five years and is now working at a depth of 500 feet on a vein of ore averaging 3 feet in width and yielding \$40 per ton gold value.—Last week the Santa Rosalia M. Co., Nogales, shipped another carload of high grade gold ore.—El Urbabo Con. M. Co. is doing work near Torres. The new hoist is in operation; the shaft has reached 115 feet, and ore is coming out which runs 1000 ounces in silver and \$30 to \$40 per ton in gold.

PERU.

The smelting works of the Backus & Johnston Co. at Casapalca are the largest in Peru. The company is composed of J. Backus of Brooklyn, N. Y., J. H. Johnston of Bath, Me., and H. Guyer of Idaho. The smelter is situated at Casapalca, on the Oroya railroad, in the Andes, ninety-five miles from the sea, at an altitude of 13,606 feet. The Supt. is F. Pierce of Denver, Colo. About 500 men are employed. The vein is 7 feet wide and some of it assays 159 ounces of silver to the ton. The tunnel is 3000 feet below the outcroppings of the ore.

Obituary.

JOHN PERSCHBAECKER died from paralysis in San Francisco on the 21st inst. He was the owner of the Napoleon group of mines in Mexico, and was the discoverer and original owner of the Perschbaecker mine, Magalia, Butte Co., Cal. He was 75 years old.

CH. H. OGDEN, PH. D. M. E., died at Rosario, State of Sinaloa, Mexico, Aug. 2, 1898, of gastritis. He was a native of Ulster Co., New York, aged 58 years and was a well-known mining engineer and metallurgist in the States of Nevada and California. In the former State he operated at the Tybo mine, Belmont and Reveille; was also connected with the U. S. Topographical Survey under Lieutenant Wheeler, U. S. A. For several years he was with the chemical department of the California State Mining Bureau and conducted later a laboratory in San Francisco for investigations of the cement and asphalt deposits of California. (Kingman, Arizona, papers please copy.)

Recent California Mining Incorporations.

Commercial Paragraphs.

The Dearborn Drug and Chemical Works of Chicago have recently analyzed fourteen boiler feed waters and shipped two carloads of suitable scale solvents to large sugar concerns in the Hawaiian Islands.

The government of Victoria, Australia, has placed an order with the General Electric Co. for six Thomson recording watt meters of 100 volts and varying capacities. These will be deposited in the electrical bureau of the home office of Victoria, and will be used as the official standards by which all electricity meters used in the colony will be tested. In future no meters measuring electrical energy will be allowed to go into service in Victoria unless they agree with those just ordered and receive the final sanction of the Victoria government.

The Denver Engineering Co. have this week shipped to the British Columbia Bullion Extracting Co., Ltd., at Silica, British Columbia, a 75-ton cyanide plant, together with

all the electrical machinery to be used in the mill, amalgam pans, time samplers, etc. This is the second cyanide plant they have shipped to British Columbia this month. They have also shipped a carload of their new style water jackets to one of the Colorado smelters.

Recently Declared Mining Dividends.

South Swansea, Utah, \$7500; Aug. 23.

Mammoth, Utah, \$20,000; payable immediately.

Yellow Aster, California, \$35,000; payable immediately.

War Eagle, B. C., 1½ cents per share, \$24,750; payable immediately.

Mercur, Utah, \$25,000; Aug. 25.

WANTED.

Partner in Extensive Placer and Quartz Mines. Free wood and water. JAMES ARTHUR, Cornucopia, Union Co., Oregon.

Wanted by Sept. 1st an Experienced Assayer and Retort Man.

Daily assays and mine books to keep for ten-stamp mill, one day from San Francisco. Pay \$75 per month. Address, with references and experience, R. A. B., care this office.

POSITION WANTED.

By Superintendent of Mine and Mill, Having twenty years' experience in assaying, mining and milling gold and silver ores, and bullion refining.

Also familiar with the separation of gold from copper without acids, as practiced in Colorado. Have served four years as assayer in U. S. coinage mint. Address "Mine Supt.," Mining and Scientific Press Office, San Francisco, Cal.

Mine Wanted.

Man of experience will develop gold mine for ¼ interest, or will bond whole property and develop. Must have ore chute IN SIGHT. State exact conditions. Correspondence with owners only. Address P. O. Box 887, Los Angeles, Cal.

WANTED.

METALLURGIST and PRACTICAL SMELTER

Will be open for engagement October 1st as Superintendent of Copper or Lead Smelting Works.

Thoroughly competent in analyzing assaying, and handling men. Speaks Spanish. Excellent references. Address SMELTER, care Mining and Scientific Press.

Mine Operator Wanted.

The owner of a Mine (Lead, Silver and Gold), situated in the State of Nevada, near railroad, would like to get a partner willing to take charge of the property and work it, or form company. No money wanted; the owner has confidence in the value of the mine and will take his chances. Property consists of two claims, 1500x600 feet; both have been worked and ore shipped to different reduction works. The owner, being engaged in other business, has no time to attend to the mine.

Address E., this office.

MOTHER LODE MINE FOR SALE.

THREE CLAIMS UNDEVELOPED AND IN close proximity to several best paying mines of Tuolumne Co. Address OWEN R., care Mining and Scientific Press.

FOR SALE.

1 Rock Breaker, 1 5-Foot Huntington Mill, 3 2-Ducan Concentrators, 35 H. P. Boiler and Engine, Shafting, Pulleys and Belting. Machinery but little used. Will sell for one-half San Francisco costs on board cars at Halley. Address L. C. BAILEY, Halley, Idaho.

Gold Mine for Sale.

Eight Claims on Mother Lode, Calaveras Co., Cal. Twenty-stamp mill building, and ten stamps. Some development work done years ago, including shaft 500 feet deep. Trustee offers at low price. For particulars address KNOX, care Mining and Scientific Press.

FOR SALE.

A complete set of California State Mining Reports and Bulletins. Address H. L. T., this office.

MINE FOR SALE OR BOND.

GLOBE BATTERY STEM GUIDE.

PATENTED AUGUST 24, 1897.

RIGID. SIMPLE. DURABLE. EFFICIENT. ECONOMICAL.

Effect a Saving in Friction Losses. No Trouble to Install. No Alterations of Mill Necessary.
No Keys or Wedges to Adjust.

Manufactured only by GLOBE IRON WORKS, STOCKTON, CAL., U. S. A.
Manufacturers of All Classes of Mining Machinery. Estimates Furnished.

OFFICE OF WILDMAN GOLD MINING COMPANY, SUTTER CREEK, CAL., June 28, 1898.
Globe Iron Works, corner Main and Commerce Streets, Stockton, Cal.—GENTLEMEN: Replying to your inquiry about the Globe Patent Battery Stem Guides furnished us by you last fall, will say that you supplied us with Guides enough for ten stamps of the Wildman Mill. These Guides have been in constant use for the past eight months, and so far do not show any wear—either on the Guides or the Stems. They are more convenient than any Guide I ever handled, and much time is saved with them in changing stems, etc. The Guide can be set so close you always get a fair blow on your dies, and the use of these Guides materially increases the crushing capacity of your batteries. It is our intention to replace all of our Guide-4 with those of your make, and I cheerfully recommend them to anyone desiring a good, serviceable and economical Guide. Very truly yours, JOHN ROSS, JR., Superintendent.

The Wilfley Table is fully covered by U. S. patents Nos. 580,338 and 590,675. Infringements will be prosecuted to the full extent of the law.

PRICE, \$450, F. O. B., San Francisco.

Some Practical Reasons Why the Wilfley Concentrator Should Be Used in Gold Mills:

One of these machines will take the place of two or three belt concentrators of any style and do very much better work.

1. It will successfully handle three or four times more material than any belt concentrator made, without exception.
2. It will save more sulphurets in proportion while so doing, and catch any float gold, amalgam or quicksilver which may escape from mortars or plates.
3. It will make cleaner and much more valuable concentrates, thus saving useless expense for transporting valueless material, as also extra cost for treatment.
4. It requires little or no attention when once adjusted and no expert is required to either adjust or run the machine.
5. It will save much expense in power and room, and the first cost of a mill requiring concentrators.
6. It has no expensive belts to crack and wear out, nor complicated machinery to keep in repair.
7. It is the only sensible plan of concentration, as any kind of material can be worked, which is not true of any style of belt machine.

DOUBLE CYLINDER SINGLE DRUM HOIST.

MINING AND MILLING MA- CHINERY.

THE above form of Hoist has certain features of construction which make it superior to all others. It is mounted on a single solid base, with standboard for the operator. The engines are reversible link-motion and the drum is fitted with post brakes and helical teeth, which assure quick and safe operation. The design is compact and superior and the construction strong and substantial. We furnish them either with or without clutch pinions. The above cut illustrates an 8½ inch by 10 inch. Other sizes in stock and built to order.

PATENTS

DEWEY, STRONG & CO'S PATENT AGENCY.

Our U. S. and Foreign Patent Agency presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American reports, with full copies of U. S. Patents since 1872. All worthy inventions patented through DEWEY, STRONG & CO.'s Patent Agency will have the benefit of a description in the *Mining and Scientific Press*. We transact every branch of patent business, and obtain patents in all countries which grant protection to inventors. The large majority of U. S. and foreign patents issued to inventors on the Pacific Coast have been obtained through our agency. We can give the best and most reliable advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and circulars free.

Canton Steel Co., Denver, Colo.

GENTLEMEN:—The Canton Steel has been handled by us for the last two years, during which time we have had only two complaints, and in both cases the trouble has been lack of knowledge of tempering on part of the blacksmith doing the sharpening.

The English steel has been entirely knocked out in our section, as the Canton steel has taken its place at half the cost.

We have tried many well-known brands of American steel, but none have given such entire satisfaction as the Canton.

There is no rock too hard for it, and it will stay wherever introduced.

Yours truly,

THE MCCORMICK-SAELTZER COMPANY,

REMEMBER! THE STATE FAIR

WILL BE HELD AT **SACRAMENTO,**

SEPTEMBER 5th TO 17th, 1898.

This Annual Exhibition Covers a Broad Field and Brings Together People That Have Many Interests.

THE INDUSTRIAL DISPLAY

Made each year in the commodious Pavilion embraces a most general assortment of the artisan's work.

NEW DEVICES IN MINING

Machinery can be shown here to an advantage, as the extensive mining region contiguous to Sacramento makes it easy of access for those interested in this character of exhibits.

PRACTICAL PUMPING PLANTS

Are needed in many sections of the State, and those interested are viewers of these displays.

MODERN MECHANISM

Of every character is placed on exhibition at the State Fair in order to take advantage of the great crowds drawn hither by the various attractions.

THE AGRICULTURIST and general farmer makes it a point to examine, not only the improved breeds of Live Stock that form an important feature of the Fair, but all improvements in machinery and labor-saving appliances.

THE MERCHANTS of the interior of the State, the genuine distributor of wares of every description, attends the State Fair, to note the progress in all lines of trade.

THE MANUFACTURERS and their representatives cannot afford to ignore the Annual State Fair as a medium to advertise their output of goods and wares.

REMEMBER THE DATES.

MINE BELL SIGNALS.

Adopted, Used and in Force in Accordance with State Law.

For the convenience of our readers in the mining counties we print in legal size, 12x36 inches, the Mine Bell Signals and Rules provided for

in the Voorhies Act, passed by the State Legislature and approved March 8, 1893. The law is entitled "An Act to Establish a Uniform System of Bell Signals to Be Used in All Mines Operated in the State of California, for the Protection of Miners." We furnish these Signals and Rules, printed on cloth so as to withstand dampness. 50 Cents a Copy.
MINING AND SCIENTIFIC PRESS, 330 Market St., San Francisco, Cal.

Market Reports.

The Markets.

SAN FRANCISCO, Aug. 25, 1898.

SILVER.—London, 28d; New York, 60½; San Francisco, 60; Mexican Dollars, 46½@47c. London reports a Spanish demand for silver of probable continuance. It is thought that pending financial arrangements between the Spanish Government and Paris bankers are also an influence in the matter.

COPPER.—A Boston authority says: "The copper market is remarkable for its strength, when within a few weeks many of the prominent producers considered that copper had seen its top price and was on the downward move. As a result, most of the large producers sold very heavily at 11½c. The demand from Europe and this country was somewhat enormous and quickly absorbed all copper offering. Many of the mines have sold ahead until the first of January. If the present consumption of copper continues, the price of copper has got to advance very materially. The production of copper was never so large as at the present time nor the visible supply so small. While the production has increased enormously during the past five years, the consumption seems to absorb it, and while the consumption of copper in this country for the first six months of this year was the greatest ever known for that period, it is the opinion of competent judges that it will increase during the last half of 1898. The demand from Europe is simply enormous, as the heavy exports show. Bids for large amounts of copper, in some cases as high as 10,000,000 lbs. for future delivery, are being constantly declined by all the companies. I am very bullish on the copper situation and believe that if the present demand continues the price of copper will rule around 13 to 15 cents. There is nothing artificial in this movement—it is simply the result of the law of supply and demand. With our enormous exports, I do not see how copper can go down." Lake closed at \$12.15 bid, \$12.25 asked.

LEAD.—New York reports "unchanged," \$4.10 bid, \$4.12½ asked. Smelters quote \$3.90; local, pipe, 6@6½c; sheet, 6½@7c; pig, 5½c; bar, 6c. The directors of the National Lead Co. of New York have declared a quarterly dividend of 1½ per cent on preferred stock, payable Sept. 15th.

Assessment Notices.

CONSOLIDATED ST. GOTHARD MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Nevada County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 11th day of August, 1898, an assessment (No. 1) of 10 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 113 Crocker building, sixth floor, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 25th day of September, 1898, will be delinquent and advertised for sale at public auction, and unless payment is made before, will be sold on WEDNESDAY, the 12th day of October, 1898, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

J. F. HOLLING, Secretary.

Office—113 Crocker building, sixth floor, San Francisco, California.

ROSE CREEK MINING COMPANY. Location of principal place of business, San Francisco, California; location of works, Tuolumne County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 27th day of July, 1898, an assessment (No. 2) of five cents (5c) per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the secretary, at the office of the company, room 163, Crocker building, Post and Montgomery streets, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 30th day of September, 1898, will be delinquent and advertised for sale at public auction, and unless payment is made before, will be sold on MONDAY, the 26th day of October, 1898, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

J. M. WILLMANS, Secretary.

Office—Room 163, Crocker building, Post and Montgomery streets, San Francisco, California.

BOULDER MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, El Dorado County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 27th day of July, 1898, an assessment (No. 1) of five cents (5c) per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, room 163, Crocker building, Post and Montgomery streets, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 30th day of September, 1898, will be delinquent and advertised for sale at public auction, and unless payment is made before, will be sold on MONDAY, the 26th day of October, 1898, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

J. M. WILLMANS, Secretary.

Office—Room 163, Crocker building, Post and Montgomery streets, San Francisco, California.

WEST SANTA ROSALIA GOLD MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, State of Sonora, Mexico.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 3rd day of August, 1898, an assessment (No. 1) of three (3) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, No. 310 Pine street, Rooms 15 and 17, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 5th day of September, 1898, will be delinquent and advertised for sale at public auction, and unless payment is made before, will be sold on MONDAY, the 26th day of September, 1898, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

J. W. FEW, Secretary.

Office—No. 310 Pine street, Rooms 15 and 17, San Francisco, California.

LEON GOLD MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, near Winchester, Riverside County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 16th day of May, 1898, an assessment (No. 1) of 14 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, room 7, fifth floor, Mills building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 25th day of June, 1898, will be delinquent and advertised for sale at public auction, and unless payment is made before, will be sold on MONDAY, the 25th day of July, 1898, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

GOLD IN COLORADO!

Colorado has within its limits some of the greatest gold mines that has ever been discovered. In Cripple Creek in 1892 there were a few prospectors looking over the hills; in 1895 the camp turned out over \$5,000,000 in gold. Leadville, the old bonanza camp and the mineral product of which made Denver what it is to-day, is becoming a big producer of gold. New inventions for working low-grade gold ores, together with the discoveries made to work rebellious ores, have opened up a field for the miners such as they have never enjoyed before, and Colorado has inducements to offer such as no other district in the world possesses; the record of the State in gold production for the last three years speaks for itself. Among the other prominent camps in the State are Telluride, Ophir, Rico, Silverton, Mineral Point, Durango, La Plata, Ouray, Saw Pit, Ironton, the Gunnison district and many others. New finds are being made and new camps are springing into existence every day. The Denver & Rio Grande Railroad, which is the pioneer road of Colorado and which has always been the miner's friend, reaches all the mining camps in Colorado. M. CRAFTY,
Manufacturer of the Celebrated
Smelter Broom,
1554 BLAKE ST.....DENVER, COLO.

THE BROWNELL "PATENT LIP" FLANGE FRUE VANNER BELTS.

It has taken years of ceaseless testing and experimenting to produce the superior belt which we now offer, with elastic flanges and pliable body reinforced with specially woven duck. Every belt is manufactured by experienced workmen, and carefully tested on machines especially built for that purpose; consequently we are to-day manufacturing the best belts that mechanical ingenuity, combined with honesty of construction, can possibly produce.

JAS. S. BROWNELL, ESQ., San Francisco, Cal.—DEAR SIR: The Brownell Patent Lip flange belt for ore concentrators, which I bought of you nearly two years ago, has been in constant use and is in good order and gives us perfect satisfaction. We have several other kinds of belts in the mill, and your belt and flange I consider the best of all. Yours respectfully,

ORIGINAL EMPIRE MILL & MINING COMPANY,
GRASS VALLEY, NEVADA CO., CAL., Feb. 20, 1897.

ROBT. WALKER, Superintendent.

MR. JAS. S. BROWNELL, 132 Market St., San Francisco, Cal.—DEAR SIR: We have in our 20-stamp mill at this place five Frue vanners; three of these are equipped with the Patent Lip flange belt and two with the plain flange belt. We certainly consider the former a great improvement on the latter. They will certainly wear much longer, as cracking now seems out of the question. Any one purchasing the Frue vanning machine should see that it is equipped with the Patent Lip flange belt. Very truly yours,

ROANOKE MINING COMPANY,
MOKELUMNE HILL, March 4, 1897.

Per G. M. WILDE, Acting Superintendent.

Treating Zinc-Lead Ores.

A Utah subscriber asks three questions: 1. Is there any way in which ore containing the following can be treated at a profit—silver 35 ozs. per ton, lead 14%, zinc 35%? 2. Where is the best lead-zinc smelter and, approximately, what are the charges per ton? 3. What is a good book on the subject?

It would be easier to answer the first question had the questioner sent a sample of the ore. In general, the first question can be answered—Yes. The second is also difficult to answer so that the reply would be of special value. In the first place, it is hard to indicate the best method of treatment without knowing whether the ore our Utah reader has in mind is a sulphide or an oxide. Almost any first-class smelting establishment could successfully treat the ore, but, of course, the treatment charges would be different for a sulphide from an oxidized ore. There is, we believe, a smelter at Canyon City, Colorado, that makes a specialty of that kind of ore; the smelter at Argentine, Kansas, is also prepared to do that kind of work; the Selby Smelting and Lead Co., whose office is at 416 Montgomery street, San Francisco, is also fully fitted for the treatment of such ore. Before doing much, however, in the way of expenditure of money, we would advise the Utah man to be sure of the quality and quantity of his ore, and deal only with reliable people. "Processes" innumerable have been patented to treat zinc-lead ores. There is a great quantity of zincy ores easily procured, but not worth wasting effort on. Some time some smart metallurgist may devise a cheap method of successfully working them. There is a constant demand for such a process and it will be forthcoming. Meanwhile ore carrying such values in silver, lead and zinc, as stated above, ought, in sufficient quantity, to be susceptible of profitable treatment. There is always a good demand for good zinc-lead ore. For an ore carrying, say, lead 20%, zinc 25%, silver 20 ounces, Eastern smelting firms pay \$9 per ton at Denver or Pueblo, Colo., and for lead in excess of 20% or zinc in excess of 25% they will pay. That kind of ore is not plenty in Colorado. Smelter customs differ. We are not authorized to say what the Selby Smelting Co. of California would pay, but probably 95% of the silver, N. Y. quotations, on day of delivery, 90% of the lead, and would deduct \$10 for treatment. Regarding zinc, there would probably be an allowance of 10% and a charge of 50 cents additional for every 1% of zinc over 10, or in the case referred to by our Utah correspondent, $35-10=25\%-\$12\frac{1}{2}$ additional to the \$10 treatment. This is not meant to be specific or exact, nor other than an approximate estimate of what such an establishment in California, Colorado or Kansas would charge. If the ore is oxidized there would probably be an allowance by the smelter of about 15% zinc free, and a charge for the rest as stated above.

It is probable that if the ore in question is a sulphide it could be concentrated at least one-half;

similar to the proposition now successfully handled by the management of the Broken Hill Proprietary, Australia. Those people have spent enormous sums in experiments and "processes."

TORPEDO BOAT DESTROYER FARRAGUT AT TWENTY-SIX KNOTS PER HOUR.

Their ore contains zincblende and galena intimately united, requiring very fine crushing to allow the concentration of the lead to take

are in a similar position that the subject is one of general interest.

So far as we know "Hoffman's Metallurgy of Lead" is the best work on the subject.

The Torpedo Boat Farragut.

In a few weeks the torpedo boat Farragut, built by the Union Iron Works, San Francisco, will have her official trial trip in San Francisco bay. The accompanying engraving is from a snap-shot photo taken on the occasion of a recent preliminary run, when she was making about 26 knots per hour. A larger and better one will be forthcoming herein when she has her final speed trial. Much is naturally expected of the new vessel. Speaking of the vessels turned out by the Union Iron Works, every publication everywhere has the most commendatory terms. The following, from the New York *Commercial Advertiser*, is representative of the general expression: "Every ship built in San Francisco has been the best of its class in the navy. The Charleston is the best of the old cruisers, the San Francisco is the best of the new, the Olympia the best fighting cruiser in the navy, the Monterey the best of the monitors and the Oregon the best battleship of the navy."

A 30-Ton Electric Crane.

Electricity for machine driving is of constant interest to every one who has anything to do with power transmission. As illustrative of the economic advantage of direct connection is herewith portrayed a scene in one of the largest machine shops in the United States, where a 500-volt direct current motor from the Westinghouse Electric and Manufacturing Co., Pittsburg, Pa., furnishes power for a 30-ton electric crane, successfully carrying the huge casting depicted in the engraving.

HEAVY LOAD CARRIED BY A 30-TON ELECTRIC CRANE, OPERATED BY 500 VOLT DIRECT CURRENT MOTORS.

place. They have now achieved commercial success.

If the Utah man will send a fair sample of the crude ore, we will have it subjected to a quantitative and qualitative analysis, and may be able to give some definite conclusions of possible value. So many

to attempt any cheap little tricks that are sure to be found out and are as sure to hurt the whole district. One such transaction often gives a deserving locality a setback that will take years of genuine merit and proved value to overcome.

TABLE OF CONTENTS.

ILLUSTRATIONS.—Torpedo Boat Destroyer Farragut at Twenty-six Knots per Hour; Heavy Load Carried by a 30-ton Electric Crane, Operated by 500 Volt Direct Current Motors, 225. A 2000 H. P. Triple-Expansion Mill Engine, 232.
EDITORIAL.—Treating Zinc-Lead Ores; The Torpedo Boat Farragut; A 30-ton Electric Crane, 225. Co-ownership and Forfeiture; Disappointment of Men Lured to the Klondike, 236.
MINING SUMMARY.—From the Various Counties of California, Nevada and Other Pacific Coast States and Territories, 233-34-35.
THE MARKETS.—The Local Markets; Mining Share Market; Sales in San Francisco Stock Board, 246.
MISCELLANEOUS.—Concentrates, 227. Mines of Kalgoorlie, Australia; An Electrical Regulator; An Important Chemical Achievement; Waterproof Gelatine Paper, 228. History of a Mine; The Treatment of Argentiferous Lead; Alloys of Aluminum; An Interesting Fact; Latest Development in Field Telegraphy; Is Darwinism True? 229. Hydraulic Illustration of the Wheatstone Bridge; The Fire Resistance of Structural Iron; The New Wide Tire California Law; A European Magnetic Ore Separator; A "Breath Figure"; Converting Crude Iron Ore into Fine Steel, 230. Coast Industrial Notes; Personal; List of U. S. Patents for Pacific Coast Inventors; Notices of Recent Patents, 231. A 2000 H. P. Triple Expansion Mill Engine; Cure for Rattlesnake Bites; Warnings by Sound to Vessels in Fog; Duodecaplex Telegraphy; Riveted Pipe Steel; The Stability of the Solar System; Maritime Powers of the World; Filling Cracks in Floors, 232. Recently Declared Mining Dividends; Recent California Mining Incorporations, 235. Commercial Paragraphs, 246.

Co-Ownership and Forfeiture.

In the issue of August 6th in answer to some questions regarding joint ownership of mining claims, in the States of California, Colorado and Idaho, the "advertising out" of delinquent co-owners was referred to. From several communications received since then it is evident that the method of forfeiture prescribed by Section 2324, Revised Statutes of the U. S., is not wholly considered just, and the claim made with some show of reason that such procedure may be made the means of practicing fraud.

It is possible to imagine how fraud might be wrought by exact legal observance of the statute, but the statute itself contains ground for redress on the part of anyone considering himself aggrieved. "Advertising out" a recalcitrant or delinquent co-owner is in one sense about the same thing as selling stock in a corporation delinquent for assessment. However, the subject is an interesting one, and has been made the theme of considerable judicial decision and legal discussion. The latest and in some ways the best treatment of the question recently observed is that in "Lindley on Mines," pp. 813-820, where, discussing on this subject, the author comments as follows:

The manifest object of these provisions is to afford a speedy and convenient method of taking away the property of one cotenant and giving it to another without the troublesome intervention of either courts or juries. There is no antecedent adjudication of either the fact of delinquency on the part of one co-owner or the making of the required expenditures by the other. THE PROCEEDING BY WHICH THE FORFEITURE IS WORKED IS EX PARTE, EXTRAJUDICIAL AND DESERVES TO BE CLASSIFIED UNDER THE HEAD OF EXTRAORDINARY REMEDIES.

In the case of Brundy v. Mayfield, considered by the Supreme Court of Montana, it was urged that this portion of the Federal statute was repugnant to the Constitution of the United States, as it was an attempt to deprive persons of property without due process of law. The court did not pass upon the question. The exigencies of the case did not require it. Another method, quite as efficacious, was discovered, which enabled the court to declare null and void the proceedings under which one co-owner sought to acquire the title of the other by "advertising out." In this case there was a total absence of any delinquency.

The Supreme Court of the United States, in the case of Turner v. Sawyer, held that the statute was one of forfeiture and should be strictly construed. The estate of the alleged delinquent co-owner in this case was saved from forfeiture for the reason that the person attempting to advertise him was not a co-owner. In deciding the case the court takes special pains to reannounce the familiar rule heretofore referred to, that cotenants stand in a certain relation to each other of mutual trust and confidence; that neither will be permitted to act in hostility to the other in reference to the joint estate, and that a distinct title acquired by one will inure to the benefit of all.

In the case of Black v. Elkhorn, the same tribunal, speaking through Justice Peckham, stated that this est, to-wit, the quasi legal title. The method pro-

vided for in the statute under consideration is wholly *in invitum*. We would not be justified in dogmatically asserting that this process of advertising a co-owner is clearly unconstitutional. But we think we may safely assert that wherever the law is invoked THE COURTS WILL DEMAND STRICT PROOF OF THE FACT OF DELINQUENCY, and of the full and fair compliance with each requirement of the law.

Of course, to prevent a mining claim from becoming subject to relocation, it must be fully represented. A partial performance by one co-owner will not save his interest. Representation is a unit, and as one co-tenant, in order to protect his interest in the location, may be compelled to expend more than his just share, those associated with him should be compelled to contribute their respective proportions. Failing to do so, the one performing the labor, or making the required expenditures, would have his right of action against the delinquent co-owner. The right of one co-tenant to contribution from others for expenditures made in removing a common burthen is well settled. This method of obtaining redress would seem to fully protect the diligent cotenant, and would not be subject to any constitutional objection.

The Federal statute does not seem to provide any adequate method of establishing the jurisdictional facts upon which the right to forfeiture is based, nor of proving or making a record of a compliance by the diligent co-owner with the requirements of the law in securing a forfeiture to himself. An *ex parte* affidavit, made by a co-owner claiming a forfeiture, could not be admitted in evidence, nor would the record of such affidavit impart notice to any one. Constructive notice by recording is wholly a creature of the statute. A record not provided for by statute, or recognized by law, gives no notice. The lameness and imperfections of the Federal statute, to use mild terms, have tempted several of the States to supply the deficiencies by supplemental enactments.

We have heretofore expressed the view that such statutes are not within the legitimate scope of supplemental State legislation. The land department follows the rule, that where one of several co-owners applies for a patent, and in so doing excludes his co-tenants, the latter can only protect themselves by proceedings to determine an adverse claim under Section 2326 of the Revised Statutes. In other words, the department will not try the question of forfeiture nor adjust equities between co-owners. But it is not to be inferred from this that the excluded cotenant is, by a failure to adverse, barred from asserting his rights after patent. If he has been wrongfully excluded, he may have a trust declared at any time. The regulations of the land department, whereby a party may be held to prove his better claim to enter, do not oust the jurisdiction of the courts. A co-tenant excluded from a patent application may adverse, and perhaps under certain circumstances, where the claim is held in open hostility and there is an emphatic and well recognized repudiation of his title brought to the notice of the delinquent, his asserted rights may be jeopardized by failure to adverse; yet, as a rule, his equities may be asserted after patent has issued.

The object of this section is simply to invite attention to that portion of the Federal law which purports to sanction a forfeiture for the benefit of a co-owner. All courts agree that the statute must be strictly construed. Certainly no presumptions of either fact or law will be indulged in when its application is invoked. Drastic punishments for minor offenses frequently secure immunity to the offender. The same principle applies with equal force where unusual and severe methods of redressing private wrongs or enforcing private rights are attempted. The courts are not disposed to deal with them in a spirit of liberality.

CRUEL disappointment has been the portion of many well-meaning men lured to the Klondike in the mad rush of the past fourteen months. This paper has steadily discounted the extravagant stories, has told the exact truth as furnished by expert miners and has thus dissuaded many from losing health, fortune and life itself in the insane scramble. That the Klondike is at present unexcelled anywhere as a great gold producer is manifest; that it is no place for a poor or sickly man is equally manifest; that that whole region will continue to furnish large quantities of gold for many years to come is certain; but no one should think of going there unless fully equipped in every way for the adventure. Strong, young, resolute, hardy men of buoyant temperament, possessing qualities of endurance, not easily discouraged and with abundant means, can, together, win fortune there (or anywhere else); but weakly ne'er-do-weel, inexperienced, disappointed, broken-down men cramped for funds, should stay away. Everything in the way of alleged "news" in the dailies and some of the weeklies should be doubly discounted. Now

was one of the methods by which a locator's estate might be lost; but in that case no question concerning this portion of the statute was involved. The fact was recited to show that the locator's estate was not subject to a wife's dower, because it might be subject to forfeiture.

In Royston v. Miller, one cotenant claimed to have performed the assessment work for 1893, and his co-owner, having failed to contribute, was "advertised out." Judge Hawley held that the performance of annual labor for that year was excused by the act of Congress referred to in a preceding section, and therefore there was no delinquency, and the attempt to create a forfeiture was a failure.

In Billings v. Aspen Mining and Smelting Co., an effort to forfeit the interest of a co-owner was defeated, because at the time notice was published the delinquent co-owner was dead.

In a recent case decided by the Supreme Court of South Dakota, it appears that the Golden Sand Lode was located in 1878 by Havens & Wilsey. Wilsey died the same year. An administrator was appointed, but died in 1888, leaving a vacancy in the administration until 1893. After Wilsey's death, Havens performed the annual work each year from 1880 until 1887. Thereafter and during the vacancy in the administration, Havens published two notices, one demanding contribution for labor performed during the eight years, and one covering the period of 1887. The notices were addressed, "To Rufus Wilsey, his heirs, administrators, and to all whom it may concern." Presumptively this notice was published for the statutory period. There was no personal service. The heirs-at-law were all non-residents of South Dakota. In 1892 Havens sold to one White, by deed purporting to convey the entire claim. White caused the claim to be relocated under the name of North Lode, under which relocation the claim passed to patent, and in 1893 as patented was conveyed to the Horseshoe Mining Company. It was claimed that White, in making the purchase, perfecting the relocation and securing the patent, acted as the agent of this company.

In 1893 Elder, who had been appointed administrator of the Wilsey estate, together with Wilsey's heirs, tendered to the Horseshoe Mining Company one-half of the amount of the annual expenditures required to be made on the claim from 1878 to 1893, and demanded a deed for one-half the property. The tender and demand being refused, Wilsey's administrator and heirs brought the suit to recover one-half of the property.

At the trial the published notices were offered in evidence, and objection to their introduction was made on numerous grounds. The trial court sustained the objection, giving as a reason for its ruling that, "The evidence in this case shows that Rufus Wilsey was dead, and that there was no legal administrator; his administrator was also deceased at the time this notice of forfeiture was published, and that, therefore, his co-owner gained nothing by it," practically following the ruling in Billings v. Aspen M. & S. Co., heretofore referred to.

that the war with Spain is about to be settled, and men's minds again begin to naturally turn to mining as the most elastic and profitable of all industries, there will come renewed notice in news columns of those far-off fields, and often the truth is the last thing thought of in many published statements. Thousands have lost all their money and thousands more their lives through belief in what they read, not realizing that much of it was paid for at so much a line by transportation companies and others interested in keeping up the "rush." As one instance is noted the fate of the 5000 men who ignorantly and foolishly followed the alleged Klondike route by way of Edmonton. Of the 5000, five got through. The greater part of the rest were ruined in health and fortune. That route was widely advertised as being absolutely practicable and free from all the hardships of coast travel. The gold of the Klondike has thus far cost this country as much in blood and treasure as the late war with Spain—much of it unnecessarily.

Concentrates.

The total dividends paid by Utah mines in August amount to \$147,250.

The 520 additional stamps for the Alaska-Treadwell properties each weigh 1050 lbs.

Water at Randsburg, Cal., is now but 25 cents per bbl., as compared with \$3 one year ago.

The De Lamar mine, De Lamar, Nevada, is credited with a monthly gold output of \$100,000.

MOR. F. S. BAILLIE, Baker City, Or., is about to put a \$100,000 gold mill plant on the Columbia mine.

CRIPPLE CREEK, Colo., is finding the value of hand jigs, which are coming into general use in that camp.

The coal exports from Belgium the first half of the present year were 2,234,710 tons, and of iron 302,237 tons.

SILVER 1000 fine from the Ontario tailings was shipped last week from the Marsac refinery, Park City, Utah.

THE Coalinga, Cal., oil producers are at present getting about 85 cents per barrel for their oil at the wells.

BOSTON reports are that the Calumet & Hecla has sold all its copper up to Nov. 15th, and is now out of the market.

At the opening of the late war with Spain, silver was quoted at 54.9 cents per ounce; it is to-day worth 60 cents.

The total July production in the Rand, South Africa, district was 359,343 ounces; it was 242,479 ounces in July, 1897.

TO FIX bolts in stonework is recommended a mixture of sulphur with Portland cement, in the proportion of three to one.

The greatest day's run made by a steamship is that of the Kaiser Wilhelm last July, from Bremen to New York—580 knots.

A DISPATCH from Vienna says that 300 miners were drowned last week by the flooding of the Kasimir coal mines at Nienice, Silesia.

WM. ANDREW, manager Young America Mining Co., Tuscarora, Nevada, wants bids for the construction of a 10-stamp gold mill.

The Arizona Copper Co. at Clifton, Ariz., is erecting a two-story brick building for a library, which will be free to its employees.

In the construction of the Highland Boy smelter at Bingham, Utah, for which work began last Monday, 300 men will be employed.

The *Union-Democrat* says that the Black Oak mine, near Soulsbyville, Cal., though a gold producer, in 1897 yielded 11,917 ounces of silver.

ELECTRIC machinery arrived at Grass Valley, Cal., for the North Star mine last week weighing forty-five tons. The freight bill was \$1100.

For the fourth consecutive time the Homestake M. Co., S. D., paid an extra dividend last month, aggregating \$62,500, a total to date of \$6,931,250.

UNDERGROUND or surface storage of mine explosives both have their dangers. Experience in the choice of two evils favors the surface system.

AN ordinary man with a 6-lb. single hand hammer can strike forty 90-lb. blows per minute; with an 8-lb. hammer forty blows of 125 lbs. per minute.

THE American Placer Mining Co., Oro Fino creek, Pierce district, near Kendrick, Idaho, are spending \$30,000 for a fall run on their placer property.

THE closing down of the Poorman mill, Florence, Idaho, is said to be caused by inability to determine the needed process for profitably working the ore.

QUESTIONS can not be immediately answered herein. Some inquiries require two or three weeks before an answer, even approximately correct, can be given.

THE recent rise in silver has made the exhibit of refined silver bars at the Omaha Exposition worth \$30,000 more than it would have sold for when the exposition opened ninety days ago.

It is a matter of general experience that gold ores to the value of \$40 per ton or over, where not free-milling, are better fitted for some other form of treatment than the cyanide process.

P. H. VAN DIEST says there is no tin, as reported, near Walsenburg, Colorado. The owners have spent about \$10,000, which they probably could have saved by proper preliminary examination.

THE average evaporation of water in open reservoirs is about 60 inches per year. A reservoir of 100 acres area requires an inflow of $\frac{3}{4}$ cubic feet per second to maintain its loss: a 500 acre area about $3\frac{1}{2}$ cubic feet.

THE mean pressure of the atmosphere is usually estimated at 14.7 pounds per square inch, so that with a perfect vacuum it will sustain a column of mercury, 29.9 inches, or a column of water 33.9 feet high at sea level.

EVEN mine managers have their troubles. The Kalgoorlie, Australia, *Standard* says: "A certain Kalgoorlie mine manager had a mine under his control which held out good pros-

pects if opened at a depth. He asked his London Board for a winding engine, and immediately a 10-stamp battery was forwarded to him. As there was no payable lode on the mine the stamps were useless."

THE Oneida mine, near Amador, Jackson, Cal., is believed to be the best equipped for deep hoisting of any in California. The vertical shaft taps the vein at 1750 feet, and the plant can supply an 80-stamp mill with ore from a depth of 2700 feet.

AT Glenwood Springs, Colo., on the 23rd ult., the drilling contest for the State championship was won by N. J. McKenzie of Leadville and J. Lamb of Cripple Creek, drilling a hole 40 15-16 inches in Gunnison granite in fifteen minutes.

THE Kansas Con. Smelting & Refining Co., has bought the Union smelter at Leadville, Colo., built in '91 at a cost of \$75,000. The Arkansas Valley smelter at Leadville, also owned by the K. C. S. & R. Co., will handle its sulphides at Union.

SO FAR as known the highest voltage employed in the commercial transmission of electrical power over a long distance is that which is now operated on the lines of the Telluride Power Transmission Company between Provo canyon and Mercur, Utah.

THE *Echo der Mines* gives the following results of the analysis of a new mineral found in Algeria: Osmiridium, 64.35%; titaniferous iron, 12.15%; copper, 1.79%; palladium, 0.89%; platinum, 9.61 per cent. This mineral is said to be found in nuggets in clay.

TRANSVAAL, S. A., mine managers report increasing difficulty in securing native labor. They suggest an increase of liquor allowance at the close of the day as inducement in getting the Kafirs to work. An increase in wages might be more directly resultant.

IN South Africa the average amount of water used in stamp mills is 6.5 gallons per stamp per minute; in Australia 6.8, which figures seem extraordinarily large on this side of the ocean, where 100 gallons per hour per stamp is usually considered more than sufficient.

SPANISH papers published this week ask if "Americans feel strong enough to change themselves from gold miners into conquerors." Gold miners usually develop sufficient vim to conquer anything else. Acquisition of territory is merely incidental—simply a new location.

A MINING STAMPEDE is reported from Florence, Idaho, to Buffalo Hump, where a ledge of unusually rich gold quartz is reported discovered. Men on the ground write back that drills, powder and fuse are a necessary part of the equipment of anyone coming there to work.

CRIPPLE CREEK, COLO., has a gold bullion production record to date of \$40,000,000. In five years Colorado has changed from being the great producer of silver to the position of chief producer of gold of any American State, and expects to show a gold output for this calendar year approximating \$25,000,000.

W. A. FORD claims to have discovered an unusually large deposit of sodium sulphate "comprising millions of tons"—two miles east of the Okanogan river, on the south half of the Colville, Wash., reservation. He says he has sunk a shaft on it 10 feet deep without reaching bottom and that this deposit covers a wide area.

AT Butte, Montana, four new 20-ton converters are being put into the Butte & Boston smelter under lease to the Boston & Montana. As a result the output of the Boston & Montana will be increased and new converters used to some extent on the Boston & Montana matte. Converting for both companies has been done heretofore at Great Falls.

MINERS and prospectors in the Copper river, Alaska, country held a mass meeting at Lake Telena, July 19th, and appointed a committee to draft resolutions that the creeks from which gold had been found in the sluice boxes had been "salted" with gold brought from California, in the interest of transportation companies—a not unlikely possibility.

IN the Alice mine at Butte, Montana, F. Sando at the 300 level entered the cage, which is protected by sheet iron sides, and gave the signal to hoist to the 100. A second later he stooped over to take up a pick on the station floor; the cage started, and losing his balance, he was thrown into the shaft, falling 700 feet. He was crushed beyond recognition.

EXTENSIVE forest fires, widespread drouth, unusual heat and enforced cessation of mining operations was the untoward record of California for the month of August. So far as the California miners are concerned, the fall rains cannot begin too quick. For the last ninety days water in some parts of California has been almost as expensive to a California mining man as an introduction to a British nobleman.

A PRESENT estimate of the gold production for 1898 is \$275,000,000. The money stock of gold on Jan. 1, 1894, in the world was \$3,965,900,000—the supply accumulated since gold began to be used as money. The five years' production since, including the estimate for 1898 would, on Jan. 1, 1899, be \$1,097,000,000, coinage value, or 27 per cent of the accumulated gold money stock of the world as it stood five years before.

IN the mineral deposits of Chili iron ore occurs in abundance and usually in favorable conditions for working. The ore is generally pure and contains but little silica. M. Wiener, in the *Annales des Mines*, says that in most of the provinces the ores run about 67 per cent. They are used only as fluxes in silver smelting. No iron works exist there, though the consumption of iron and steel in Chili amounts to 40,000 tons annually.

THE temporary suspension of the Utica mine at Angels, Cal., lays off nearly 400 men. Cessation of bullion production by such large California mines as the Utica will materially reduce California's gold output for 1898, but is the natural result of the unusual drouth, which has necessitated stoppage of mining operations in many parts of the State. During the enforced idleness in the Utica the flumes and ditches will be rebuilt and the entire plant overhauled.

FROM the Klondike comes the same complaint so universally heard in California this season—lack of water. On El Dorado creek as elsewhere miners say the water was never before so low, and that the work of sluicing out the gravel heaps cannot be done this season. They console themselves by saying that it only means another year, and that, meanwhile the gold cannot get away. They also hope that by the working season of '99 the present obnoxious royalty will be lessened or abrogated altogether.

A. F. STAHL, in the *Chemiker Zeitung*, describes the petroleum fields between Baku and Petrovsk, Russia. His examination tends to show that the district between Baku and Petrovsk, excepting the west of the Apsheron peninsula, and

the low-lying lands at Kayakend, is not likely to prove a productive oil field. Owing to the demand for crude petroleum for fuel, and the success of the business at Tagieff, recently sold to an English company, oil lands were eagerly sought in that country.

NOR more than fifty men are now working in the Virginia City, Nevada, mines. Hundreds have gone to Butte, Montana, where a Comstock miner can usually find employment. The mine owners say that they could put a good many men to work at \$3 a day on low-grade ore and make it pay, but they cannot at \$1. The miners say that the reduction of wages should be shared by the superintendents. The superintendents say that the men who insist on \$4 a day in Virginia City accept \$3 in other localities.

CHROME iron ore is found in thirteen California counties, considerable deposits existing in Sonora, San Luis Obispo and Tehama counties. The only chrome works in present operation are in San Luis Obispo. That county has produced about 25,000 tons. The Tehama Co. Chrome Deposit Co., Red Bluff, Cal., has a large body of chrome ore, averaging 47%. The present low price hinders the development of the industry, gold, copper and quicksilver being the metal products of California in greatest present demand.

BOSTON papers announce that an Eastport, Me., man is about to buy the plant of the Electrolytic Marine Salts Co. at North Lubec, Me., for use as a sardine factory. This is the outfit put in by the people that were going to clear \$1000 per hour by "accumulating" gold from sea water. The company want \$40,000 for the property which cost a great deal more originally. The Eastport man thinks that the property would be most suitable for a sardine plant, as thousands of herring could be kept alive in the "accumulators."

A LETTER from Lake Lindeman, Alaska, dated Aug. 8, about the Pine Creek stampede, says that it was not then determined whether the new diggings were a fraud or genuine, but that everyone who could get away was going. "The steamboats are doing big business, charging \$25 for fifteen hours ride." Men who prospected their claims say they got \$3 to the pan on bedrock about 6 feet below the surface, that the ground does not freeze, and there is plenty of water. It is not yet determined whether Pine Creek is in the N. W. T., or British Columbia.

AT Pitkarantka, in Finland, magnetic concentrators have been in use several years for the treatment of fine iron ore slimes. The *Wormlandska Annaler* says that the crude ore is pulverized in water in a ball mill that treats thirty to sixty tons of 2-inch ore of medium hardness daily, with a consumption of 15 H. P. The fine powder thus obtained, containing 25 per cent of iron, is brought up to 66 to 68 per cent, while the tailings contain only 1 per cent of iron. The ore powder is molded into bricks without the addition of any foreign material. These are burnt at 800°, and smelted in the blast furnace.

THE crushing capacity of a battery depends largely on the efficiency of the stamp, the character of the ore and the discharging capacity of the mortar. The weight of stamps is a subject on which the final word has not yet been spoken. At the Big Canyon mine, El Dorado Co., Cal., the stamps weigh 1400 pounds each. At the Homestake, S. D., they weigh 850 pounds each and drop 9 inches eighty-five times per minute, developing 78,030 foot-pounds every twenty-four hours, crushing four and one-half tons ore, or one ton for every 17,340 foot-pounds developed. There are 540 stamps dropping at the Homestake.

THE statement that "the \$500,000 appropriation for the building of restraining dams in the hydraulic mining regions of the Sacramento watershed may not suffice for the construction of a single dam," is a little premature, to say the least, and also the additional assertion that "further appropriations must be made before work can begin." There is now appropriated and available the sum of \$500,000, and when the plans of the California Debris Commission have been approved by the Chief of Engineers, and Secretary Alger, the work of excavating and masonry can begin. It is believed the amount on hand will build the required wall or dam at the Narrows in the Yuba river.

AN Act of Congress, approved February 24, 1897, provides that any person who wilfully or maliciously sets fire to timber or underbrush on the public domain, or carelessly leaves fire to burn unattended near any timber, or inflammable material on such domain, shall be deemed guilty of a misdemeanor, and upon conviction thereof, shall be fined not more than \$5000 or be imprisoned not more than two years, or both; and that any person who builds a camp fire, or other fire, in or near any forest, timber, or other inflammable material upon the public domain and fails before breaking camp or leaving said fire to totally extinguish the same, may, upon conviction, be fined not more than \$1000 or be imprisoned not more than one year, or both.

It is estimated that more than half the world's supply of manganese is obtained from Russia, and that Chili ranks next in its production. A. Pourcel in the *Annales des Mines*, describing the manganese deposits of Tschiatour, in the Caucasus, says that the extraction of ore is estimated to cost 8.88 francs per ton, and, adding freights, costs 42.97 per ton at Marseilles, France, excluding the profit of the mine owner and terminal charges. Samples of the ore analyzed gave 55.70, 54.83 and 55.60 per cent of manganese, and 0.18, 0.17 and 0.15 per cent of phosphorus. In Chili the deposits of manganese are mined in the district between Valdivia in the south and Atacama in the north. As a rule the ore yields upwards of 50 per cent of manganese. It contains phosphorus and little silica. In 1888 the production was 25,000 tons, and in 1893 it reached 80,000 tons.

THE report of the State Mining Engineer to the Government of the South African republic for the year ending Dec. 31, 1897, shows that the total nominal capital of the companies engaged in active mining operations on Dec. 31, 1897, was £22,188,225. Twenty-eight gold mines and two coal mines paid dividends during the year amounting to £2,943,831 in the former case and £57,500 in the latter, or about an average of 30 per cent on their issued capital. Calculated upon the issued capital of all the 218 working mines, half of which are still in the state of development and have not yet reached the producing stage, this would give an average of about 5 per cent, which, the report says, may be considered satisfactory. In 1896 the total dividends amounted to £1,793,783. The total expenses for 1897, including direct and indirect State revenue, was £12,005,345. The total gold production for the year represented a value of £11,653,725, an increase of £3,049,904 compared with 1896. The average yield of the ore was 39.79 shillings per ton.

Mines of Kalgoorlie, Australia.

TO THE EDITOR:—With the exception of Butte, Montana, Kalgoorlie is the most prosperous mining town in the world. The gold yield of Kalgoorlie for the month of September, '97, was 39,000 ozs. from 18,000 tons of ore. During the present month the yield will be 25 per cent greater and each succeeding month will see an increase until enough batteries have been erected to keep the stoping at a jump to supply them. At present there are 180 stamps in operation and most of these have been put up in the last six months. The population of Kalgoorlie is now 15,000, most of whom live in tents, humpies and houses of corrugated iron. It is safe to say that in twelve months there will be 40,000 people here, housed in comfortable dwellings. With thirty mines whose reefs will yield over 2 ozs. of gold per ton and average 3 feet in thickness, Kalgoorlie within three years may be producing more gold per month than Johannesburg.

The principal Kalgoorlie mines have an aggregate capital of over £10,000,000 (\$50,000,000), and the dividends paid on this at the rate of 12 per cent per annum. The most important companies are the Lake View Consols, with £250,000 capital (promoters, London and Globe Finance Corporation); Harquahala, with £300,000 (promoters, Mining and Financial Trust Syndicate); Hannan's Proprietary, £500,000; Great Boulder Proprietary, £175,000; Ivanhoe, £500,000; Golden Link, £90,000, and Hannan's Brownhill, £110,000. The best mines are the Harquahala, Golden Link, Lake View Consols, Great Boulder Proprietary, Ivanhoe, Golden Horseshoe, Hannan's Proprietary, Great Boulder Perseverance, Hannan's Associated, Block 45 and North Boulder. The most remarkable crushings have been 3000 tons from Hannan's Brownhill for 24,000 ozs.; Hannan's Associated, 3000 tons for 14,000 ozs.; Great Boulder Proprietary, 40,000 tons for 120,000 ozs.; Lake View Consols, 30,000 tons for 70,000 ozs.; Ivanhoe, 12,000 tons for 25,000 ozs.; North Boulder, 5000 tons for 12,000 ozs.; Great Boulder Perseverance, 10,000 tons for 25,000 ounces; Great Boulder Main Reef, 4000 tons for 12,000 ozs., and Golden Horseshoe (three months' return), 3000 tons for 15,000 ozs. Crushings from these mines never vary. These are figures which will convince anyone of the future of Kalgoorlie.

The Brownhill reef development in the 200-foot level and its fine returns from the bulk trial crushings stamp it as one of the king mines of the field. The main shaft is down 310 feet. In the 60-foot level the reef has been driven on 800 feet north and 500 feet south, and shows gold continuously. All the ore crushed has been taken from the drives here and stoping has not yet been commenced. At the 200-foot level the lode is faulty. Here it is driven on 600 feet south and 300 feet north. The fault was caused by an iron bar, which, on being followed slightly westerly, changed into "gold stone," the crosscutting showing splendid gold. One hundred thousand pounds have been spent on this mine and, notwithstanding faulty machinery, the ore raised has sustained the company. A misunderstanding of the cyanide process handicapped this mine. The cyaniding of a ton of ore has cost £2 8s (\$12), sixteen pounds of cyanide being required, at a price of 2s 6d (60 cents) per pound.

The Ivanhoe, which was recently purchased by Charles Kaufman for £800,000 for the London and Globe Corporation, lies parallel to the Great Boulder. The Ivanhoe ranks third on the field in returns and second to none in probabilities. Three lodes run through the property and the country rock is payable, which is the most remarkable thing about the mine. The crosscutting pays for itself. Most of the ore crushed so far has been raised from the middle lode and has averaged over 2 ozs. per ton. Two hundred tons from the eastern lode have yielded at the rate of over 6 ozs. per ton. At the 100-foot level this lode has been driven on 400 feet and averages 10 feet in width. The middle lode has been driven on 700 feet at the 100-foot level and the reef has an average width of 4 feet 6 inches. The trend is north-west and the formation mullocky quartz. Some stoping has been done on this level of no practical use. The main shaft on the middle lode is now down 300 feet. This is the first shaft that reached 300 feet on the field, and in proving the existence of the lode at that depth put heart into the other companies to sink. The Ivanhoe's previously rich yields have been secured with very little exploratory work, and there is no doubt it has a long life before it. The eastern lode has thrown the middle lode into the shade and given the mine a greater future than ever.

The Lake View is one of the greatest gold mines in the world. It consists of two blocks of twenty-four acres each. At the 100-foot level the reef, which traverses the easterly block from end to end, has been run on to the boundaries of the claim and is worth over 3 ozs. per ton the entire length. At the 200-foot level, or water level, the reef has been driven on to within 100 feet of the end lines, and is of the same value as in the upper level. The lode is talcose schist and the walls diorite. The lode has an average width of 12 feet and stands almost perpen-

dicular, so that the company need have no fear that it will dip through the side line before the 1000-foot level. At the 300-foot the lode has been proven to be equally as rich as above, but it is contracted to an average width of 7 feet and the ore is refractory. Rich shoots of tellurides are being opened up from this level. One shipment of telluride ore has resulted in an average yield of 24 ozs. gold per ton. I think the shipment consisted of 50 tons. Mr. Charles Kaufman secured the Lake View for the London and Globe Finance Corporation, Limited, for £80,000. There are 250,000 shares in the company now, and each share is worth £12. No doubt if Kaufman continues his policy of erecting mills as levels are opened up the shares in this mine, unless doubled, will be worth £50 each inside of three years. Under the supervision of H. C. Callahan, a Colorado man and Kaufman's general manager, the most successful cyanide plant in that part of the world has been erected on the Lake View. By means of this 99½ per cent of the gold contents of the ore is being saved. The regular monthly output of the Lake View is now about 11,000 ozs. About 500 men are employed, at an average wage of £4 per week, on the property. During the present month a dividend of 10 shillings per share has been declared.

The Great Boulder is the central figure in Westralian mining enterprises. Other great mines there are and have been, and are likely to be, but take away the Great Boulder and a serious blank would be left in the Coolgardie gold fields. But, notwithstanding and perhaps because of the greatness of this mine, I must condemn the policy—typically Australian—under which it is guided. With enough ore in sight to keep a 50-head battery going three years, and a lode proven to be as strong and rich at the lowest level (300 feet) as above, the company running the mine are satisfied with the returns of a 20-head mill, without a cyanide auxiliary, although their tailings assay over an ounce per ton, and a neighboring mine has proven how almost perfectly cyanide will work for them. It took the Great Boulder Company a full year before deciding on the addition of the last 10 head to their mill. A year ago the company reckoned on running 50 head as soon as they secured sufficient water, but this they now have and the 50 head are as far off as ever. There has been about five miles of sinking, driving, etc., done on the mine, which consists of eighty-five acres. At the 100-foot level there is a drive 3000 feet along the lode, while at the 200-foot driving has been carried along the lode (800 feet) to the southern boundary and 400 feet north. Dividends are being declared, machinery erected and development work carried on out of the proceeds of the mine.

The Associated Gold Mines are amongst the most valuable on the field and are managed by energy and intelligence in everything. The Australia group, consisting of the Australia, Australia East, Australia South and the Adelaide, is the mainstay of the company. On the Australia a main shaft is being sunk to the 1000-foot level. This shaft is in the center of the main ore body, which is 12 feet wide and of an average value of 3 ozs. per ton. This ore is talcose schistose and in treating it is roasted, broken, crushed in a ball mill, cyanided, and pulverized and amalgamated in a Huntington mill. In the Australia East is another lode 10 feet wide and averaging 3 ozs. gold per ton down to the 200-foot level. At the 300-foot level this lode was proven 14 feet wide and an average assay of 10 ozs. per ton was obtained from the lode where cut. Under the control of N. G. Brookman and James Irwin, whose policy is strictly American, these mines inside a year should have no superior on the fields.

The Kalgurli is a mine whose possibilities are beyond comprehension. Promising but always disappointing in the upper levels, this mine has come to the front in an astonishing manner as depth and settled country were attained. Last December a small vein of telluride no thicker than the blade of a knife was struck in the drive on the middle lode at the 100-foot level. This was followed down and gradually widened out into a magnificent body of ore. There are three parallel lodes at the 100-foot level. In one of them the celebrated jewel chamber was met with, where the ore was so rich that it had to be banked. At the 200-foot level these lodes are each about 17 feet wide and of good value, separated by bands of country carrying gold in small quantities. On the middle lode a winze is being sunk and is now down about 30 feet below the 200-foot level in good ore. So far very little has been done to prove these lodes in length, but there can be little doubt but that they are a continuation of the Australia lode.

The Boulder Perseverance has a lode of sulphide ore of good value, 50 feet wide at the 100-foot level, while splendid developments have recently taken place at the 300-foot.

Other good mines are Hannan's Oroya, Kalgoorlie Mint, Kalgurli, South Kalgurli and the Brookman Brothers' Boulder.

Hannan's Reward is, as the name implies, the pioneer mine of the field. Little is known by the public of this mine, but it was one of the first on the field to prove a gold-bearing lode at a depth of 300 feet. This took place in June last year, yet little or no development has taken place in the mine at this depth. On the upper levels an immense amount of work has

been done and a very large quantity of ore exposed. It is a sad reflection on the management that practically no work of importance has been done in the mine for over twelve months, and it is a sorry sight to see a puny 10-head battery battling away on a property that should by this time have had fifty or sixty heads running. That the ore is of fair value the 1.7 dwt. to 1 oz. returns demonstrate, and the larger the battery the greater would be the profit in treating this so-called low-grade ore.

There are a dozen mines at Kalgoorlie that may reasonably be expected to turn out on an average over 40,000 ozs. per month when fully equipped, or, say, 500,000 ozs. per annum, and more than a dozen more that on present prospects may very reasonably be expected to become regular gold producers, and as developments at a depth in the past twelve months have added so greatly to the value of the field, is it not more than probable that further development will reveal more wealth in this wonderful mineral belt? A remarkable illustration of what may be revealed at depth took place in the Kalgurli, as already told, and away three miles north of the Boulder a development of a somewhat similar nature has recently taken place at the Reefer's Eureka. In this mine, from the surface to a depth of 190 feet, a vein of oxidized ore was followed, fairly rich all the way, but small. At about 190 feet it pinched away and changed into a small vein of sulphides, which in 15 feet of sinking widened out into a nice body of ore from 4 to 5 feet wide, assaying from a few pennyweights up to 5, 6 and 9 ozs. per ton. At this stage it was found necessary for purposes of ventilation to connect the winze with the main shaft, and in driving on the lode it has become poorer in character. There is no doubt, however, that the drive is too high for the better class of stone, as latest assays clearly demonstrate this stone has gone underfoot. That the lode is continuous is proven by the developments in Hannan's North, the south adjoining claim. These developments have stimulated work in the north end of the field.

Many people look askance on the high values placed on Kalgoorlie mines, but when it is realized what has been done in so short a time under great difficulties and poor equipment, and that there is every reason to believe the lodes will be just as valuable in depth as in the shallow levels, then it can be understood that the mines cannot be valued too highly. Nevertheless, it is a question whether the market has gone ahead of the development and equipment of the mines, particularly the latter, or not. As to their ultimate value no one can form a reliable estimate. It is beyond all comprehension and far and away exceeds anything hitherto known in gold mining in Australia, if not in the world. That Kalgoorlie will yet supply the greatest boom ever seen in Australia I have not the slightest doubt, but the time has not yet arrived. Not until the mines generally are turning out the great quantities of gold foreshadowed by the last six months' development will the great boom come. Then Kalgoorlie alone will be turning out more gold than any colony in Australia.

JOHN DWYER

TO PREVENT the engines of a vessel from racing when the screw rises above the water, Sig. E. Putalo has invented an electrical regulator. It consists, according to *Industries and Iron*, of two vessels of mercury, connected at the bottom by a tube, and mounted fore and aft in the ship. The vessels are about half full at normal depth. When the ship pushes forward so as to raise the screw the rods connected with the resistance are submerged one after the other so that an electromagnet is brought into play, the whole resistance being short-circuited when the screw is quite out of the water. The electromagnet operates a throttle valve in the main steam pipe, which is thrown open by another magnet. By this arrangement the steam is turned off and on. From experiments it has been shown that the mercury vessels need not be more than 34 inches apart on a ship 300 feet long.

THE production of phosphorus by means of electrical furnaces in various ways has proved commercially practicable, and is considered an important chemical achievement. One of the methods pursued in this direction, and known as the Ginn & Leleux process, consists in simply heating a mixture of phosphate of lime and coke in a suitable electric furnace, the two ingredients to be first finely powdered, and the mixture is to be completely homogeneous. On the mass becoming pasty under the action of the heat, all the openings of the furnace are hermetically sealed except that for the passage of phosphorus vapor, this being distilled and collected in the usual way. According to another process—the Boublieque—iron phosphide is decomposed by electrolysis, this salt being produced by the simple fusion of phosphates of lime with a salt of iron.

IN waterproof gelatine paper the paper is coated on both sides with a solution consisting of 1 part gelatine, 4 parts water and 1 part glycerine. Coagulate the gelatine and immerse the paper in a solution of 750 c. cm. of formol in 5 liters of water. The paper thus treated is, after drying, impervious even to steam.

History of a Mine.

TO THE EDITOR:—I recently read in a local paper a statement that E. Merrifield, the discoverer of the Merrifield mine at Nevada City, Cal., after making millions out of it died very poor. Merrifield did, some time about 1870, become an owner in and manager of a mine at Nevada City, to which he gave his name. He was not its discoverer. He did not make millions out of it, but he did die poor.

Nearly twenty years before Merrifield saw the mine, Warren B. Ewer of the MINING AND SCIENTIFIC PRESS, T. H. Rolfe, I. J. Rolfe and others owned the mine and erected on it a twelve or sixteen old-fashioned stamp mill. Failing to get returns expected, they brought in on pack mules English fire bricks and built a cupola furnace. At the same time they brought from San Francisco two iron pans or moulds large enough to hold a year's product of the Klondike, in which to catch the melted gold, but they had no use for the moulds. They worked only the surface outcrop and that contained little or none of the precious metal. At this time and for years after the mine was known to all outsiders as the Bunker Hill mine, in consequence of the resemblance of the furnace flue to the monument of that name.

After being idle for several years (and probably abandoned and relocated, of that I am not informed) the property came into the hands of Nelson Soggs, an old sea captain. Soggs ran the mine several years, making some money out of it but not millions. He died leaving only a small estate.

Again the mine was idle for years; the next one to work it is forgotten, but Merrifield did not come upon the stage until about the time mentioned. After Merrifield's day several parties tried the old mine with varying success, until finally it came into the ownership of the Champion Mining Co., which company now owns and operates it, and with their large plant of improved machinery and late methods are reported to be making money.

It is not out of place here to state that Nelson Soggs, on this mine, introduced the first automatic ore concentrators in the State. He had twenty-four of them, called the Bradford vanner. They were small, simply constructed machines and did good work. It was the product of these concentrators that encouraged Maitman & Deetken to perfect and make practical the chlorination process.

JNO. PATTON, 725 Mission St.
San Francisco, Aug. 27th, '98.

The Treatment of Argentiferous Lead.

The extraction of silver from lead has been effected in the past by a process entirely metallurgical in character. The lead was melted with zinc and the molten metals intimately mixed. The silver, owing to its greater affinity for zinc, passed into solution in the latter metal, and the alloy of silver and zinc thus obtained was then distilled to separate the silver from the zinc. A modification of this process, known as the "Rossler Edelmänn" process, differed only in the addition of a small percentage of aluminum to the molten metals. The aluminum combined with the oxygen present as zinc or lead oxide, and in this way produced a better separation of the zinc-silver alloy from the molten lead by increasing the fluidity of all the metals. The electrolytic separation of the zinc from the silver, in the alloy obtained by the Rossler Edelmänn process, was proposed many years ago, and has been repeatedly the subject of experimental trials. The tendency of the zinc to separate at the cathode in spongy form has, however, rendered the electrolytic process unsatisfactory, and though it was introduced at Hoboken, in Holland, and at Lautenthal, in Germany, the latest information from these works is to the effect that the electrolytic parting process has been dropped. Hasse, in a recent article, however, states that the experiment work with an 8 H. P. installation at Friedrichshutte, O. S., has been successful, and that estimates based on the results obtained with the plant show that the process can be worked to yield a large profit. The zinc-silver alloy used contained 10 to 12 per cent silver. It was cast into plates weighing about twenty-five kilogrammes, and was used as anode in a neutral or slightly basic solution of zinc sulphate. Thin plates of rolled zinc were used as cathodes. The deposit of zinc was all that could be desired, when care was taken to keep the electrolyte free from impurities. Spongy zinc at once formed when this condition was not fulfilled. Hasse considers that purity of the electrolyte is the principal factor in obtaining metallic deposits of zinc, and he attributes the success attained at Friedrichshutte largely to the purifying effects upon the electrolyte of a specially designed "cascade," by means of which the liquid passing through the depositing vats was systematically aerated, and the metallic impurities precipitated as oxides. The silver passes into the anode slimes and is recovered by a chemical and metallurgical treatment. As a result of these experiments, Hasse is inclined to doubt whether the electrolytic separation of zinc from its solution can

be made to yield a profit, excepting when dealing with zinc and silver alloys. Pure zinc commands no higher price than ordinary zinc in the metal market, and hence it is the recovered silver which bears the extra costs of the electrolytic treatment. These results, and the opinions based upon them, should receive the careful consideration of all interested as experimenters and investors in the electrolytic processes for the extraction of zinc from its ores.

Alloys of Aluminum.

The industrial alloys may be broadly separated into two kinds: "light" alloys, containing 90 to 99 per cent of aluminum, with 10 to 1 per cent, or even less, of some other metal or metals; and "heavy" alloys, containing 1 to 10 per cent of aluminum, with 99 to 90 per cent of other components. They can, therefore, be regarded as either pure aluminum, strengthened by the addition of some other metal, or as one of the older metals improved physically and chemically by the addition of aluminum.

Light Alloys of Aluminum.—In its purest form aluminum is very soft and not of great service in those arts in which much rigidity and strength are required. For this reason a metal containing only 98.5 to 99.8 per cent of aluminum, the impurities being silica and iron in almost equal proportions, is preferred to metal of 99.6 per cent purity. One casting alloy, having a specific gravity of 2.9, is largely used just now, and is known as "No. 6." Its composition is still kept secret. It has been found to produce remarkably clean castings, which require very little machining to finish up; it takes a high polish, and so far has given complete satisfaction. Another alloy is "No. 4," which contains nothing but aluminum and a small proportion of copper; it is not one of the materials generally recommended, though it has some good qualities. There is a strong suspicion that when aluminum is alloyed with copper galvanic action is set up between the two, especially when the alloy is exposed to salt water; therefore, this is not recommended in any quantity for outside positions. The two alloys particularly recommended, as among the best yet made, are called Wolframium and Romanium. These are both tenary alloys, and next to the aluminum, tungsten is the leading ingredient in each. In one of them copper is present to a small extent, in the other nickel; and both have given astonishing results as regards strength and elongation. Samples of rolled sheet or rods made of these alloys have shown as much as twenty to twenty-two tons tensile strength per square inch, with 5 to 10 per cent elongation in 4 inches, which is remarkable when the low specific gravity of the material is taken into consideration. The above are so-called "light" alloys, that is, alloys containing a preponderating percentage of aluminum with only a small quantity of another metal or metals.

Heavy Alloys of Aluminum.—There are many "heavy" alloys of aluminum, in addition to the well-known bronzes; some of these have not yet reached the development to which their valuable qualities entitle them, and which they will ultimately attain when better appreciated by mechanical engineers. Aluminum bronzes are undoubtedly superior in strength to most of the copper-tin bronzes now in use; and they are especially suitable for marine engineering. Propellers of aluminum bronze have been successfully made for most of the 26 and 30-knot torpedo catchers; also, a large number for the French Government. The two classes of bronze most frequently employed are marked R3 and R4; the difference between them is simply in the proportion of aluminum they contain. The following tests show their maximum, minimum, and mean breaking:

| Mark. | Breaking load, Tons per square inch. | | | Elongation, Per cent in 2 inches. | | |
|-------|---|------|-------|--------------------------------------|-------|-------|
| | Max. | Min. | Mean. | Max. | Min. | Mean. |
| R3 | 43.7 | 39.6 | 41.8 | 13.00 | 6.50 | 9.75 |
| R4 | 39.6 | 39.6 | 34.0 | 35.00 | 15.50 | 23.30 |

Agreeably with which R3 has a guaranteed tensile strength of thirty-five tons per square inch, with 25 per cent elongation in 2 inches; and when cast R4 breaks at forty tons per square inch, with 10 to 12 per cent elongation also in 2 inches. These have the advantages of being considerably cheaper than other bronzes, and are easily employed for any foundry work without special appliances or tools.

ACCORDING to *Electricity*, an interesting fact has come to light regarding the recent explosion of three submarine mines in the Potomac river, which was brought about as was supposed by lightning having struck the switchboard or some of the connections. It now appears that neither the switchboard, cable nor electrical connections show marks of having been struck, and General Wilson, who has been investigating the matter, believes that one of the mines was directly struck by lightning through four feet of water and that the others were probably set off by concussion.

The latest development in field telegraphy and telephony consists in a two-horse wagon equipped with four folding tables, which, when thrown up, forms desks, upon which are placed telephone and telegraph instruments. Batteries are carried be-

neath the seats, while coils of wire are so arranged as to run out as fast as the wagon is driven. Twenty such vehicles have been ordered by the Government.

Is Darwinism True?

W. S. PROSSER.

NUMBER II.

Rabbits in Australia multiplied not from less competition—for there was more—but because the increase was not checked by their natural enemies. When bison roamed the plains in immense herds the Darwinian idea of competition would require us to find most of them in a lean and miserable condition, many degenerating and dying, only those in advance (the strongest) fat. Hunters found no such thing. All—front, middle or rear—were practically the same, and all fat. Take any kind of animal, carnivorous or herbivorous, preyer or preyed on, it is the same story; the increase is limited not by internecine struggle, or a struggle for food, with survival of the stronger, but by agencies entirely foreign, which pay no attention to slight individual differences. The African lions are few in numbers, though for thousands of years scattered over a continent, with unlimited game before them and no superior enemies. So of large and small carnivora everywhere: seldom in large numbers, yet seldom ever seriously diminishing the food supply. Salmon, herrings and many other fishes keep together in great numbers, showing that they feel no such competition as imagined. They find food in plenty, and to spare. Fish are nearly always fat and in good, eatable condition, unless after spawning. If the imagined struggle for food were a fact, it would be common—indeed, the rule—to find fish and game of all kinds in a poor and uneatable state. Fifty thousand shrimps have been caught at one haul, and all good. Mackerel and cod on the Grand Banks have thriven by the million for centuries. Oysters in large beds seem to do as well as in small. The wild denizens of the forest and plain seldom seem to approach the limits of their food. Of nuts, berries, grass, etc., more seems to go to waste than is used. In the Sierras, squirrels eat most of the sugar pine nuts, but of the much greater number of other pine nuts very few. So in the redwoods, and in oak forests—there is a waste. Australia supports tens of millions of sheep and hundreds of millions of rabbits; nearly all of this grass food must have been wasted in old times. California, hundreds of years ago, was covered with wild oats and grasses, thick and high, and nothing, worth mentioning, to eat it. The earth seems to have all the flora it can comfortably support, but not all the fauna. Every few years the grasshoppers prove to us that there is room for several hundred millions more. There may be as many animals on the earth as desirable, but not as many as possible, according to the food supply. Everywhere in wild nature we find the adults well fed and comfortable, and food to spare for many more; and hence that species are limited in numbers not by a struggle for food, and not by slight internal differences, but by powerful outside enemies, to which every considerable difference in speed, etc., of their victims would be of no moment.

This argument is far greater if we remember that according to the evolution theory the differences must have been infinitesimal.

I believe, therefore, that a candid consideration will allow that there are no sufficient grounds for believing that there is, in actual, bona fide operations, any such thing as an evolutionary process by "survival of the fittest" or "natural selection."

Second—As to the introduction of new ideas and novel devices into animal mechanics; some of these separate genera, while others run through whole classes. These inventions were first mental conceptions, and as such could not possibly have originated outside of mentality, and a mentality coupled with knowledge. Their actual embodiment in many intricate and dependent parts cannot have grown up by chance, nor gradually one by one, but must have come into existence as a whole. If a part only, it would have been meaningless and useless, yet natural selection would require that it be made the basis and reason for ages of development along a line, finally leading to a useful result. No less unreasonable is it to invoke the aid of chance to form a device of many parts. Throw a bushel of type into a wagon and drive a few miles over a rocky road. Would they shake themselves into a treatise on geometry? Or would some bits of steel and brass by agitation develop into a watch? Only a directing mind could achieve these results, and only then if that mind had a clear prior idea of intended results. The idea of the tongue and groove in flooring has two parts, yet make but one whole idea, which came into existence as a whole. The wheel, as a means of locomotion, includes the two parts of a circular body and turning on an axis, supporting the load. Neither separately would have been anything. Together they make a wagon wheel. An idea is a complete entity in itself. Other ideas and much knowledge may lead up to it. Other ideas may be added afterwards, but it is one and indivisible—born in a moment, but imperishable.

(To be Continued.)

Hydraulic Illustration of the Wheatstone Bridge.

Although it is undesirable to push the analogy between the electric current and the flow of water too far, or to get the idea of an actual current too firmly established in the student's mind, still a hydraulic illustration is often useful to point out how the results may follow.

To show the action of the Wheatstone bridge by flowing water is usually complicated by the effects of gravity, and illustrates the conditions of pressure rather than those of resistance to flow. Moreover, the question of the galvanometer is a troublesome one, inasmuch as most devices require such a flow of water as to interfere with the bridge effects which it is desired to bring out.

The arrangement described below, says Wm. Hallcock in a recent issue of *Science*, has proved quite satisfactory in showing the simpler resistance effects in the bridge, but especially useful in making clear the effects of capacity and self-induction and how the two may be balanced and compared.

The accompanying sketch is taken from a simple home-made bridge which was constructed as an experiment. Upon a board about 30×50×4 cm. are fastened four glass *T*'s of about 5 mm. inside diameter. Two of these *T*'s have their side projections turned inward and are connected, by short pieces of rubber tubing, to the galvanometer *G*. The other two *T*'s have their side projections turned outward, and these connect by long pieces of tubing with two large aspirator bottles, not shown; *a*, *b*, *R* and *x* are brass strips held under a screw at the

inside end and resting over rubber tubes which can be compressed and closed by the screws *ssss*. These screws are made by soldering a piece of brass about 15×25×1 mm., with corners rounded, into the slot of a common wood screw. Under *R* is a piece of tubing several feet long when self-induction is to be shown; otherwise a short piece is used, like those under *a*, *b* and *x*, just long enough to connect the corresponding *T*'s. *C* is a pint aspirator bottle, with its small side tubulure inserted into the side of the rubber tube. The galvanometer is a *T* of peculiar form, as shown, closed at its top by a rubber tube and plug or pinch cock, as shown at *D*. It is really an electrometer, as it shows difference of pressure (potential) instead of current. In operation the board lies horizontal on a table and the tube *G* is stood up perpendicular so that it becomes a manometer. To start the apparatus fill the large bottle connected with *B* and set it higher than the board, tilt the *A* end of the board up to ten or fifteen degrees, place the *A* bottle lower than the *B* one and open the stop cock (key) *K*. The water will flow through the tubes, driving out the air, and a little manipulation of *D* will bring the water in the manometer to a convenient point. The board is then to be placed horizontal again. By compressing *a* and *b* about equally resistance to flow is introduced into these two arms of the bridge; then compressing *x* will require a corresponding compression of *R* in order to balance the pressure in *G*. It will be readily seen that the qualitative effects can be thus shown, but for quantitative relations it would be necessary to replace the crude compressors by graduated stop cocks. The capacity can be regulated by closing *K*, raising the *A* bottle and taking the cork out of *C*, allowing it to fill more or less and then replacing the cork; the capacity is proportional to the air left in *C*. When *C* is full there is no capacity in *x*. Self-induction is proportional to the length and curvature of the long tube, *II*, under *R*. Self-induction and capacity are shown by a manometer difference in level in the manometer upon opening and closing *K*, the throw (ballistic galvanometer) being in the opposite direction on closing *K* to that upon opening *K*. Changing the levels of *A* and *B* bottles will show that the results are independent of the direction or value of the pressure (electro-motive force). The manometer (galvanometer) may be made more and

more delicate by turning it down more and more nearly horizontal, and by projecting the image of *G* upon a screen its operation may be shown to a large class.

Individual ingenuity will devise many variations and improvements in details and experiments; the fancied merits of the apparatus lie in the galvanometer device and in the elimination of the effects of gravity pressure in the bridge itself, as well perhaps as in the self-induction and capacity elements.

The Fire Resistance of Structural Iron.

As a building material, iron or steel is in many respects far superior to wood. It is true that the former is exposed to destruction by rust, but the visible parts can be kept free from rust by painting them with a suitable material from time to time. The invisible, or rather inaccessible, parts can also be protected in a like manner at the start, but such coats of paint cannot be considered permanent preventives of rust.

Experience has shown that the best protector of structural iron is cement. By exposing pieces of iron which had been embedded in cement for a long time, it was proven that rust cannot assail iron thus protected, provided the cement surrounds the iron on all sides and so that no hollow spaces exist between the latter and the cement coat. Slag cement would not be suitable for the purpose, as it contains acids. The expectations entertained from the application of iron as a fireproof building material have only been partially fulfilled, however. In the beginning it was believed that by the exclusive use of iron in connection with other refractory materials, the problem of erecting actually fireproof buildings had been solved. The destruction by fire of numerous iron and stone buildings, however, which were deemed fireproof, showed that they had no claim to this distinction. They often fell in shortly after the outbreak of the fire. The collapse, as was later ascertained, was due to the fact that the metal parts, then mostly cast or wrought iron, had lost their carrying power. It was recognized from this fact that something had to be done to protect the iron from the direct action of the fire, so as to prevent its loss of carrying power and expansion. That the carrying power of cast and wrought iron decreases at higher temperature was shown as early as 1886, but the city government of Hamburg was the first to have exhaustive tests made, which corresponded in every respect with the conditions met with in a great conflagration. These tests included cast and wrought iron as well as wooden supports.

The supports were placed upright into an iron frame, and hydraulic pressure, amounting to about 15,000 pounds per square inch, put on. For heating the supports a furnace, lined with firebrick and provided with gas burners, was used. The furnace consisted of two parts, arranged on an upright shaft: the two parts could be closed and opened at will. The supports passed through the furnace so that a little space was left between support and top and bottom of furnace, permitting the introduction of air from below and exhausting the gasses of combustion above.

It was shown that unprotected iron supports lost their carrying power in from 17 to 59 minutes, according as the heat was increased faster or slower. Supports filled up with mortar or trellested showed hardly any better results, but proved again the necessity of encasing the supports by a fireproof or non-conducting material. The duties of the latter are to delay the advance of heat to the iron, and to possess sufficient strength to resist the shock of falling debris and the attack of the stream of water thrown by a fire engine. In the subsequent tests the supports were encased in slabs of plaster of paris, xylite or stone-work, asbestos, cement, etc. The results were remarkable. Provided with such casing the iron supports retained their carrying power for as long as 3 hours and 56 minutes. An oaken support without casing withstood a similar pressure in the fire for only 1 hour and 21 minutes. The heat of the flame at which the tests were made ranged between 1100 and 1300 degrees Centigrade.

A "BREATH FIGURE" may be obtained by pressing a coin or like object against a plate of washed glass for a few moments, and then bringing out the image by breathing upon the spot. During the visit of the Czar of Russia to Paris, "magic glasses," showing the Czar's portrait only when breathed upon, were sold in the streets. These were made by applying to the glass for a certain time a rubber stamp moistened with fluorhydrate of ammonia and fluorhydric acid, the glass being so slightly etched by this process that no trace is visible until moistened by the breath.

ASBESTOS LEATHER—the subject of an English patent by a German inventor—is made by dividing asbestos into very fine fibers, immersing and thoroughly coating with a rubber solution, and then evaporating the solvent. The fibers cohere perfectly. The mass may be pressed or rolled into any desired form, and the product is said to resemble leather very closely in peculiarities and structure.

The New Wide Tire California Law.

TO THE EDITOR:—Please inform me the width of tire for a wagon of one ton capacity according to the new California law.—E. A. JENKS, Harris, Humboldt Co., Cal.

The new law, which will go into effect January 1, 1900, does not prescribe tires in terms of weight capacity, but in dimensions of skeins and axles, as follows:

SECTION 1. The width of tires for wheels upon wagons or other vehicles to be used upon public highways of the State of California shall be, for the following styles of wagons, as follows: Two and three-fourth-inch steel or thimble skein axle, 1½-inch tubular steel or iron axle, not less than 3-inch tire; 1½-inch steel or iron axle, 2½-inch tubular or iron axle, not less than 3½-inch tire; 3-inch steel or thimble skein, 1½-inch steel or iron axle, 2½-inch tubular steel or iron axle, not less than 4-inch tire; 3½-inch steel or thimble skein, 1½ or 1½-inch steel or iron axle, 2½-inch tubular steel or iron axle, not less than 4½-inch tire; 3½-inch steel or thimble skein, 2-inch steel or iron axle, 2½-inch tubular steel or iron axle, not less than 5-inch tire; 3½-inch steel or thimble skein, 2½-inch steel or iron axle, 3 or 3½-inch tubular steel or iron axle, not less than 5½-inch tire; 4-inch and larger steel or thimble skein, 2½-inch and larger steel or iron axle, 3½-inch and larger tubular steel or iron axle, not less than 6-inch tire. Other styles of axle shall have tires of same width as those of equal carrying capacity above specified. All intermediate sizes shall have tires of the same width as the next larger size above specified.

To translate these dimensions into weight capacity, has been secured the following table of equivalents from one of the best authorities in the vehicle trade on this coast:

| Size. | Width of tire. | Capacity, pounds |
|---------------------------------|----------------|------------------|
| 2¾-inch steel or thimble skein. | 3 -inch. | 2500 |
| 1½-inch steel. | 3½-inch. | 2500 |
| 2½-inch tubular. | 4 -inch. | 3000 |
| 3 -inch steel skein. | 4½-inch. | 4000 |
| 1½-inch steel. | 5 -inch. | 5000 |
| 2½-inch tubular. | 5½-inch. | 7000 |
| 3½-inch steel skein. | 6 -inch. | 9000 |
| 2 -inch steel. | | |
| 2½-inch tubular. | | |
| 3½-inch steel skein. | | |
| 2½-inch steel. | | |
| 3½-inch tubular. | | |
| 4 -inch and larger steel skein. | | |
| 2½-inch steel. | | |
| 3½-inch tubular. | | |

This would seem to indicate that our correspondent must use a 3-inch tire, as that seems to be the minimum requirement. The law does not state that the law shall only apply to wagons of certain capacity, and there might be a strong question as to whether there is to be any requirement whatever for vehicles only capable of moving less than 2500 pounds.

A European Magnetic Ore Separator.

The Dellvik-Grondal magnetic separator for enriching fine iron ore slime has been employed for some years at Pitkavanta, in Finland. According to the *Wermlandska Annaler*, the raw ore is ground in water by means of a ball mill, which is capable of converting daily, with a force of 15 H. P., from thirty to sixty tons of moderately hard iron ore of about 2-inch gauge into the finest powder. The material appears to be worked with great difficulty; but nevertheless it is enriched from an iron content of about 25 per cent to one of 66 to 68 per cent, while the effluent only contains 1 per cent of iron, not including iron silicate. The separator has the appearance of two rather high drums, or barrels, which in one place are cut off by vertical planes and brought together. In one barrel revolves the separator, consisting of a vertical shaft fitted with cast-iron sheaves placed 2 inches apart, which derive their magnetism—strongest at the upper sheave—from electric winding; and in the second barrel, corresponding with the cast-iron sheaves, small iron plates revolve at the distance of from 1½ to 2 millimeters from the sheaves. The ore, formed into slime by water, runs directly from the ball mill, and trickles off from the upper conical portion of the separator on to its periphery. Particles not containing iron are washed away directly by a further quantity of water, allowed to flow into the separator; while the ore is attracted by the periphery of the sheaves, to which it adheres. The sheaves set up magnetism of the opposite name in the small iron plates of the barrel, owing to which the grains of iron ore leap over and immediately afterwards fall to the bottom, because the magnetism decreases with the distance from the separator sheaves. The iron ore thus obtained in the form of powder is made, without any addition, into briquettes, which are burnt at a temperature of 800 degrees Centigrade and melted in the blast furnace.

THE Denver, Colo., *Daily Mining Record* says: "A commercial test is about to be made in Chicago of a process for converting crude iron ore into the finest steel at one operation without the use of spiegel and manganese or intermediate processes. The inventor—a Toronto, Canada, metallurgist—made the discovery by accident, and as laboratory tests seemed to prove the much-sought-for process a success, he has decided to make a commercial test. A Cripple Creek man is interested in the invention and will furnish the money."

MICROSCOPIC INVESTIGATION is said to prove that the pores of wood invite the passage of moisture in the direction of the timber's growth, but repel it in the opposite direction.

Coast Industrial Notes.

—Los Angeles, Cal., is about to build an \$800,000 hotel.

—Portland, Or., is now credited with a population of 92,375.

—The sugar factory at Alvarado, Cal., started up this week.

—At Union, Oregon, grading was begun last week for the Union, Cornucopia & Eastern R. R.

—Nelson, B. C., has borrowed \$65,000 to spend for an electric light plant and water works.

—At Heppner, Oregon, have been sold this season 475,000 pounds of wool at 12½ cents a pound.

—It is estimated that this season's wheat crop at Pullman, Wash., will reach 600,000 bushels.

—The San Joaquin Valley, Cal., Road's rails are laid to Tulare. The first train arrived Aug. 31st.

—The Napa, Cal., Insane Asylum will build four miles pipe line, costing \$15,000, for an increased water supply.

—In the Marysville, Cal., cannery 450 employees are working fifteen hours a day. The payroll amounts to \$3000 per week.

—To St. Louis, Mo., from Albuquerque, N. M., was shipped last week a train load of wool, 1000 bags, containing 250,000 pounds.

—From Everett, Wash., the steamer Rlojun Maru last week carried 300,000 pounds of lead for the Japanese Government. Over 1,000,000 pounds are yet to be shipped.

—There are now over 2000 men at work on the construction of the Robson-Pentiction branch of the Columbia & Western railway, now building from Robson to Midway, B. C., a distance of 105 miles.

—The Blue Lakes Water Co. of Alpine Co., Cal., propose to put in new dams, clean and enlarge their ditch so that another possible dry season will not find the company without sufficient water to operate all of Amador's interests.

—"The Klondike" and that whole region is a good country for the investment of surplus money that the owner is able to gamble, but it is no country for a poor man or a man who must realize profitably on his investment or be forever ruined.

—The Columbia & Western railway is boring a tunnel near Brooklyn, B. C., 2000 feet above the Columbia river, that will be 3000 feet long, 21 feet high and 16 feet wide. It will require the excavation of 28,000 cubic yards, or \$5,000 tons, of rock. A \$22,000 compressor plant has been installed to do the work.

—A Seattle, Wash., paper asserts that when President Hill of the Great Northern railroad was there he admitted to a reporter that he had been compelled to refuse 60,000 tons of steel rails and 15,000 tons of cotton for Asia, which he might have received had there been a suitable merchant marine on the Pacific coast.

—Standing merchantable timber in western Washington officially figures up as follows:

| Variety— | Feet. |
|--------------|-----------------|
| Pir..... | 66,308,861,000 |
| Spruce..... | 6,403,405,000 |
| Cedar..... | 16,192,276,000 |
| Hemlock..... | 14,699,834,000 |
| Total..... | 103,504,376,000 |

—The California State Fair opens at Sacramento next Monday and continues till the 17th inst. Makers of mining and irrigation machinery find this a good center for exposition of their products, and the fact that the San Francisco Mechanics' Institute will hold no exhibition or fair this year is an additional reason for utilizing space at the State capital exposition.

—W. H. Hammond is at Porterville, Cal., from England, where he went to obtain financial backing for a scheme to develop electrical power in Tulare county. He is making contracts to furnish power for irrigation and other purposes. The plant will be established twenty-nine miles east of Visalia, on the Kaweah river. The estimated cost of putting in the plant and extending the system to Visalia, Tulare, Porterville and Lindsay is \$250,000.

—The Pullman Palace Car Co. is reported to have made the War Department a liberal offer to purchase Fort Russell, Wyoming, with its entire reservation, buildings and water system. The proposal was made as a standing offer to be considered and acted upon by the Government at its pleasure. The object of the company in making the proposal is to establish a great Western repair shop system centrally located between Chicago and the Pacific coast.

—The contract for the construction of the new electric light plant for Healdsburg, Cal., has been awarded to James Stanley of San Francisco, his bid being \$31,643. The California Bridge Co. of San Francisco was awarded the contract for the construction of the municipal water system, its bid being \$31,700. The Oakland, Cal., Bank of Savings' bid of \$32,650 for the bonds to be issued by the city of Healdsburg for the payment of the cost of these plants was accepted.

—Pres. C. H. Foote of the Illinois Steel Works has been visiting San Francisco and other coast points, and in an interview this week is reported as saying: "The great obstacle to the extensive manufacture of steel in California is the scarcity of fuel, of coal suitable for making coke. Steel works would pay well in California. Some of the richest manganese ore I have ever seen has come from this State. There is good iron ore here. We ship a great deal of steel material to the Union Iron Works. It can be delivered here at less cost than the iron ore of this State could be turned into steel here by the use of

imported coal. The absence of fuel is the only obstacle to the extensive making and marketing of steel in California. While I was in the State of Washington on my way to San Francisco I saw some coal mines. There, if any place on this coast, steel might possibly be manufactured. The certainty of an enlarged navy promises well for the steel business."

—Just now, when so much interest is being taken in the possibilities of the Pacific coast as a location for glass factories, the *American Manufacturer* thinks that the following statement recently made by Joseph Engomar, Sr., of Ottawa, Ill., will be of weight. Last year he went to Los Angeles, Cal., to start a flint bottle factory: "I was instructed to go to Los Angeles, Cal., and there build a factory containing two tanks to make flint bottles, if it were feasible to make all ends meet," said Mr. Engomar. "I did not find it so, which was the cause of my return. Figuring on the cost of raw material to make glass with in comparison with the East, I found bottles selling for less on the coast than in our home market, which indicates the coast as a dumping place for Eastern surplus. After producing figures to the Chamber of Commerce and head of the Santa Fe railroad, they informed me they had wondered why they could not have a glass factory on the coast, and that many glass men had been there to investigate, but left as they came. They said that I was the first man who ever produced figures to explain why glass could not be made there, and they were satisfied, and so was I. When you pay more for raw material than in the East, and glass sells for less, there is no business that can prosper. Five large agencies located in Los Angeles supply the wants of the southern coast. F. W. Braun & Co., jobbers in drugs and glass bottles, 401-407 North Main street, Los Angeles, carry alone half a million bottles in stock. This is but one company out of five in Los Angeles. San Francisco is full of similar ones. Towns being greatly scattered along the coast, Pacific railroad rates will eat a man up, to say nothing of raw material and cheap glass."

Personal.

E. DONNELLY becomes Supt. George Washington mine, Sugar Loaf, Colo.

J. R. DE ROJAS, Supt. Texas M. Co., Nevada City, Cal., is in San Francisco.

J. D. TREGLOAN has taken charge of the St. Helena mines, Sonora, Mexico.

B. F. HARTLEY, Supt. Zentgraf mine, Newcastle, Cal., is in San Francisco.

ROBT. WALKER of Salt Lake City becomes Mgr. Omaha M. Co., Mercur, Utah.

W. H. MARTIN, owner Mayflower mine, Nevada City, Cal., is in San Francisco.

CURTIS H. LINDLEY has returned to San Francisco from a visit to Nevada Co., Cal.

P. KERWIN of Virginia City, Nevada, is at the Allison Ranch mine, Grass Valley, Cal.

A. McDONALD, Supt. Kanaka mine, Groveland, Cal., has returned from San Francisco.

O. P. POSEY, Mgr. Cochiti G. M. Co., has returned from Denver, Colo., to Bland, N. M.

J. R. TREGLOAN JR., Supt. South Spring Hill mine, Amador City, Cal., is in San Francisco.

J. A. LIPMAN, Supt. Eaglebird mine, Maybert, Cal., has returned from San Francisco.

E. J. POINGDESTRE, managing owner Johnson mine, Forbestown, Cal., is in San Francisco.

P. WOODS, Gen. Mgr. Eaglebird mine, Maybert, Cal., is in San Francisco for a month's sojourn.

E. C. VOORHEIS, Gen. Mgr. Lincoln mine, Sutter Creek, Cal., has returned from San Francisco.

M. W. MATHER, Supt. Croesus G. M. Co., Moore's Flat, Cal., has returned from San Francisco.

SUPT. BUZZO of the Alice M. Co., Walker-ville, Montana, left for a vacation trip to California.

P. L. SCHUMAN, Supt. North Star Con. mines, Happy Valley, Cal., has returned from San Francisco.

O. O. HOWARD JR. has returned to San Francisco from the Viznaga mine, near Alamo, Lower California.

R. A. F. PENROSE JR. of Prescott, Ariz., has left Salt Lake City, Utah, for the Camas Belt, near Hailey, Idaho.

J. C. WRIGHT of Indianapolis, Ind., principal owner Grand Victory mine, Placerville, Cal., is in San Francisco.

I. A. FOORMAN of San Francisco, secretary M. & C. S. Canal Co. of Calaveras Co., Cal., is at Mokelumne Hill, Cal.

C. E. GRUNSKY, C. E., of San Francisco has returned from a professional trip to the Blue Lakes, Adirondack Co., Cal.

N. D. RIDEOUT, owner Magalia mine, in Butte county, has returned to Marysville, Cal., from San Francisco.

JNO. F. DALY, Secy. and Treas. of the Union Gas Engine Co., is again at his post after a four months siege of typhoid fever.

A. B. FRENZEL of New York is examining a copper property at Kingman, Ariz., whence he will reach San Francisco next week.

C. A. HAMILTON, San Francisco, is in Shasta and Trinity counties, Cal., with several New York capitalists investigating mines.

W. R. CRABBOURNE, Gen. Mgr. Mikado mine, Leadville, Colo., is in San Francisco from the Lindsay mine, Maybert, Cal.

J. EDWARDS of New York City is in San Francisco en route to Mexico to close a deal on a mine for London, England, capitalists.

WM. R. BEALL of San Francisco left this week for London, England, to report to his company on an extensive mining property in

Shasta county, Cal. He expects to return in five weeks.

M. P. BENNETT of Placerville, Cal., Superior Court Judge of El Dorado county, and a mine owner at Garden Valley, Cal., is in San Francisco.

F. T. NILSON, Superior Court Judge of Nevada county and mine owner at Nevada City, Cal., is in San Francisco, en route to Catalina island.

F. H. HALL of San Francisco has returned from Shasta county, Cal., where he has been examining mining properties for a San Francisco capitalist.

J. B. ELDRIDGE of San Francisco has returned from Lower California, where he examined a mining property for a London, England, company.

F. W. BRADLEY, Mgr. Bunker Hill & Sullivan mine, Wardner, Idaho, and the Spanish mine, Washington, Cal., left Salt Lake City for San Francisco.

C. NIGEL STEWART of London, England, is en route to San Francisco on his way to Mexico to conclude negotiations for a mining property for the S. J. T. Co. of Scotland.

F. P. KING, Gen. Mgr. Blue Gravel mine, Yreka, Cal., owned by the Colorado Exploration Co., has returned from San Francisco, where he bought mining machinery.

CHAS. BUTTERS is at Salt Lake City, Utah, giving attention to the experimental metallurgical plant he is erecting there. He expects to return to San Francisco after thirty days.

EDWARD N. LINDSAY has gone to San Diego Co., Cal., to examine some copper and gold prospects. If the weather is not too warm, he expects to visit the Colorado desert before his return.

C. D. LANE, who has large mining interests on the Pacific coast and in Nevada, Arizona and Mexico, writes from Kotzebue sound that he expects to reach San Francisco the middle of October.

BERTRAM HUNT, late local Mgr. for the MacArthur-Forrest cyanide process, left for western Australia, via New York, last Thursday, to assume charge of the property of the Eureka G. M. Co., Ltd.

THOS. CLARK, managing owner Landecker mine, El Dorado, Cal., and Pres. El Dorado County Miners' Association, has returned from San Francisco and Pacific Grove to Placerville, Cal.

F. LEONARD, Pres. of the Comstock Tunnel Co., has gone to New York. The meeting of the stockholders will be on Oct. 1st. Among other propositions, will be one to drain the mines of Silver City through an extension.

R. M. ECKART JR., Asst. Mgr. Allison Ranch mine, Grass Valley, Cal., is expected home to-day from Honolulu, where he has been superintending the installation of Riedler pumps on several sugar plantations.

MAJOR WALSH, the retiring gold commissioner of the Yukon, is back again from Dawson. He says the Klondike is "all right," but that people going to that region should "scatter out" and not all go to Dawson. He estimates this season's gold output at \$11,000,000. Major Walsh is on his way to Ottawa, to report, where he says he will recommend that Parliament clear the White Horse rapids and Thirty-mile river of the rocks that have done so much damage this year. He also recommends a telegraph line from Dawson to the provinces, and thinks one will be constructed before the year closes. He believes that Dawson will be a permanent camp.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

RETORT OIL BURNER.—G. H. Larkin, San Francisco, Cal. No. 609,552. Dated Aug. 23, 1898. This invention relates to an apparatus which is especially designed for the combustion of crude or other oil as a fuel. It consists essentially of a vaporizing chamber or retort, a means for supplying and delivering oil thereto, a surrounding superheating chamber with means for supplying steam to this chamber surrounding the oil vaporizing retort, means for finally delivering the steam to mingle with the vaporized oil and in a novel construction of the apparatus and in a means for supplying various burner tips through which oil and steam are discharged into the combustion chamber.

AUTOMATIC PRESSURE EQUALIZING BEER FAUCET.—C. R. Martin and L. A. Spinelli, San Jose, Cal. No. 609,554. Dated Aug. 23, 1898. The object of this invention is to provide a faucet by which beer or other effervescent liquid may be drawn in a comparatively solid condition and without a great mass of foam or froth caused by the escape of gas from the liquid when the pressure is relieved and to so regulate the pressure by an automatic operating mechanism that the gas pressure can be retained within the cask or receptacle until the liquid has all been withdrawn while the reduced pressure is maintained in connection with the drawing faucet. It consists of an expansion chamber having at one end a draw-off faucet and at the opposite end an inlet passage connecting with the cask or source of supply. Within the expansion chamber is a float, and a valve controlled by the rise and fall of the float serves to close or open the inlet passage so as to keep a supply of liquid within this chamber. An elongated tapering valve closes outwardly upon a corresponding seat and a spring serves in conjunction with the pressure within the cask to keep this valve closed. When connection is made between the part containing this valve and the expansion chamber this tapering valve is

forced backwardly from its seat and leaves a narrow channel around itself through which the liquid flows and passes thence into the expansion chamber, the pressure being thus regulated so that, while it maintains the beer or other liquid in a perfectly sharp condition, it prevents too great an escape of gas with the liquid.

ADJUSTABLE HYDRAULIC NOZZLE.—A. B. Eastwood, Newcastle, Cal. No. 609,578. Dated Aug. 23, 1898. This invention is designed as an attachment for hydraulic nozzles to which water is brought under a high head, these nozzles serving to direct the water into the buckets or wheels which are driven by its momentum. It is often necessary to vary the power of the wheel and regulate it to the load which is to be lifted, and by reducing the jet of water as the power required is diminished a considerable saving of water results. The device consists of a transversely movable slide having a line of nozzles of varying diameter projecting from one side, a casing within which said slide is movable having a slotted cover through which the nozzles project on one side, while the supply pipe connects with the opposite side, and a means connecting with the slide enables the operator to move it instantly so as to bring either one of the nozzles in line with the supply pipe.

REVERSIBLE DISK HARROW.—C. T. Settle, San Jose. No. 609,560. Dated Aug. 23, 1898. The object of this invention is to provide an apparatus for a more thorough and complete cultivation of land, and especially the working of land between rows of trees beneath projecting branches thereof and in other places outside of the line of travel of the team. It consists essentially of a main frame having supplemental extension bars adjustably attached transversely thereto, vertical boxes adjustably fixed to the ends of the extension frame and revolvable disks mounted in groups upon axes which are journaled in the lower ends of standards turnable in vertical boxes so that the disks may be adjusted with relation thereto. A horizontal shaft is journaled transversely upon the bed of the machine with crank arms at the ends and rods connecting the crank arms with the ends of the swivel beam, and by means of an actuating lever and pawl and rack mechanism the shaft may be turned and locked at any desired point.

VOTING MACHINE.—Salomon Ducas, San Francisco, Cal. No. 609,576. Dated Aug. 23, 1898. This invention relates to mechanical voting machines, and its object is to so construct the apparatus that it may be easily changed or altered to accommodate it for use at elections, in which different numbers of candidates are to be voted for while at the same time maintaining a simple, cheap and effective apparatus. Within the frame or casing are a series of pins which correspond with the names of the different candidates, and which, when operated, would cast a vote for the particular candidate, and with these are a means to prevent the operation of more than one of said pins for a single candidate or the operation of any one pin more than one time by a single vote. These voting pins carry type, and paper strips are arranged to move under the types with reels upon which the strips are carried so that each vote is imprinted and properly recorded. In connection with this is a mechanism by which straight party ballots may be voted without going through the operation of voting for each particular candidate.

FOLDING TENT.—A. B. Lloyd, San Francisco, Cal. No. 609,553. Dated Aug. 23, 1898. The object of this invention is to provide an easily transportable shelter tent combining in one structure the covering material and extending framework, the whole being so arranged and connected that it may be folded into a very small compass for transportation. The framework consists of rods pivoted at one end to common center pieces, which are separated transversely to a distance equal to the desired width of tent. These rods radiate outwardly and each pair is connected by transverse bars with transversely jointed hinges. Over these bars is fitted a covering which is attached to the side and transverse bars so that it may be extended or folded in unison with these bars and the whole packed when required into small dimensions for transportation. The covering material may have side and end flaps extending inwardly when the device is set up and the mattress or bed lying upon these inwardly projecting flaps will hold the contrivance firmly in place. Openings are made in the side and an open-mesh fabric inserted which serves for ventilating purposes.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey, Strong & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR THE WEEK ENDING AUGUST 23, 1898.

609,576.—VOTING MACHINE.—Ducas, S. F.
609,578.—HYDRAULIC NOZZLE.—A. B. Eastwood, Newcastle, Cal.
609,580.—CHART TABLE.—Greenleaf & Barker, Hoquiam, Wash.
609,582.—RETORT OIL BURNER.—G. H. Larkin, S. F.
609,583.—FOLDING TENT.—A. D. Lloyd, S. F.
609,581.—RAZOR SHARPENER.—A. C. Mack, Portland, Or.
609,554.—BEER FAUCET.—Martin & Spinelli, San Jose, Cal.
609,595.—FRUIT PRESS.—J. R. McKee, Bardsdale, Cal.
609,580.—DISK HARROW.—C. T. Settle, San Jose, Cal.

609,721.—FAUCET.—W. Zoller, S. F.

NOTE.—Plain and Certified Copies of U. S. and Foreign patents obtained by Dewey, Strong & Co., by mail or telegraphic order. American and Foreign patents secured, and general patent business transacted with perfect security, at reasonable rates, and in the shortest possible time.

A 2000 I. H. P. Triple-Expansion Mill Engine.

A new set of triple-expansion mill engines for driving an extension of the mills of the Belfast Ropework Co., Ltd., is of sufficient mechanical interest to warrant illustration and description. This company is said to own the largest rope and twine works in the world; the extension just completed covers an area of eleven acres, and is capable of producing 150 tons of twine per week.

The illustration shows the engines to be of the inverted triple-expansion type. The cylinders are 24", 38" and 50" in diameter respectively, the stroke being 24". All the cylinders are bolted together above the tops of the supporting columns, forming a rigid arrangement and securing great steadiness on the upper platform. The receivers are arranged between the cylinders with the steam and exhaust valves directly connected, avoiding all connecting pipes. The valves are arranged at right angles to the center line of the engine, thus permitting the withdrawal of any valve by simply removing the back covers, leaving all the other gearing intact. The steam valves are actuated by a cut off motion, the high-pressure being automatically controlled by the governor, while the mean-pressure and low-pressure are adjusted by hand while the engine is running. Metallic packing is fitted to the piston rods and valve spindles. The cylinders are supported on six cast-iron columns, three of which form the guides and support the rocking levers for the valve motions. The eccentric rods are carried diagonally to the front of the engine directly under the vertical rods, to the cut-off gear and valves, thus avoiding undue strain on the center pins and giving great accessibility to the working parts. The bedplate is of massive design, and is made in three sections, each carrying two of the columns. The crankshaft bearings (six in number) are lined with white metal, provided with vertical adjustment, while special provision is made for removing the brasses whenever necessary. The crankshaft (15" in diameter) is of the built-up type, being made of twelve parts, all the parts having been bored right through, so as to ensure soundness of the forgings. The fly-wheel shaft is coupled to the end of the crankshaft in the usual manner, having bearings 16" and 36" on each side of the flywheel, also lined with white metal. The flywheel is 20 feet in diameter and is made in four segments, each weighing about thirteen tons and arranged as two wheels in halves side by side. The wheel is grooved for forty-two 1½" ropes, and is hooped at the bosses and keyed on the shaft by four keys. The total weight of the wheel alone is about fifty tons.

The air and circulating pumps are at the back of the engines, being worked by rocking levers of low-pressure and high-pressure engines respectively. The air pump is single-acting, 30" in diameter by 18" stroke, with feed pumps 4" in diameter and 18" stroke, arranged on each side. The circulating pump is double acting, 30" by 18", drawing from a reservoir and discharging through the condenser, either back to the reservoir or direct to the river. The surface condenser placed outside of the engine-room is of circular form, having 4500 square feet of cooling surface, with brass tubes and plates. A special arrangement is provided for working jet condensing, if required, which can be resorted to without delay.

A special design of double-cylinder barring engine is provided, working into teeth on the rim of the flywheel, and this automatically throws itself out of gear when the main engine starts. The steam pipes are of wrought steel, and fitted with a water catcher. The stop valve on the engine has been fitted with an electrical stop motion, operated from various parts of the works, as a special safeguard, in addition to the knock-off valve. A supplementary governor is also fitted, which, combined with the main governor, ensures very steady driving.

In the boiler house are six boilers,

made by the same company, for a working pressure of 300 pounds. These are of the two-flued type, 8' diameter by 30' long, each weighing about thirty-five tons, including fittings. The flues are 3' 2" in diameter. The shell of each boiler is made in six rings of plates to the length of the boiler, each ring being in one plate, having the longitudinal seams made with double butt straps. These are treble-riveted, six rows of rivets in each strap, giving a high percentage of strength to the joint. The circular seams are double-riveted lap joints.

The front end plates are attached to the shell by an external steel angle welded into a solid ring, and double-riveted to the shell and end plate. The back end plates are flanged inwards to connect to the shell and are attached by a double row of rivets. Both end plates are very substantially stayed by diagonal plate stays, attached to double steel angles on shell and plates by a double row of rivets in each angle, due

by a rattlesnake, take a sharp knife and cut through the fang wounds just deep enough to make it bleed, then take some mud and make a dam around the wound, break a cartridge and pour some of the powder on the wound, then touch it off with a match and the explosion burns the poison and kills its effect. If there is no mud convenient or water to make it, put on the powder and fire it all the same. The mud dam is simply to confine the powder so that it will not burn a larger space than is necessary."

WARNINGS by sound to vessels in fog are unreliable on account of the curiously uncertain effects of air currents, which often render inaudible the signals of nearby foghorns, while distant sounds are plainly heard. To detect approach to danger with greater certainty, H. Herberts, of Newark, N. J., proposes the use of the thermopile. This apparatus is capable of registering a change of temperature as small

A 2000 I. H. P. TRIPLE-EXPANSION MILL ENGINE.

provision being left round furnace openings on the plates for the expansion of the flues. Each flue is composed of sixteen steel rings, formed of plates bent truly to a circle and welded along the length, and then flanged to connect to each other, a flat bar being inserted between the flanges for caulking, thus ensuring the rivets being kept out of the fire and providing an expansion joint. All the edges of the flue rings are turned up by machinery. The flues are attached to the front end plate by an end plate having openings flanged outwards to suit the external diameter of the flues, and at the back ends by similar flanged openings, the flanges, however, projecting inwards. Each flue is fitted with five parallel cross tubes, each being made from a single steel plate rolled to a circle and welded along its length, and afterwards welded into flue rings, thus dispensing with any riveted joints. Wrought steel stand pipes are riveted on the boilers to take all mountings, while the man-hole openings in the top of the shell and the bottom of the front end plate are provided with wrought steel compensating rings, having faced joints to receive stamped steel doors.

THE following cure for rattlesnake bites is guaranteed by a U. S. Army surgeon in Arizona, who says it never fails if used in time: "When bitten

as a millionth of a centigrade degree, detecting the heat of a candle at a distance of a quarter of a mile; and by using two horizontally rotated thermopiles, the two heat-collecting funnels pointing in opposite directions, it is believed that not only would the proximity of a vessel be shown by its heat radiations, but nearness of an iceberg, and even of land or a sunken wreck, which would be indicated by the same laws of radiation.

DUODECAPLEX telegraphy has been receiving the attention of M. Mercadier, a French electrician, for many years. In experiments now being made on the Paris Bordeaux line, twelve Morse transmitters are worked simultaneously on a single wire, each sending its signals to the proper receiver at the end of the line. This result is attained by means of interrupted currents. Each transmitter receives its current through an electrically vibrated tuning fork, whose vibrations are of the period necessary to cause resonance in the proper receiving circuit, which has its self-indication and capacity correspondingly adjusted. The receiver, called a monotelephone, is also acoustically adapted for damping out undesired signals, the combination effecting so complete a sifting that only a slight and not troublesome murmur comes from the unintended signals.

Riveted Pipe Steel.

At the recent Detroit meeting of the American Society of Civil Engineers, President Fteley in his annual address reviewed the work of the past year in different branches of the engineering profession. Concerning steel pipe construction he said: "Construction has been favored by the decreasing price of iron and steel. The price of cast iron pipes, especially, has never been so low as it is at present. Steel riveted pipes, for the conveyance of water from the source of supply to the point of consumption, in recent years, have been introduced more liberally in the East. For long distances, with large diameters, under heavy water pressure, especially when few connections have to be used on the way, these pipes are as much superior to cast iron pipes as the steel substitute is to the old cast iron tension member of a bridge and it is not doubted that they will be ultimately used to the exclusion of others, but, unfortunately, although similar pipes made of wrought iron have been successfully used for years on the Pacific coast and elsewhere, it cannot be said that the coatings used to preserve the metal from oxidation are entirely satisfactory.

"The rivets used for fastening the pipes and the tapping joints impede the flow to a certain extent, and a pipe has been devised the fastenings of which are entirely outside and provide the pipe with a smooth bore. The great improvement in steel welded pipes of large diameter will also remedy that defect to a large extent. An order is reported of several thousand tons of welded pipes to be made of Siemens-Martin mild steel, 24 feet long and 42 inches in diameter, for the Birmingham Water Works. The possibilities of steel pipes are well illustrated by the proposition to convey a much-needed supply of water of 5,000,000 gallons per day, to a mining district of Western Australia by means of a pipe 30 inches in diameter and 328 miles long."

THE stability of the solar system, demonstrated by Laplace from Newton's law of attraction, is shown by M. H. Poincare to be a mistaken inference, overlooking the modern conception of energy. Everywhere energy is being dissipated, work taking the form of heat, and instability is the law of all natural phenomena. Even the heavenly bodies do not escape the law tending toward final repose. Their energy is being slowly dissipated through the friction of the tides, and we are approaching a state in which the sun, the satellites and planets will all revolve with the same speed about a common axis. The condition cannot be permanent. Even if there is no resisting medium in space, the planets' magnetism will continue to have a retarding effect, and in the end all planets will fall to the sun.

A COMPILATION by the *Scientific American* shows that at the present time the various maritime powers of the world possess about fifty first-class armored cruisers, either completed or under construction. England has eleven of these swift and formidable crafts built and building. France has fourteen. Spain has nine. The United States has precisely two. We are far behind other nations in war vessels combining the speed of racing cruisers with ample armor protection and heavy batteries. These vessels have a function all their own in warfare. Their place can never be taken by sixteen-knot battleships.

EVEN seasoned floors will sometimes open at the joints, making ugly cracks, harboring dust and disease germs, besides admitting more air, etc., than is desirable. A ready and cheap way of filling these openings is to cut up and shred a large quantity of old letters, newspapers, etc., and pile them into a large pot with water, adding a handful of gum arabic to each quart of mixture, and let the whole simmer to the consistency of thick cream. While hot, fill up the cracks, pressing same down, and finish smoothly. When cold, it as hard and tough as the wood flooring itself and ready for a coat of floor paint.

Mining Summary.

ALASKA.

The first consignment of gold dust from the new Pine Creek district has arrived—300 ounces. The gold is a bright yellow, similar to the Little Manook gold, and free from silver and rust found in Klondike gold.

Another stampede is reported to the Hoota-linqua, and from \$20 to \$40 per day to the man is what the pay dirt is said to be running. Many have already left Glenora and Telegraph creeks for the new diggings, and more will follow as soon as provisions can be rushed over to the Teslin.

More finds are also reported from the Stokene. William Reed of Chicago, owner of the discovery claim of the placer find made on the river, has returned to Wrangell. He says his claims are worth from \$5 to \$8 a day to the man.

Pres. P. B. Weare of the North American Transportation and Trading Co. has had a special investigation made this summer of the coal deposits on the Tanana and Yukon rivers and the copper ledges on the Koyukuk river. He brought down rich specimens of both ores and pronounces the Koyukuk copper samples to be the finest he has ever seen. Weare says mines of both minerals will soon be developed on the Yukon, with every prospect of great profit.

A recent report was published in many papers that 3000 Americans were starving on the Teslin trail, between Telegraph creek and Teslin lake. The U. S. Government asked the Canadian Government to investigate the matter. This has been done and a report received saying only 1500 people altogether are on the trail and that they are well supplied with provisions.

The steamer Roanoke arrived at Seattle, Wash., Aug. 30th, from St. Michael, Alaska, with 458 passengers and about \$1,000,000 in gold dust. Most of the passengers were men who went to Dawson in last year's rush. They have no gold, but lots of experience. The fortunate passengers numbered about seventy-five. Of these probably twenty-five had over \$1,000 each. The amounts held by the remaining fifty ran from \$500 to \$5000.

ARIZONA.

Progress is satisfactory at the Table mountain, Pima county, copper camp. There is said to be about 150,000 tons of ore on the dump, including 20,000 tons of high grade. A large stamp mill will be erected there shortly. —E. E. Greenwood worked twenty-two tons of ore from the Sunrise at Placitas, from which the returns were seventy-nine ounces in gold, or an average of \$50 per ton. —Work on the Planet-Saturn mine in Fool's gulch, Yavapai county, which was suspended on account of the flooding of the mines, will soon be resumed. —The plant of the Mammoth G. M. Co. at Mammoth is in operation on 200 tons of tailings. There are twenty men employed. Fifty stamps are dropping.

It is said that three new steam hoists will be erected on mines at Chloride, Mohave county, this fall. —The new furnace of the United Globe mines was blown in recently and is making a good output of copper. —The Chicago mill at the Jeff Davis ranch has started on 250 tons of ore from the Jersey Lily mine. —F. Nagel cleaned up gold bullion weighing seventy-nine ounces from thirty-two tons of ore from his Sunrise mine, at Placitas. —The Storm Cloud mill in Yavapai county is crushing \$25 rock from the Storm Cloud mine. —Development at the Elkhardt mine in Mohave county is going forward. Water has been struck in the mine in sufficient quantities to run the concentrator ten hours a day. It is proposed to sink the shaft 500 feet. —Business at the sampling works at Tucson is resumed by C. B. Wores.

Yuma Sun: The smelter at Kingman has reduced its rates to \$5.50 per ton for ores which run under \$50 per ton, and \$7 for ores running higher. —Ore from the Gunboat mine near Peoria, Maricopa county, will be reduced by the cyanide method. About a three-ton plant will be erected to start with. —The output of Mohave county's mines is computed to be \$200,000 per month. —Considerable ore is being taken out of the Loudon-Galley group of mines, in the Whetstone mountains, Cochise county. O. B. Hardy, of Nogales, has a bond on the property. —From the Prince Albert mine, of White Hills, two tons of ore smelted ran 1600 ounces silver and an ounce gold to the ton. The balance of a shipment went 200 ounces silver and half an ounce gold. —A small cyanide plant is being erected at Fortuna, and experiments being made to determine what is needed to reduce the immense pile of tailings which has accumulated from the 20-stamp mill. It is estimated that the tailings contain in the neighborhood of \$750,000. —Some time between September 10th and 20th smelting will be resumed of the ores of the Old Dominion Copper Co.'s mines at Globe. A large force has for six weeks been making repairs and improvements at the smelter and hoisting works.

The increased business of chloriding in the mining districts contiguous to Tucson, is evidenced by the ore received daily at the sampling works. —The West Oro Bonita mine, in Tiger district, is said to be showing well. A tunnel driven on the vein nearly 200 feet exposes an ore streak of \$40 gold rock 2 feet in width.

CALIFORNIA.

Amador.

Republican: At Jackson the Zella mine is being worked to a great extent in the 1000-foot level. The shaft is continued deeper. About one-half the usual force is employed. —The scarcity of water has not affected the Argonaut mine. Work is going on as usual, and it is very likely to continue, as it has secured the first right of water by getting a twenty years' lease on it. —Work at the Amelia

mine is progressing. The shaft is down 750 feet. —Supt. Truscott of the Oneida says that the result of the mill test made at the Zella was encouraging. Since drifting commenced on the ledge he has run 1000 feet, and the ore tested was taken from these drifts, without stopes or upraise. On the north end a body of ore about 300 feet in length and varying in thickness from 3 to 30 feet has been found, and, although its grade is not high, it is fair, and sinking will be commenced soon. —The Central Eureka at Sutter Creek is experiencing some financial trouble. The shaft is down 1150 feet and a good ledge is reported.

Dispatch: At the Amador gold mine sinking continues. Supt. Dye thinks there will be no occasion for a shut-down. He is putting the shaft down as rapidly as circumstances will permit. No drifting is being done, so the mill is not running. The shaft is down 1075 feet and the rock continues hard. It is the intention to sink the shaft to a depth of 1500 feet before drifting again.

Butte.

On Butte creek near Chico Marsh & Co. are taking out from \$40 to \$60 a day, working four men.

The Oroville Register says that the Banner mine, which has been idle part of the summer, has put on seventy-five men, part of whom are bringing in water from Cherokee and others taking out quartz. —Owing to the low stage of water in the several branches of the Feather river new mining claims have been opened up, many of which paid fair profits. —At the R. M. mine near Buckeye the tunnel has reached 165 feet, running on the ledge. A mill run yielded \$15 a ton, exclusive of sulphurates.

Calaveras.

The drouth has occasioned cessation of work in nearly all of the principal mines. Water is a scarce commodity. It is sold in Valley Spring by the bucket.

Work is active in the Lightner mine, near Angels. The mill is running night and day, and the ore is good grade.

Chronicle: The Machu mine at West Point will be unwatered and resume operations shortly under the superintendence of R. Wilkins.

Prospect: The Lightner mine will run their plant by electricity. The California Exploration Co. have begun to set poles to run their wires into Angels.

The Mokelumne & Campo Seco canal is being cleaned and enlarged. The canal is being made a foot wider. It is estimated when completed it will carry 2000 inches of water. About fifty men are employed.

El Dorado.

(Special Correspondence). —The domestic troubles of the old Strable Slate Co. at Kelsey have been adjusted and work will resume within a few weeks. The property has been idle nearly four years. The new company has incorporated with a capital of \$50,000 and is composed of San Francisco men. There are 360 acres in this quarry and the slate is of superior quality.

Kelsey, Aug. 30th, '98.

(Special Correspondence). —The leasers of the Hill Ranch mine near El Dorado are meeting with success in the development of the property. A ledge of high-grade ore has been found which far exceeds in its output the cost of machinery and development of the mine.

There has not been at any time in the history of the county such thorough and extensive prospecting done as is going on in all parts at this writing. The shortness of water has had a beneficial tendency in this respect and the outcome will be of advantage.

The miners in the American river bed are meeting with good success. There are about 150 men working between Coloma and Kelsey, a distance of seven miles.

Placerville, Aug. 29th, '98.

Nugget: Notwithstanding the drouth, a great deal of development work is being done in the county. —At the Rose Kimberly they are drifting on the ledge on the 200 level. —It is said that the Jasper Con. has been bonded to a San Francisco company and that development work is to be resumed at once. The Jasper has been idle for a year. —At the Boulder they are drifting on the ledge in the lowest tunnel. An air compressor is being installed for three drills. A 20 H. P. engine is also being added. Ten stamps are to be added immediately to the 10-stamp mill. —At the Houx mine near Rescue they are cross-cutting on the 100-foot level. —Hayward & Lane are developing the Boneset under bond. The tunnel has been driven in on a 4-foot ledge 120 feet. —Unwatering the Pine Hill G. & S. Co.'s property near Granite Hill is under way and development work will soon be resumed. J. Eddy of Grass Valley has been appointed Supt. —In Weber creek district the Japanese is having a test crushing of fifty tons made. —Raymond & Tanner have bought the Sampson quartz mine near Diamond. —Kipp Bros. discovered a pocket while digging a well on their place in Jay Hawk from which they have taken over \$3000.

Kern.

The Eureka mill at Johannesburg is running on ore from the Kinyon mine. The tanks for the cyanide plant will soon be completed.

A ledge running from 12 to 14 feet in width is reported discovered in the Rebecca mine near Randsburg. The ore is said to horn well and shows specimens of free milling gold. —A strike is reported in the Buckboard mine in the Stringer district, Randsburg. The owners of this mine have worked steadily on it for eighteen months. —The Little Butte mine is said to be keeping well up to the expectations of its owners. Some rich ore is being taken out 300 feet from the surface. —At the Windy claim, owned by J. Singleton, Pres. of the Yellow Aster M. Co., the shaft has been enlarged and made a double-com-

partment shaft. They are now sinking a second shaft on the property.

A strike is reported in the Blackhawk mine of a ledge from 12 to 14 inches wide. It is estimated that the ore will run from \$300 to \$400 per ton. The gold saved from the hornings amounted to several dollars the first day. Beginning the first of the next month they will have a mill run made at the Johannesburg Reduction Works.

Mono.

Last week's Standard Mill statement reports ore crushed for the week, 206 tons; average assay vanner tailings, \$9.85; concentrates produced, 2 tons; assay value, \$196.95; amalgam produced, 1089 $\frac{1}{2}$ ounces; value per ounce, \$2.81. Tailings plant No. 1 treated 299 $\frac{1}{2}$ tons tailings for the past week. Plant No. 2 is still in course of construction.

Nevada.

(Special Correspondence). —The Washington district of this county, which years ago had several productive mines, none of which were worked to any great depth, is again becoming the scene of resumption of work on these same properties.

The Eaglebird mine at Maybird is a fair illustration of success, showing that the mine was not exhausted of its treasure.

Work on the Ormonde has also shown that early work had not been to the last depth of the paying portion of the property.

The prospecting of the old Lindsay mine by a St. Louis company that has acquired wealth in the mines of Leadville will be thorough and will show what remains in this long abandoned mine, which yielded well in earlier years of its history.

The Gaston Ridge near Graniteville, abandoned at 400 feet, in which a 2000-foot tunnel has since been run, cut the ledge at nearly 700 feet depth, and the milling capacity of the ten stamps has been doubled.

The German mine near Washington, which for several years sought a market, is not for sale now, but work will be pushed by the company to ascertain its worth.

The St. Patrick mines, a large low-grade property, are receiving attention, and further development will be pushed.

The formation from Washington toward Maybert for three miles is slate, and then changes to granite.

Preparations are being made in this section to guard against possible future contingencies in power, and another year, judging from present indications, will see the mining properties of this section well advanced in their work, and among these named two will be dividend-paying in their output.

Washington, Aug. 29th, '98.

The shaft at the Odin mine, near Nevada City, is nearly 100 feet deep. It is expected to reach gravel at 500 feet.

The Champion M. Co. has finished the new dam and the reservoir is being filled with water. This will enable the company to run both mills and all the seventy stamps, a portion of which have been hung up because of a breakage at the reservoir. The dividends which have been passed for several months and that for several years had been of a regular monthly occurrence will soon again be a feature in the company's workings. —The Nevada County Electric Power Co. will build an independent line from the power house to Grass Valley, a distance of nearly eight miles.

At the W. Y. O. D. mine, Grass Valley, overhauling the mill, retimbering the shaft, and putting the machinery in first-class order has been finished, and the full complement of men will be put to work by Supt. Simmonds without delay. —Some rich ore, such as used to come out of the mine in former days, was struck in the Phoenix recently. —Maroney & Webb, at French Corral, have bonded the Slide quartz mine, and work will soon begin for developing the property.

Union: M. Von Reichbach, Supt. Golden Gate mine, near Grass Valley, at a depth of 350 feet has found a ledge which averages over 1 foot wide. The company operating the property will next month commence the erection of a 5-stamp mill, which will be run by electricity. —D. Voss, who took a bond on the Lecompton mine, near Nevada City, has found good ore which gives indication of permanency. The ledge is from 2 to 12 inches in width, free milling and heavily mineralized.

Placer.

Herald: At the Cash Rock mine on the American river, near Forest Hill, Supt. Waterhouse has two shifts at work and expects to reach bedrock in a few days. They have found pay dirt and look for a good body of pay gravel when the bed of the river has been reached. Owing to the great scarcity of water in the mountains this has been a favorable season for river mining. Mr. Waterhouse is employing 150 men at the Cash Rock. —Supt. McAulay is working twenty men at the old Mayflower mine. —Grenell & Roush, lessees of the Breeces & Wheeler claim at Bath, are employing thirty men and the mine is reported paying. —Ten men are employed at the Spanish Queen mine near Forest Hill.

Leader: The boundaries of the Golden Rule mine have been established by a survey, and at an early date improvements will be made on the property, which is an extension of the Zentgraf mine, near Newcastle. E. W. Chapman is at the head of the enterprise.

Plumas.

Bulletin: Work in the tunnel of the Bald Mountain drift mine near La Porte is being pushed. —The Red Slide M. Co., P. T. Turner Supt., has its tunnel in 725 feet in bedrock. During the last 50 feet much water has been encountered. Six men are employed.

—At Whisky Diggings, near Gibsonville, Schofield Bros. are driving a tunnel, which is now in 1000 feet. They have struck gravel.

—The La Porte Con. M. Co., the principal stockholders of which are residents of Duluth, Minn., own the Dutch hydraulic mine near La Porte. A. H. Holgate is Supt. The com-

pany is putting in a debris dam and lowering the cut. Two flumes on the Feather river ditch are being constructed preparatory to active operation of the mine next season.

San Bernardino.

The Grable mines near Old Baldy, which were bonded a year ago for \$20,000, have been bought at the price named and are being developed by H. C. Oakley of Ontario, Cal. They are running tunnels and showing up a quantity of good ore, which is being sacked. Arrangements are being made to erect a mill there, on the completion of which the ore will be treated by the cyanide process. The ore assays from \$10 to \$100 to the ton.

San Diego.

The Union hears that operations will be resumed in the near future on the Stonewall mine, at Julian, the owners of the mine, the Sather Banking Co. of San Francisco, having contracted with a San Francisco firm to work the tailings on a percentage. There are about 20,000 tons on the dump, and it is thought they will yield at least \$5 to the ton. The cyanide process will be used. The Stonewall is one of the biggest mines in southern California and was at one time valued at \$2,000,000. The mine was closed on account of litigation several years ago and no work has been done on it since.

Shasta.

Lowden & Friday, owners of the Lowden group of copper mines at Mary's Fork, have bonded the same to W. Kemp, Supt. for Lewishon Bros. of New York, for \$50,000.

Free Press: At Harrison Gulch the Midas M. Co., controlled by J. H. Roberts of Sacramento, is running a 10-stamp quartz mill. The chlorination works, recently destroyed by fire, is being rebuilt. The company's payroll amounts to over \$9000 per month. The most extensive improvement being made by the company is the construction of about four miles of ditch and flume. The water will furnish power for the operation of the entire plant. Steam is the motive power now in use. The cost of constructing the ditch and flume is estimated at \$10,000, and the work is almost completed. The company has a large force employed on the improvement work, the rebuilding of the chlorination plant and in the mine and mill. Everybody has money, business is good and the camp is prosperous.

Sierra.

(Special Correspondence). —There is a reasonable probability that the Feather Fork Gravel Co.'s property, commonly known as the Thistle shaft, will resume work. A proposition has been submitted to the company in Scotland, which, if accepted, will soon see this section in its old-time activity. The property has a covered dump-house of 10,000 tons gravel capacity and a reservoir capable of 30,000 gallons. When the mine became flooded about a year ago and was unwatered, all the drifts were found filled with sand and fine gravel, to clear which would have involved heavy expense, and the company concluded to cease operations. The people now trying to negotiate with the owners for a bond propose to operate upon a new plan and utilize the old shaft. It is thought the matter will be decided within a few weeks.

Gibsonville, Aug. 28th, '98.

W. W. York, who has been developing his quartz property for some time near Downieville, is putting up a 5-stamp mill.

The Clay Bank tunnel at La Porte is being pushed and the pay channel is expected to be reached this fall. The property is operated by M. L. Regua of San Francisco.

W. York is having ten tons of rock crushed in the mill at the Sierra mine.

Siskiyou.

The mill at the King Solomon mine near Yreka has temporarily closed for want of water, but the force in the mine has been increased. —Wyke Bros. working the river bed near Sawyers, have had good success this season. —At the Great Western, Eddys Gulch, a 5-stamp mill is kept busy crushing the output. —The Cheery Creek and Wheeler mines have been sold to Fry & McCauley, who will at once put a force on development.

Work on the Hoboken mine near Fort Jones is being pushed.

On the Cherry Hill group work is being pushed day and night, the winze being down 75 feet, showing a 4-foot vein of good quartz. This winze develops the property to a depth of 400 feet.

The Big Two and Lost Leonore mines, near the Klamath, owned by White & Musgrave, have been bonded for eighteen months to Conklin & Snowgoose of Utah for \$10,000. Development work will begin at once.

The Gold Run M. Co., in the Salmon river country, has completed a flume and ditch at a cost of about \$150,000, and are running ten stamps. The Aromas M. Co. has also built a new ditch, costing \$28,000. The Know Nothing M. Co. is running three stamps with success. On the whole, the district presents a prosperous appearance, and the indications for the future of that section are encouraging.

Trinity.

The Tip Top M. Co. at Dedrick has started work with ten men on the Ralston group of mines and will develop them. The vein has been traced by cuts and prospect holes for 700 feet on the surface.

There is more activity among the miners of Trinity county at present than there has been for some time. At the Brown Bear mine, near Deadwood, an 8-foot ledge of rich ore has been struck in the lower tunnel, but, owing to great length, an upraise is being made to connect with an upper tunnel, so that there will be good air when the company starts to drift on the ledge. —At the Lappin mine the owners are taking out rich ore. The ledge in this mine is from 3 to 8 inches wide.

A strike has been made in the Enterprise mine, on the North Fork of Trinity river, of a

3-inch seam which yields rich values. Besides this seam leasers are working on a ledge from 8 to 10 inches wide which mills \$100 per ton.

Tuolumne.

The recent advance in Santa Ysabel stock from 4 1/2 to 5 1/2 on favorable reports from the mine. The Santa Ysabel has got its water supply back and will be enabled to run the mill full time.

The Jumper mine, at Stent, has an annual production of \$400,000 to \$500,000, and is owned by a Scotch Co., incorporated as the Jumper Gold Syndicate of California, Ltd. The main working shaft is an incline and a little over 700 feet deep, with levels at every hundred. Drifts from these points aggregate in length 3000 feet. A new shaft has been started a short distance from the old, and so far off the vein that it will require sinking on the perpendicular to a depth of 2000 feet to effect a contact. The old shaft may also be driven deeper, but at present no sinking is being done; miners are now crosscutting at the 700. The property is equipped with a 20-stamp mill and an additional twenty stamps will be added the coming fall. Fifty tons of ore are put through every twenty-four hours. Preparations are also being made to put in a cyanide plant at once. The Jumper mine proper also includes the New Era, a north extension. Ninety men are on the payroll; M. D. Kelly is Supt., and P. G. Gow is Pres. and Gen. Mgr. In the Dutch mine, at Quartz, the main shaft is down 755 feet, with sinking still progressing. It has a good body of high grade ore. All the underground workings are exhaustive, with the result that drifts of an aggregate length of 5800 feet have been run. To expedite work, an additional 10-drill compressor has been put in. The 20-stamp mill is crushing day and night, and is run by steam, although a change to electricity is contemplated. A. Trittenbach is Supt. Sixty-eight men are employed.

Democrat: Although the pocket mines continue to turn out gold, almost all of the big properties are hung up for lack of water. Prospectors are doing well in every direction, and the coming rainy season will mark a greater activity in mining than ever existed before.

Yuba.

Democrat: Since the stockholders of the Good Title Co. at Indiana Ranch decided to not purchase the mine under the option, the former owners have been taking out quartz and milling it and making good wages, besides the operating expenses.

COLORADO.

BOULDER COUNTY.

Three carloads of ore shipped from the Wirth mine at Ward gave returns of 6 ounces in gold for the first class and 3.64 ounces for the second class. The lot netted \$120. Eight carloads of mill dirt shipped from the same mine gave a general average of \$20 per ton in gold. J. McCorkle has sold his Little Alice mine at Rowena for \$100,000 to H. E. Blair, a Cincinnati millionaire. Mr. Blair has ordered a \$30,000 plant of machinery for the mine. A lot of 300 pounds of ore from the Great Britain, on Gold Hill, leased to Knott & Co., yielded at the rate of \$81 a ton without sorting.

Boulder News: The Delano mill and the Regiona mine at Magnolia changed hands last week, the Venture corporation of London, represented by State Geologist T. A. Rickard, taking possession, but whether on a lease or by actual purchase is not known.

CHAFFEE COUNTY.

The Arctic mine of Winfield district is shipping 100 tons of ore per day which runs \$15 per ton.

CLEAR CREEK COUNTY.

The Con. Alunde mines at Idaho Springs have opened an ore body 3 feet wide on the tenth level, of which 8 inches is high grade.

EAGLE COUNTY.

Twelve carloads of ore were shipped from Battle mountain section last week, which is the best record this year. The working force on the properties is being increased and the output will soon be greater.

EL PASO COUNTY.

The big dump of the Strong mine at Victor has been leased by V. Baum. He expects to install four concentrating tables. Samples from four experiments on the concentrates gave values from \$90 to \$95 per ton. The royalties are 15 per cent on all concentrates, and 25 per cent on all rock saved. The lessees operating on a portion of the Matos's Gold Hill property produced 964 tons in July, worth \$36,000, at a cost of about \$13,000, leaving a net profit of over \$23,000. Returns from a carload of stuff saved from the dump of the Lillie on Bull Hill, by Lessee Pettie, gave a return of \$114 a ton, while screenings yielded \$80.

Cripple Creek News: Three carloads of ore, estimated to be worth \$1000 a ton, was sent out from the Portland mine. It is thought that returns from this shipment alone will bring \$100,000.

The rich ore which the Portland people are shipping in such quantities is not coming from the strike made some months ago on the Hidden Treasure claim, but from a more recent find. It is not a discovery of an ore body previously unknown, but is an increase in values and dimensions of the shoot which the men have been following. It is the junction of the two veins known as the Portland and the Portland No. 2 veins. They have joined each other at an angle, and at this junction the ore body is 50 feet wide, and in some places a little more. At the last regular meeting of the directors the manager was instructed not to take out more than \$100,000 per month. But when a body of high grade ore was found the production advanced to such an extent that before the middle of the month the production had reached the figure above which he did not wish to go, and this single three-car shipment will double the amount. The Vindicator is shipping ore from seven

different shafts. In July the company made a net profit of 2 1/2 per cent on its entire capitalization. A strike on the Lucky Guss was made of a 15-inch lead running from \$195 to \$600 per ton. The Simmons lease on the Zenobia sent out twenty-two tons of ore that returned from \$140 to \$700 per ton. Five tons gave the higher figure.

The weekly clean-up of the Florence cyanide mill amounted to \$135,000.

Lessees on the Vindicator mine, Cripple Creek, are making money for the company. One set of lessees is outputting twenty tons per day, averaging \$50 per ton. Another is shipping fifty tons per week of low grade. Another is shipping fifty tons per week of \$30 ore, and saving screenings that run from \$50 to \$100 per ton.

GUNNISON COUNTY.

At Crested Butte the Plouvis Bros. have a good lead property in the Iowa and are taking ore out for shipment. A 4-foot vein has been opened on the Augusta, which carries about 60 per cent lead and will be concentrated at the Pittsburg mill, which is to start soon. Whipp & Samsel have cut the vein they have been tunneling for near Gothic. It is said to be 7 feet in width and assays 500 ounces in silver. A fine body of ore has been opened in the Sylvanite at Gothic and shipments continue as usual. Everything at the Yankee Blade is being put in shape for the continuance of work the ensuing winter.

GILPIN COUNTY.

The lessees of the Notaway shipped ten tons, which gave returns of eighteen ounces for one one lot and nineteen ounces gold for the other lot, or \$339 and \$359 per ton.

HINSDALE COUNTY.

At Lake City, the Lillie shipped a car of copper galena which returned about \$600 net. This property is being worked by Boston people who recently purchased it. The Ute & Ule at Henson is shipping twenty tons of concentrates daily. Hampson Bros. of Chicago will work the tailings from the Ute & Ule mill at Henson.

LAKE COUNTY.

A. V. Hunter has sold the Union smelter near Leadville to the Arkansas Smelter Co. Shipments from the Ibox averages nearly 1700 tons per week. The Mahala mine is again on the shipping list. This property, embracing about eight acres, has been shipping sulphide ore, some months as high as 200 tons a day.

The output of the Leadville mines over the various railroads to the smelters of the State is as follows: The Rio Grande 300, South Park 300 and the other road 150 tons, making a total of 750 tons. The Arkansas Valley smelter receives 900 tons daily. The Bimetallie smelter receives daily 250 tons from Leadville mines, making the daily output of ore 1850 tons per day.

The *Herald-Democrat* says the pumps of the down town mines at Leadville will soon be contributing 1,000,000 gallons of water per day to the Arkansas.

The Dolly B. mine of Leadville is limited in output to forty tons daily of gold-lead ore, the balance of the time being taken up in hoisting the waste that accumulates in development work.

LA PLATA COUNTY.

In the East Mancos district a 30-inch vein of decomposed matter has been found in the Sundown lode, which runs \$40 in gold per ton. It is so soft that it is shoveled directly from the vein into the sacks.

MINERAL COUNTY.

Creede is shipping an average of 300 tons of ore per day and working 500 men.

OURAY COUNTY.

Ten tons of milling and concentrating ore is the output from the Shoemaker mine near Ouray. On the plates the values saved are \$30 per ton. The concentrates are also good value and furnish occasional carloads for shipment.

PARK COUNTY.

A big placer property will soon be in operation near Fairplay. A ditch for the operation will be nine miles long, and a contract for five miles of ditch 9 feet wide has been let, the contract to be completed in thirty days. The remaining portion will be completed this fall; washing gravel will commence early in the spring.

PITKIN COUNTY.

The mill of the Aspen Concentrating Co. is running night and day on Bushwhacker ore, and giving satisfaction in saving values. Ore running from five to seven ounces in silver is being concentrated and the value raised to \$35 to \$40 per ton.

SAN JUAN COUNTY.

At Mineral Point the Vermillion mine struck a vein of gray copper running \$96 per ton in gold and silver. The title to this property has been tied up for more than twenty years, and last fall G. L. Stevick undertook to unravel the legal complications. After a year he succeeded and the mine is now on a paying basis. The Vermillion, San Juan Chief and Ben Butte were originally silver properties and large mills were built for treating their ore, but in the past year gold has been found on them. The San Juan Chief and the Ben Butte are shipping ore running from four to five ounces. Denver and Chicago capital has taken hold of the Idaho claims on Kendall mountain, and men are at work cleaning out the tunnels and other openings, repairing the mill and machinery and getting ready to crush and concentrate 100 tons of ore per day. There are large bodies of ore to be broken down and it will require about sixty men to operate the mine and mill.

The contract for building 1000 feet of flume for the Silverton & Boston M. Co. at Silverton was last week completed and R. F. Baker, president of the company, left for Boston, taking plans and specifications for a proposed

50-stamp mill and several bids received from contractors for its erection, all to be submitted to the company he represents. The Sioux City mine, an old property that has in years past been worked to a considerable extent, is again being tested. A sample of ore was taken from a large quantity on the dump and assayed 1.08 ounces gold, sixty ounces silver and 11 per cent copper. The Juno, an old-time shipper of a good grade of grey copper and lead, has resumed work.

SAN MIGUEL COUNTY.

At Telluride the U. S. & B. C. M. Co. has taken a lease on the Little Maud and Agnes lodes for \$55,000 in several payments. Work on the properties, which carry gold exclusively, is to begin at once. It is this company that is developing the Liberty Bell, and has control of most all of the other claims in Cornet Creek basin.

The Meldrum tunnel has reached a depth of 1000 feet on the Telluride end and about 400 feet on the Red Mountain side. Work on both sides is going steadily forward. The work on the San Miguel side is not yet out of the conglomerate formation, in which progress is slow, the ground being hard to drill and breaking short. On the Red Mountain side the ground is loose and needs to be timbered.

SUMMIT COUNTY.

At Kokomo the Sellers mine is shipping large quantities of ore, the Nettie B. is putting out two loads of lead carbonates a day and the Ida L. has opened a 2 1/2-foot vein of ore with a 10-inch pay streak.

IDAHO.

The Golden Fleece mill at Centerville has started up. A shaft was recently sunk on the Golden Fleece 108 feet and a drift run to tap the ledge 60 feet below the old tunnel. The vein is 8 feet wide, and two veins—one 1 foot and the other 2 feet wide—carry high-grade ore.

At Long Valley one hundred men and several teams are at work on the nine-mile ditch for large placer ground about to be worked. The ditch is 7 feet wide on the bottom and will be completed before fall. The dredge on Moore creek near Idaho City is running day and night.

Near Hope, a strike has been made on the B. F. & H. mine. The ledge has been tapped at a depth of 125 feet with a tunnel 225 feet long, and an ore body is exposed, carrying gray copper and native wire silver. Ore of shipping quality is being taken out.

Wallace Press: A new ore crusher is being put in the Standard mill, East Wallace. The Black Cloud tunnel is in 950 feet; 450 feet more should take it to the ledge. The Morning mill began running full capacity last week. So far only one side has been in operation, there being not enough water power to run the entire plant. A 190 H. P. engine has been installed. The Mother Lode mill has been dropping stamps during the week, so have the two Chest mills, and the Daddy. The King mill will also drop stamps and the Granite Co. is ready to start its mill.

Avalanche: The Empire mine at Silver City has been unwatered to the eighth level and rock is being hoisted. On the Cumberland Supt. Easton reports development work progressing. No stopping is being done, but ore is taken from the drifts and winzes. He expects to resume sinking soon. Scales & Smith, owners of the tailings near De Lamar, will enlarge their mill capacity this fall about double. W. H. Townsend is erecting a mill and flume. At the Trade Dollar the new pump has arrived and is expected to handle the strong flow of water with ease.

MICHIGAN.

The output of the Osceola Con. M. Co. for July was 800 tons of ore, yielding 80 per cent copper, being 640 tons. The copper is stated to have cost not over 80 per pound, leaving a net profit to the company of 40 per pound. By an invention of Capt. Parnell, which is applicable to jigging, the efficiency of each stamp is locally reported to have been increased as follows: Maximum capacity per stamp conglomerate rock, heretofore 225 tons per day, by Capt. Parnell's process 390 tons per day; maximum capacity per stamp on amygdaloid rock, heretofore 300 tons per day, by Capt. Parnell's method 495 to 500 tons per day. The Osceola is using five stamps and has commenced the erection of two more stamps. At the rate of July's production, each stamp turned out 160 tons.

MONTANA.

(Special Correspondence.)—Libby Creek is a noted placer camp that has been worked in a small way for years. The creek is about thirty-five miles long and has numerous feeders. The mineral belt known as the Carbonate Range runs parallel with the creek on the west side. The three principal quartz mines are the Buzz Saw, Snow Shoe and Silver Cable. The Buzz Saw ore is a gold, silver and lead carbonate assaying as high as \$70 in gold. There are two ledges, one from 4 to 6 feet, the other from 18 inches to 3 feet in width. The group consists of six claims, four of which are patented. Several carloads of ore have been shipped; smelter returns from which were \$43 per ton. There is 200 feet of development work done, consisting of tunnels, shafts and upraises.

The Snow Shoe was idle for some time, but was sold this spring to an English syndicate for \$175,000. It lies twenty miles from Libby in the Carbonate Range. The company has a concentrator of 100 tons capacity and is a steady shipper. The ore values are lead, silver and gold.

The Silver Cable has recently built a 50-ton concentrator. The ore is an iron sulphide and galena, principal value gold, it carries values in silver and lead.

Libby, Aug. 23rd, '98.

At the Montana M. Co. the total output for July was: Gold, 2740 ounces, and silver, 14,010 ounces, obtained from 6500 tons of ore

crushed in the mills, and 11,636 tons of tailings from the dams brought under treatment. The estimated realizable value of the produce of crushings is \$39,300; the estimated realizable value of the produce of tailings is \$23,300; total, \$62,600. Expenditure.—Working expenses on revenue account, \$28,700; outlay on developments, \$8,500; extraneous expenses, \$300; permanent improvements and machinery, \$100; treatment of 11,636 tons of tailings, \$13,128; redemption of cost of tailings plant, \$4,072; total, \$54,800. Estimated net profit, \$7,800. The 50 and 60-stamp mills were in operation for twenty-eight and twenty-nine days respectively. The tailings plant was in operation for thirty days.

The Ontario mine near Rimini will be sold by the Merchants' National Bank of Helena for \$65,000, by an order of court, to T. E. Collins and W. J. Clark. The purchasers pay the following installments: Ten thousand dollars at the end of six months, \$15,000 at the end of twelve months, \$20,000 at the end of eighteen months, and the remainder at the end of twenty-four months, making in all \$65,000. In addition they are to expend not less than \$10,000 for machinery and improvements in the mill, which is to remain a part of the property in the event of final forfeiture. The Ontario property includes the Ontario, Blue Bird, Gladstone and Millie quartz lodes and two others unnamed, and also a water right of 50 inches.

Ore hauling to the mill at the Gilt Edge mine near Lewiston was stopped last week and the crew is engaged in cleaning up the mill preparatory to its abandonment. The cause of this is that a deal has been closed for the Phelps-King interests to a syndicate with which A. R. Ledoux and A. R. Deveroux, capitalists of New York, are connected. Phelps and King retain large interests and Mr. King will continue as Gen. Mgr. Machinery for a new 150-ton mill has been ordered, which will be one mile nearer the mines than the present mill. Work will be commenced on the new mill at once.

Butte Miner: The matte of the Butte & Boston and Boston & Montana runs about 50 per cent copper and when it is run through the converters is nearly pure copper, running from 95 to 98 per cent, but having in it still the gold and silver values carried by the ore of the Butte camp. The Helia Consolidated at Glendale is employing 200 men, with two furnaces running. New bodies of ore have been discovered and opened in the Atlantis, Helia, Trapper and Clive mines, and this new supply of lead ore will enable the company to continue the smelting of the high grade ore, of which they have had heretofore a large supply. The July payroll was \$30,000, or twice the amount for July, 1897. At Phillipsburg, after a week of inactivity the Bi-metallic mine has resumed operations. The pending disagreement has been adjusted and the miners have gone to work.

NEVADA.

(Special Correspondence.)—There is a certainty of a revival of old-time activity at Candelaria, Columbus mining district. The Holmes M. Co. own a large quantity of tailings at Belleville, amounting to several hundred thousand tons. These tailings are accumulations from the time the Northern Belle was discovered in the sixties. The Northern Belle ran forty stamps most of the time until 1884, when the Holmes Co. took over the property until 1892. After 1892 seventy stamps were run on this ore. It need not be stated that these were silver mines. The value of these tailings, taking silver at 60 per ounce and gold at standard value, is computed at \$7.13 per ton, of which \$3 is in gold. These tailings were originally the result from rebellious ores and had to be roasted for the purpose of destroying the sulphur in the sulphates, and a considerable percentage of salt had to be used in the roasting. After the ores were roasted the values were saved by the process of pan amalgamation. For a long time it was considered impossible to work these tailings successfully by any of the best known leaching or cyanide processes, but the management now feels satisfied that they have arrived at a process of working these tailings by other means and independent of pan amalgamation, and while they are not divulging their process it may be surmised that it is similar to the cyanide method—that the pulp is treated first to a strong solution of cyanide in agitating pans, the liquid being drawn off, and then the pulp conveyed to a second system of vats, where it is leached a certain number of hours in a mild solution of cyanide mixed with caustic soda, and then drained into tanks for saving the silver. The reason for working these tailings first in agitating pans is that 78.01 per cent is so fine as to pass through a 70-mesh screen and the pulp would lie so close in an ordinary cyanide process as to prevent percolation through it, so that part of the pulp must be agitated to bring the particles of gold and silver in connection with the cyanide 13.0, and 5 per cent remains on the top of the 70-mesh screen, 8.6 per cent from the top of a 50-mesh screen, and 8 per cent remains on the top of a 20-mesh screen. The chief value in gold remains on the part lying above the 20, 50 and 70-mesh screens. The chief value in silver passes through the 70-mesh screen.

It may be taken for granted that the management have arrived at a definite plan for working the tailings, as they have given orders for machinery to work them.

It is understood that the savings will amount to something over \$5 per ton, and that the cost of working will not exceed \$2 per ton. The Holmes Co. and the Georgine Co. have a large amount of from twelve to twenty-ounce silver ore developed and on the dumps, and their ore carries with it not less than \$2 per ton gold; and by the process about to be inaugurated these low grade ores can be worked at a cost not exceeding, for mining and reduction, \$3.50 per ton.

Within a short time a plant for treating 100 tons per day will be completed at Belleville,

and this within a few months later will be increased to 500 tons daily capacity.

The Holmes mine contains a large amount of sulphuret ore. A shipment has been made to Virginia City to ascertain what percentage of the sulphurets can be saved on the Willey concentrator. Much of the ore in the Candelaria district is heavily sulphuretted, and this test will demonstrate to what extent the sulphurets of these ores may be saved by this method. If successful, prosperity for this district is ensured, as it will give occasion for the employment of many men and the camp will become a prosperous section.

It has been contended by some of the old time mill men that there is no process for working the ores of the Candelaria district outside of roasting and pan amalgamation. These men in their generation no doubt used the best known methods for handling these ores, but it should be borne in mind that other districts having rebellious ores, which could not be worked ten years ago, now successfully treat their ore and its products by either the cyanide or leaching process, and that tests can be approved or condemned only after a trial on a systematic and extensive scale, and no mine owners possessing either tailings or low-grade ores can arrive at a definite result unless they work or try the same, inasmuch as neither tailings nor low-grade ores lying idle will solve the problem.

This company has continued experiments on low-grade ores since their mines closed down in 1891, and they are now satisfied that they have arrived at a practical solution for working their property. If the result is satisfactory, this camp will become again one of the best in the State, ranking second only to Virginia City in the heyday of its prosperity.

Hawthorne, Aug. 28th, '98.

It is locally reported that J. W. Nelson has practically retired from the Charley Ross group of mines at Deerlodge and that in future it will be handled by the Eastern owners. Only a short time ago the camp was visited by a representative of the Eastern shareholders, who, after inquiring into affairs, paid off claims amounting to \$15,000, the remainder to be discharged in a short time, when arrangements will have been perfected for the resumption of work upon the group.

The Virginia City Enterprise reports from Cherry Creek a strike in the Egan mine of ore running \$60 in gold and \$110 in silver to the ton and that it is a large body.

The White Pine News says that work at the Chairman mine has temporarily suspended, awaiting the return of C. D. Lane to install a new system of pumping plant, after which it is expected that sinking the shaft will be resumed.—The tailings from the Brunswick mill, also from the Chollar, Virginia City, are to be worked by the Eureka Cyanide Co. at Eureka mill.—The Dexter mine at Tuscarora last week shipped \$11,000 in cyanides and \$4000 in gold bars.

The Glasgow & Western Exploration Co. contemplate the erection of further furnaces at Golconda and a general extension of the plant. They are also erecting a 100-stamp mill at Cherry Creek, White Pine county, the concentrates from which will be brought to Golconda for smelting.

The Hope mill at Silver City is to have an addition of five stamps and will crush custom rock at \$2.50 per ton. This ought to increase the bullion output of the district.—The Young America mine, at Tuscarora, is to have a new mill and concentrating plant. From Aurora 600 pounds of cyanide tailings were shipped to Gold Hill for refining.—A gold nugget valued at \$100 was found last week in the Dun Glen placers, by Chinese, four of whom average \$10 each a day in sluicing when water is plenty.—The mills in Union canyon, Nye county, are running constantly on good ore.

Elko Independent: An effort is being made to prospect the Owyhee river bed, near Mountain City. Harris & Co. have a big sinking pump working night and day to reach bedrock. The impression has prevailed among mining men for years that the gravel of this stream is rich. As high as 15 cents to the pan was obtained some years since on the rim rock, but bedrock has never been reached in the main channel.

NEW MEXICO.

At Cooks, on the Inez claim, S. Lindauer makes regular shipments of a good grade ore.—The Kansas City S. & R. Co., has sixty men employed and is shipping forty tons of ore per day from the Othello and Desdemona mines. These mines have produced 12,000 tons of ore a year for three years.—The Commodore mine shipped two cars of lead ore, running 65 per cent lead and ten ounces of silver per ton.

The strike of \$70 per ton ore at the Tripp mine, near Hillsboro, has widened to 4 feet, and the output has increased to forty tons per week.—Fifty tons of ore from the Mastodon mine is being hauled to Collard's mill this week. It assays \$45 per ton.

Wheeler & Co., leasers on the K. K., made a shipment of sixty tons to the smelter.—The Snake and Opportunity mines employ thirty-five leasers, all of whom are making over \$4.50 per day.

OREGON.

Urie & Brewster will build a dredging plant on the river near John Day. It will have a capacity of 2000 yards of gravel per day, employing from twenty to thirty men. The boat will be 24 feet wide by 80 feet in length, and will be required to sustain a weight of seventy-five tons of machinery apparatus for washing gravel.

Nine and one-half tons of rock from the Gold Bug mine near Ashland in a mill test yielded \$23 to the ton.—Application has been made for a receiver for the Greenback mine near Grants Pass. The Greenback mine it is reported has yielded Browning & Hannum \$20,000 the past twelve months, working by crude methods only. It is under bond to Car-

ton & Sutherland of San Francisco for \$100,000.

Grants Pass Journal: Hull & Beck's 5-stamp mill will be completed next week. There are several hundred tons of high grade ore on the dump.—Sisby, Carr & Co., who have the Green ledge under bond, are running an upraise to connect with the tunnel.—J. T. Clark & Son of Grave creek sold a half interest in their hydraulic mine to J. O. Booth. The ditches and plant are to be enlarged for this season's operations.—The Eagle Creek D. Co. of Duluth, Minn., which has been building ditches and flumes for placer mining on Eagle creek near Union and on which they have expended \$20,000, have turned on the water. There is one giant ready and two others will soon be ready. The pressure is 200 feet, and each giant throws 700 inches of water and washes 1000 cubic yards a day. When completed, the plant will handle 3000 yards in twenty-four hours.

In the Collateral at Baker City much development has been done. The crosscut tunnel 230 feet from the Blacksmith tunnel in the Virtue to the Collateral ledge will be completed about September 10th. The Virtue mill is being overhauled preparatory to a continuous run on ore whose values are good.

SOUTH DAKOTA.

From Deadwood it is reported that the gold output of the Black Hills for the current year will reach \$8,000,000. The Homestake made the following monthly cleanup during the fiscal year ending June 1, 1898, the figures having been copied from the report of the superintendent:

| | |
|--------------------|--------------|
| June, 1897..... | \$172,396 80 |
| July..... | 186,092 60 |
| August..... | 238,807 51 |
| September..... | 169,031 62 |
| October..... | 187,137 99 |
| November..... | 195,845 26 |
| December..... | 233,390 16 |
| January, 1898..... | 210,308 38 |
| February..... | 196,935 77 |
| March..... | 211,301 84 |
| April..... | 188,057 37 |
| May..... | 264,180 32 |

The total earnings for the year were \$2,494,374.53, the product of 548,890 tons of ore. The total dividends paid by the property up to date is \$6,787,500, and the report is concluded with the statement that there are twenty years' ore in sight. The report further states that on the 1st of May the mine began furnishing ore to 140 additional stamps, making 540 in all dropping on Homestake ore.

UTAH.

Last week's shipments from Tintic were 124 cars of ore, 6 of concentrates and 233 bars of bullion.—The finding is reported of a 10-foot ledge of ore in the Reck Rabbit, at Mammoth, which goes \$29 gold, eighty-eight ozs. silver and 14 per cent copper.

From Silver City forty carloads of ore were shipped last week.—A strike is reported in the old Oregon near Alta at a depth of 375 feet in the shaft which was begun many years ago. Recently work was resumed by putting the shaft down a few feet deeper, uncovering a streak of steel galena which, it is said, will run high in silver and lead. Work will continue throughout the season.—The Grizzly at Alta has begun the delivery of ore that showed over 30 per cent copper, in addition to other metals.—At the Regulator ore has been exposed that shows 40 per cent copper. Everything indicates steady improvement as work progresses in the old camp that for many years has been neglected.—Last week the Marsac refinery shipped nine bars of silver to New York that was 1000 fine. The product was from the Ontario tailings.—The shipments of ore from Park City last week were: Silver King, first-class, 708,000 pounds; Silver King, concentrates, 510,000; Ontario, first-class, 78,000; Anchor, concentrates, 429,000; Loring Bros., concentrates, 10,840; total, 1,735,840 pounds.—The Copper King made a trial shipment of ore from their property in Big Cottonwood. The shipment sampled 11 per cent copper, between \$2 and \$3 in gold, and a few ounces silver.—The McGregor mill started last week. About sixty-five tons of crude ore are worked every twenty-four hours. Aside from several hundred tons of ore on the platforms, a thousand tons of leasers' second-class ore is being brought to the mill.—The Brooklyn at Bingham has good ore in the 250 and is making a shipment. Ore is also showing in the 110 and 300 levels.—The Queen in Butterfield expects to deliver 150 tons of milling ore at the Dewey mill within thirty days.—In the Erie is a streak varying from 16 inches to 2 feet 7 inches of good pay ore, assaying 25.2 per cent copper, 30.6 ounces silver, \$2 gold and 25 per cent iron.

The Joe Bowers of Silver City made a shipment, the first class of which yielded 122 ounces silver, 8.6 per cent copper, 10 per cent lead and 80 cents in gold.—The Chloride Point at Mercur made its first shipment of cyanides amounting to 400 pounds.—The Omaha Co. at Mercur has begun prospect work by starting four shafts. They expect to sink them at a cost of \$3.50 a foot. R. Walker is Gen. Mgr.—Latest shipments of ore from the Blue Bird mine, owned by the Golden Star M. Co. of Gold Mountain, show 12½ ounces in gold and 58 ounces in silver, with a valuation of \$276.54 per ton.—Ore from the Buckeye at Silver City yielded 50 per cent lead, 30 ounces silver and nearly \$10 in gold per ton.—The Creole at Park City marketed its first lot of concentrates, consisting of about fifty tons, that will be followed by regular shipments the remainder of the season. A short time ago the management decided on the erection of a set of jiggers to determine whether or not the proposition would concentrate. The experiment was a success, and now the company will follow up the present plant with an up-to-date concentrating plant, on which work will begin in a short time. The concentrates, in which two and one-half tons of crude ore are being put into one, show a valuation of 35 per cent lead, 25 ounces silver and \$2.50 in gold.

The Mammoth Record says that at the

Snowflake a winze is being sunk from the 300 level through a fine body of quartz.—A shipment of ore is being taken out from the new strike at the Lower Mammoth. A new body of ore has been found in the North Star at the 300-foot level, and assays show good values in silver, lead and gold.

Mercur Miner: C. E. McEntire has secured a bond on the Glencoe for Eastern people and is developing the property extensively will at once begin. The bond is for \$30,000. The claims adjoin the Overland, upon which a mill will be in operation by Oct. 1st. Nearly 2000 feet of work has already been done on the property, and three gold veins have been uncovered.

Mercur Mercury: The unusual drought is causing fears of a water famine at some of the mills. It is reported that the Sunshine mine and mill will be started up in September.—At Marysville, on Gold Mountain, all the older properties are working steadily and continuing to improve. At the Mammoth and Breckenridge there is scarce a doubt that the erection of the proposed mill will be undertaken early next spring.—At the Blue Bird, owned by the Golden Star Co., Capt. Egan is achieving good results, and an impression prevails that it will put up a mill.—A shortage of water has prevented operating the mill at the Holland group as long as reckoned on, but the work done during the year has been satisfactory.

Tribune: The Golden Gate mill and refinery is working satisfactorily and at times 600 tons of ore pass through them, with an average of 500 tons daily.—The management of the South Swansea announced that the unloading of the bins would commence at once. For some time the South Swansea has been experiencing trouble in the getting of ore cars. In addition to the heavy shipments from the Grand and those from the Bullion-Beck, that refrained from shipping for so long a time, there is the usual amount to be moved from the old producers, and everything appears to be booming as in old days.

WASHINGTON.

In the Gold Bug mine near Garfield a strike of good ore has been made in a 235-foot tunnel. The ledge is 2 feet wide and assays \$111 a ton.

FOREIGN.

BRITISH COLUMBIA.

(Special Correspondence).—J. Pinkerton has bonded his hydraulic on Lowhee creek to an English syndicate, represented by a Mr. Bremner, for \$4000 cash and \$40,000 in deferred payments. Mr. Bremner has also bonded the Consolidated Eleven of England gravel property, owned by W. H. Woolcock, H. Jones, F. J. Tregillus, W. S. Beedy, A. H. Beedy and A. Johnston. The terms are not known, though the amount is large and a cash payment was made. The property comprises about one mile of Lightning creek, just below the town of Stanley. The creek from two miles above Stanley down to the upper end line of the Eleven of England has yielded \$10,000,000. It seems that the only means of opening the Eleven of England is by a long drainage tunnel, requiring much more money than local people can afford. If this is done a very valuable mine will be developed.

The Lightning Creek Gold Gravel & Drainage Co. has begun a tunnel on lower Lightning creek near Windham Hill, about fourteen miles below Stanley. The scheme, which was promoted by a Major Moore, is being industriously boomed by a British Columbia mining journal. It is locally viewed as a wildcat. There is no known or probable pay drift diggings on Lightning creek within ten miles of where this company's tunnel will reach bedrock. The flotation of this operation contains a feature somewhat new: stock is not sold, but bonds, secured by the stock, are offered the public with apparent success.

A subsidiary company of the new Slough Creek Co. is opening a bench hydraulic on Slough creek near Burns creek. Some heavy development work is being done, including five miles of ditch. S. Medlicott is Mgr.

At Slough creek drifting continues steadily under the efficient management of J. Hopp.

The Cariboo Gold Fields elevator on Williams creek near Barkerville has made a good beginning in rich gravel. The water supply having been found insufficient, the trouble is being partially remedied by the construction of a dam at Ground Hog lake. With an adequate supply of water this will be a very profitable mine. About \$400,000 has been expended to date. L. A. Bonner is Mgr. vice J. Champion, removed.

The Cariboo and Yukon Gold Fields, Ltd., is prospecting for the deep channel of Upper Antler creek near Saw Mill Flat. A tunnel has been driven 150 feet at a right angle to the creek, and a blind shaft sunk 25 feet. As the tunnel is only 4 feet above bedrock at the entrance, it appears that the channel has been found. H. Boursin is in charge during the absence of Mr. Carry, who is in the Yukon country.

The Olsen bucket ladder dredge is working smoothly in pay on Quesselle river, twenty-one miles above Quesselle.

At the Waverly hydraulic on Grouse creek a reservoir is under construction. The heavy rainfall this summer has made this an unusually prosperous season for the hydraulics.

The Big Valley Creek Mines, Ltd., is to be reorganized and work will soon be resumed. Barkerville, B. C., Aug. 17th, '98.

J. Monaghan, Pres. and Gen. Mgr. Cariboo M. & S. Co., of the Cariboo mine, Camp McKinney, reports for the year ending July 1, 1898, that the mill crushed 6770 tons of ore during the year and yielded \$121,270 in bullion and \$17,943.64 in concentrates.

At Vancouver on August 31 was discharged with costs the appointment of the receiver of the Le Roi mine at Rossland, recently made by Judge Spinks. Application was immediately made to Justice Irving for the appointment of a receiver, but he decided to only

grant an injunction of the mine from shipping more than 100 tons of ore daily.

From Rossland shipments from the mines the past week were 970 tons.

At Whitewater about 100 men are employed at the Whitewater mine, 40 by the Whitewater Deep, 20 at the Northern Belle and 12 by the Charleston. The wages are \$3 to \$3.50 per day in all the mines.—The Eureka, near Nelson, has been sold to W. H. Watts for \$30,000. The Eureka is a free milling proposition, traversed by two leads, one of which is 5 feet wide, assaying from \$15 to \$20 in gold.—The improvements at the Trail smelter, recently undertaken by the C. P. R. R., are nearly completed. They represent an expenditure of \$150,000 and make the total value of the plant between \$300,000 and \$400,000. The capacity of the works will be 500 tons of copper ore daily; the lead stack will handle between 150 and 200 tons. The name of the plant since it was acquired by the C. P. R. R. is the Canadian Smelting Works. There are over 20,000 tons of ore, valued at half a million dollars, thrown up in long piles, each of which burns for two months and a half to rid itself of the sulphur. The rate for treating the Rossland ores at the Trail plant is \$7.50 per ton, which includes a freight charge of 50 cents per ton. Shipments to the smelter average between 250 and 260 tons per day. The principal shippers are the War Eagle, Center Star, Iron Mask, Sunset No. 2, Deer Park, Giant and Monte Christo. There are about 200 men employed and the payroll is \$15,000 per month.

ITALY.

The mineral production of Italy in 1897 was as follows:

| | No. of works. | Tons. |
|--------------------------|---------------|---------|
| Pig iron..... | 6 | 8,393 |
| Wrought iron..... | 24 | 149,945 |
| Steel..... | 12 | 63,940 |
| Copper, crude..... | | 2,980 |
| Copper, manufacture..... | | 8,545 |
| Zinc..... | | 250 |
| Lead..... | 4 | 22,407 |
| Antimony..... | 1 | 404 |
| Mercury..... | 2 | 192 |
| Mineral fuel..... | 22 | 567,000 |
| Sulphur, crude..... | 673 | 496,158 |
| Sulphur, refined..... | 24 | 86,372 |
| Rock salt..... | 72 | 429,253 |
| Asphalt..... | 3 | 18,034 |

There were also produced 316 kilogrammes of gold and 45,315 kilogrammes of silver. The number of men employed was 25,695.

MEXICO.

It is locally reported that F. M. Alzpuru has sold the Providencia iron deposits and foundry at Guanajuato to an agent of the Rothschilds for \$1,500,000. The purchasers will build a line to Ciudad Guzman for the development of the property. Mr. Alzpuru bought this property four years ago for \$50,000.—The new 20-stamp mill of the Yolo M. Co., near Baviacoran, is in successful operation.

C. G. Codeman, at his mine in the Panuco district, Durango, reports everything satisfactory. He has cleaned out the shaft of an abandoned Spanish mine, finding at 180 feet a 14-foot vein of ore averaging fifteen ounces of silver, and carrying a 10-inch streak of 200 ounces of silver ore. He is securing other properties in the same locality. J. W. Sharpe, Mgr. Gonzales mine, reports a large deposit of ruby silver ore in the lower level, which assays 1600 ounces silver per ton.

ONTARIO.

At Seive River the Golden Star mine has reached a depth of 336 feet and is showing good ore. The mill will be in operation Sept. 15th. One hundred men are employed. Building an electric road from the mine to the mill is in progress.

SERBIA.

At the Dobro coal mine, which until recently yielded only lignite, a seam of good coking coal has been discovered. With a view to developing Serbian metallurgy, a company with a capital of 2,000,000 francs has been formed for the manufacture of coke from this coal. Another company has been promoted by French capitalists for working the antimony mines at Losnica, the silver and lead mines of Uranja, and the gold mines of the Timok valley.

Recent California Mining Incorporations.

Golden Treasure M. Co., Grass Valley; capital stock \$100,000; subscribed \$3500; C. R. Eager, E. Dubedat, C. W. Taber, E. R. Gray, W. Kenrie, F. DuImaine, J. E. Sterns.

New Manzanita G. M. Co., San Francisco; capital stock \$15,000; subscribed, \$10,000; F. Korbel, T. Korbel, C. Gretz, T. Ruiz Rojas, J. Hass.

Summit Con. G. M. Co.; capital stock, \$20,000; subscribed, \$4000; S. Clark, F. B. Bull, W. H. Routledge, R. Armstrong, C. W. Edgemube.

Mead G. M. & M. Co., San Francisco; capital stock, \$200,000; subscribed, \$55,000; U. H. Jens, G. Gall, N. Hansen, A. M. Jones.

App Con. M. Co., San Francisco; capital stock, \$750,000; subscribed, \$125; H. Wadsworth, S. P. Smith, W. M. Weighel, S. J. Hendy, G. H. Waggoner.

Gold Reserve M. Co., San Francisco; capital stock, \$100,000; subscribed, \$50; J. A. Thompson, F. Reichert, J. H. Moss, C. B. Larabee, J. H. Barnard.

Leviathan Copper M. Co., Loepe, Cal.; capital stock, \$1,000,000; subscribed \$600,000; D. Bari, P. & H. W. Curtiz, E. E. Brooks, P. N. Packard.

Recently Declared Mining Dividends.

Yellow Aster, California, July dividend, declared Aug. 17, \$35,000.

Geyser-Marion, Utah, 2 cents per share, \$6000; Aug. 31.

Cariboo M. Co., B. C., \$16,000; payable immediately.

Wolverine, Michigan, \$1 per share, \$60,000; payable Oct. 1.

A REVOLUTION IN FREIGHTING.

THESE WAGONS ARE ESPECIALLY ADAPTED FOR STEAM FREIGHTING; CAPACITY OF TRAIN 50 TONS.

'The Daniel Best' 50-Horse Power Traction Engine.

The most powerful and only Successful and Practicable Road Engine in the World. Over sixty of them in use in this State, and they are being Successfully and Profitably Employed in Hauling Logs, Lumber, Ore, Salt, Borax and other kinds of freight. The work is being done **FIFTY PER CENT** Cheaper than it is possible to do with Animal Power. They can be operated over any ordinary road where it is practicable to use mules or horses, doing the same work. They can ascend or descend grades as much as 20 to 30 inches to the rod, hauling their loads of 35 to 40 tons, depending upon the condition of the roads; loads may be increased to even greater amount on moderately level roads. Send for descriptive Circulars and price List of Wagons and Engine. We solicit correspondence. No trouble to answer questions. Estimates made for complete Steam Freighting Outfits. Address

THE BEST MANUFACTURING CO., SAN LEANDRO, CAL., U. S. A.

Joshua Hendy Machine Works,
San Francisco, Cal.

Canton Steel Co., Denver, Colo.

GENTLEMEN:—The Canton Steel has been handled by us for the last two years, during which time we have had only two complaints, and in both cases the trouble has been lack of knowledge of tempering on part of the blacksmith doing the sharpening.

The English steel has been entirely knocked out in our section, as the Canton steel has taken its place at half the cost.

We have tried many well-known brands of American steel, but none have given such entire satisfaction as the Canton.

There is no rock too hard for it, and it will stay wherever introduced.

Yours truly,

THE MCCORMICK-SAEITZER COMPANY,

GOLD IN COLORADO!

Colorado has within its limits some of the great-
est gold mines that has ever been discovered. In
Cripple Creek in 1892 there were a few prospectors
looking over the hills; in 1895 the camp turned out
over \$8,000,000 in gold. Leadville, the old bonanza
camp and the mineral product of which made Den-
ver what it is to-day, is becoming a big producer of
gold. New inventions for working low-grade gold
ores, together with the discoveries made to work
rebellious ores, have opened up a field for the min-
ers such as they have never enjoyed before, and
Colorado has inducements to offer such as no other
district in the world possesses; the record of the
State in gold production for the last three years
speaks for itself. Among the other prominent
camps in the State are Telluride, Ophir, Rico,
Silverton, Mineral Point, Durango, La Plata,
Ouray, Saw Pit, Ironton, the Gunnison district and
many others. New finds are being made and new
camps are springing into existence every day.
The Denver & Rio Grande Railroad, which is the
pioneering road of Colorado and which has always
been the miner's friend, reaches all the mining
camps in Colorado. For elegantly illustrated
descriptive books, free, of mines in Colorado

PATENTS

DEWEY, STRONG & CO'S PATENT AGENCY.

Our U. S. and Foreign Patent Agency presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American reports, with full copies of U. S. Patents since 1872. All worthy inventions patented through DEWEY, STRONG & Co.'s Patent Agency will have the benefit of a description in the Mining and Scientific Press. We transact every branch of patent business, and obtain patents in all countries which grant protection to inventors. The large majority of U. S. and foreign patents issued to inventors on the Pacific Coast have been obtained through our agency. We can give the best and most reliable advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and circulars free.

MARSH STEAM PUMPS.

SINKING AND STATION PUMPS

For Mines.

**BOILER FEEDERS,
Deep Well, Tank and Vacuum Pumps.**

The MARSH SINKING PUMPS are Superior in the Following Points:

- First—Compactness.
- Second—Strength of parts.
- Third—Fast speed, quiet action.
- Fourth—No throttle valve necessary in exhaust pipe.
- Fifth—Steam valve self-governing: will not race or pound if water gives out with steam valve wide open.
- Sixth—All moving parts can be covered and protected from falling dirt.
- Seventh—No packed joint between chamber and pump to give out and need renewing.
- Eighth—Exhaust can be turned into suction.
- Ninth—All parts easily accessible and fewer than in any other pump.

VULCAN ROPEWAY

— WITH —
**AUTOMATIC ORE LOADER AND
AUTOMATIC DUMPING DEVICE.**

For Conveying
Ore, Cordwood,
Etc.

EMPIRE, NEVADA, April 17, 1896.
Vulcan Iron Works.—GENTLEMEN: The Ropeway furnished by your company to convey tailings from Morgan Mill to Mexican Mill, a distance of seven-eighths of a mile, is giving entire satisfaction. We transport 200 tons of tailings in ten hours; one man does the whole business, including elevating tailings from hopper in the ground, operating Vulcan self-loader, and attending to the Ropeway generally. The self-dumper requires no attention whatever. The Vulcan loader I consider the best feature in the whole Ropeway, making it possible for one man to load 200 tons in ten hours.
Yours very truly,
J. P. WOODBURY, Supt.

We beg to call attention to our

High Speed Special Rolls

as being the most efficient and the most economical machine for fine dry crushing ever placed upon the market. The rolls having

NARROW FACES and LARGE DIAMETERS

can be fed evenly over the whole width of faces with certainty, and hence the faces or crushing surfaces are easily kept true. Descriptive pamphlet on application.

HIGH SPEED SPECIAL ROLLS, WITHOUT HOUSING.

Double rope tramways are acknowledged to be superior to those of the single rope type, and any one contemplating the erection of a tramway should investigate the merits of the . . .

THE ONLY AUTOMATIC TRAMWAY BUILT.

FINLAYSON PATENT AUTOMATIC WIRE ROPE TRAMWAY.

In this system the cost of transportation is brought below any figure heretofore reached. Its tonnage capacity is unsurpassed. Further information on application.

THE GUTTA PERCHA AND RUBBER M'F'G CO.

30 and 32 FREMONT ST., SAN FRANCISCO.

Spadone's Concentrator Belts. Patented.

The "SPADONE" Curved Edge Concentrator Belt is attracting much attention among mining men, its merits appealing to the millman of practical experience.

Illustration (Fig. 1) shows a cross-section, and (Fig. 2) shows the edge flanging outwardly as it passes over the pulley. This relieves the strain from the top and bottom of the edge by directing the strain automatically to the inside face surface of the edges. Heretofore all belts have been so constructed that when they pass over the pulleys or rolls, a direct strain comes upon the top or at the base of the edges, causing the edges to break away from the body of the belts in a very short time. We avoid this Mechanical Defect by our Spadone Curved Edge. Belts made to fit any machine—4, 5 and 6 feet wide. Prices and samples on application.

FIG. 1.

FIG. 2.

We shall be pleased to quote you also on Water, Air Drill, Steam, Suction and Fire HOSE, RUBBER BELTING and RUBBER PACKING. Correspondence Solicited.

Market Reports.

The Markets.

SAN FRANCISCO, Sept. 1, 1898.

SILVER.—London, 28d; New York, 60; San Francisco, 60; Mexican Dollars, 46½@47c.

COPPER.—Last week the Franklin M. Co. sold 100,000 lbs. at 12½c. Foreign exports from New York since Jan. 1st, '98, aggregate about 24,000,000 lbs. Lake is reported \$12.15@12.25.

LEAD.—New York reports "easy," \$4.05 bid, \$4.07½ asked. Smelters quote \$3.90; local, pipe, 6@6¼c; sheet, 6½@7c; pig, 5½c; bar, 6c.

IRON.—American, soft, \$20 and \$23 per ton; Scotch, \$23. The Iron and Steel Sheet Manufacturers' Association of the United States is in session at Pittsburg to fix prices for the ensuing year. Sec. Jarrett says that prices will be advanced probably \$2 a ton for sheets, in response to advances already made in raw materials. At the conclusion of the meeting it was announced that twenty-two establishments were represented and fully resolved, on account of the recently increased cost of billets, sheet bars and spelter, to advance selling prices of black steel sheets 10 per cent per 100 lbs., and of galvanized sheets 5 per cent.

SPELTER.—Unchanged, 5½@5½c.

TIN.—Menlo Roofing, redipped, \$7; English, to arrive, \$4.50; Pig, 18c; Bar, 19c.

ANTIMONY.—9½, 10.

BABBIT METAL.—10-12-14—best 16c.

QUICKSILVER.—Domestic, unchanged, \$42.50@43; export and carload lots, special rates.

POWDER.—F. o. b., San Francisco: No. 1, 70% nitro-glycerine, per lb., in carload lots, 15½c; less than one ton, 17½c. No. 1* 60%, carload lots, 13½c; less than one ton, 15½c. No. 1** 50%, carload lots, 11½c; less than one ton, 13½c. No. 2, 40%, carload lots, 10c; less than one ton, 12c. No. 2* 35%, carload lots, 9½c; less than one ton, 11½c. No. 2** 30%, carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 728 kegs, \$1.50 per keg; less car lots, \$2 per keg.

FUSE.—Triple tape, \$5.10 per 1000 feet; double tape, \$4.85; single tape, \$3.45; Hemp, \$3; Cement No. 2, \$4.35; Cement No. 1, \$3.45.

CAPS.—3x, \$5.50 per 1000; 4x, \$6.50; 5x, \$8; Lion, \$9.

COAL.—San Francisco coast, yard prices: Wellington.....\$8 00 Coos Bay.....\$5 00 Seattle.....6 00 Southfield.....7 50

Commercial Paragraphs.

THE Fort Wayne Electric Corporation and the Tutthill Water Wheel Co. have shipped from San Francisco an electric lighting and power apparatus to South America. The machinery will be landed in Peru and sent overland 600 miles to the mines in the Andes beyond Lake Titicaca in Bolivia.

POSITION WANTED

By Experienced Chemist and Assayer. Cyanide Treatment a Specialty. Address CYANIDE, Mining and Scientific Press Office, San Francisco, Cal.

WANTED.

Partner in Extensive Placer and Quartz Mines. Free wood and water. JAMES ARTHUR, Cornucopia, Union Co., Oregon.

WANTED

GENERAL SUPERINTENDENT

Having experience and perfect knowledge of mining large bodies of ore, and familiar with square setting. Man now occupied in this position preferred. Prefer mining engineer having a knowledge of milling and machinery. Good salary, with chances of advancement.

Address only in confidence LOCK BOX NO. 1252, SALT LAKE CITY, UTAH.

Mine Wanted.

Man of experience will develop gold mine for ¼ interest, or will bond whole property and develop. Must have ore chute IN SIGHT. State exact conditions. Correspondence with owners only. Address P. O. Box 887, Los Angeles, Cal.

WANTED.

METALLURGIST AND PRACTICAL SMELTER

Will be open for engagement October 1st as Superintendent of Copper or Lead Smelting Works.

Thoroughly competent in analyzing, assaying, and handling men. Speaks Spanish. Excellent references. Address SMELTER, care Mining and Scientific Press.

Mine Operator Wanted.

The owner of a Mine (Lead, Silver and Gold), situated in the State of Nevada, near railroad, would like to get a partner willing to take charge of the property and work it, or form company. No money wanted; the owner has confidence in the value of the mine and will take his chances. Property consists of two claims, 1500x600 feet; both have been worked and ore shipped to different reduction works. The owner, being engaged in other business, has no time to attend to the mine.

Address E., this office.

Assessment Notices.

CONSOLIDATED ST. GOTHARD MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Nevada County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 11th day of August, 1898, an assessment (No. 1) of 10 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the secretary, at the office of the company, 113 Crocker building, sixth floor, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 25th day of September, 1898, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on WEDNESDAY, the 25th day of September, 1898, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

J. F. HOLLING, Secretary.

Office—113 Crocker building, sixth floor, San Francisco, California.

WEST SANTA ROSALIA GOLD MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, State of Sonora, Mexico.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 3rd day of August, 1898, an assessment (No. 1) of three (3) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the secretary, at the office of the company, No. 30 Pine street, Rooms 15 and 17, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 5th day of September, 1898, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 25th day of September, 1898, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

J. W. PEW, Secretary.

Office—No. 30 Pine street, Rooms 15 and 17, San Francisco, California.

NATIONAL CONS. MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Rich Gulch, Shasta County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 22nd day of August, 1898, an assessment (No. 4) of ten (10) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the secretary, at the office of the company, 916 Market street, Room 57, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 3rd day of October, 1898, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 31st day of October, 1898, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

GEO. W. FLEISSNER, Secretary.

Office—No. 916 Market street, Room 57, San Francisco, California.

JUNCTION MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Tuolumne County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 10th day of May, 1898, an assessment (No. 1) of 14 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the secretary, at the office of the company, 106 Leidesdorff street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 25th day of June, 1898, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 25th day of July, 1898, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

Boiler Explosion at Buffalo, New York.

Explosions of stationary steam boilers on the Pacific coast are noticeably rare, the percentage of such casualties being less than that in the Mississippi valley and on the Atlantic slope, a fact creditable to this region and accounted for largely by reason of good workmanship in their construction, intelligent supervision and watchful care.

A study of such an unfortunate occurrence is always of value to all users of steam everywhere, for though newspaper accounts of those casualties usually say "the cause of the explosion is shrouded in mystery," yet examination often shows the cause direct or indirect, and detailed notice aids in prevention of recurrence of a similar character elsewhere.

The most recent occurrence of this nature serious in its effects was the explosion of the steam boiler at the Niagara factory of the National Starch Manufacturing Co., at Buffalo, N. Y., on July 14th, where seven people, including the engineer and fireman, were killed and twenty-one injured.

The accompanying illustration will give an idea of its effect and extent. There was a battery of five horizontal tubular boilers, 5½ x 16 feet, with 4-inch tubes. The boilers had been in use about ten years.

Fig. 1 shows four boilers. Boilers 1, 2 and 3 are standing in about their original positions. No. 4 was turned end for end and thrown about 20 feet from its setting and broken through the top seam, all the rivets being sheared off, the opening being the width of the lap, i. e., about 4 inches at its greatest width. At the left side of Fig. 2 can be seen the dome of the fifth boiler, which exploded. Since these photographs were taken boiler No. 5 has been uncovered and found to have been spread out by the force of the explosion into a flat sheet, the front head having been blown out and the back head torn into several pieces. The break was on the inside seam next to boiler No. 4, all the breaks in the boiler being at the riveted joints. No. 5 boiler was thrown about 80 feet from its original position by the force of the explosion. Fig. 3 shows the remains of the main engine and fly wheel back of the stack, the wreck being covered by debris. Fig. 4 shows the Oneida street side of the wreck. (The factory was situated on the corner of Bond and Oneida streets, the boiler room being on the Bond street side. These illustrations were taken after gangs of men had

worked three days clearing up the debris.) While nothing is known definitely as to the cause of the explosion, there is some circumstantial evidence which throws a little light on the possible cause.

In the first place, the regular fireman was not at work that day and a substitute who was not a fire-

the boilers leak, and while it is not clear how the device could possibly have made the boilers leak, if they did leak, this fact would indicate that they were in a bad condition previous to the explosion, especially as there were no riveted joints on the bottom. The conviction is that the boilers had been in a faulty

condition for some time, notwithstanding they were supposed to have been inspected by an insurance company June 26, 1898.

The condition of boiler No. 4 shows that it had been overheated, and the colors of the iron on the sides could not have possibly been produced had there been much water in the boiler. They show a distinctly blue line part way up the sides and extending lengthwise of the boiler. It is stated that the boilers were cleaned the day before the explosion. A commission of engineers was appointed by the Mayor of Buffalo to investigate the explosion and determine the cause. At this writing their report is not to hand. At the time the photographs were taken from which the accompanying illustrations have been engraved Inspector Maltbie of the Fidelity and Casualty Co. was standing beside a huge tank, upon which was placed what had once been a boiler, but was then simply a huge and nearly square piece of boiler iron, as flat as if it had been run through a pair of giant rollers. When the explosion occurred the boiler parted at the side, and the rent is as straight and even as though the rivets had been drawn and the parts separated by a mechanic. In fact, in many places the rivets were blown out, the sheet iron remaining intact. This fact may be taken as an indication that the explosion was not due to any defect of the boiler itself. Inspector Maltbie was not inclined to discuss the explosion further than to say that the chances were that the cause would always remain a mystery. "It may have been due to low water," he said, "although I don't want to be quoted as advancing that theory. Each of the boilers had an independent water feed, and it would have been possible to allow the water to become low in this one and at the same time to have kept the others full. There are a dozen other things

VIEWS OF THE BOILER EXPLOSION WRECK AT THE NIAGARA STARCH WORKS, BUFFALO, N. Y.

man—that is, had not been working regularly as such, and who possibly was not competent in an emergency—had taken his place. Boiler No. 5, which exploded, is supposed to have been in poor condition, and a device which had been attached to the boilers had been thrown out a few months before, because the Starch Works Co. claimed that it made

which might have brought about the same result," he added, "but at present I do not care to add to the many theories already advanced. My duty now is to clear away the wreck as soon as possible." Asked as to the inspection of boilers, he said they made an exterior inspection every three months and an interior once a year, the last on June 26.

THE MARKETS.—The Local Markets; Mining Share Market; Sales in San Francisco Stock Board, 274.

MISCELLANEOUS.—Concentrates, 251. The Occurrence of Platinum in the Oural Mountains, 252. Ladders for Underground Service, 253. Electric Transmission from Mechanville, on the Hudson, 254-255. Is Darwinism True? A Great Stone Bridge; Singular Accident to a Hoisting Rope, 256. Coast Industrial Notes; The First Water Jacket; Commercial Paragraphs; Personal; List of U. S. Patents for Pacific Coast Inventors; Notices of Recent Patents; Recently Declared Mining Dividends, 257. Oxidation of Amalgamating Plates; Roasting Ore at Keswick, Cal.; "For Further Consideration!" How to Store Powder, 261. Recent California Mining Incorporations, 274.

The St. Keverne Mining Co. of Spokane, Wash., experiences the usual difficulty of mining companies organized on the non-assessable treasury-stock plan, and wants its stockholders to sign an agreement to pay an assessment "levied whenever the president of the company deems it necessary." Acquiescence in such a plan will probably be proportionate to the confidence of the stockholders in the integrity and business ability of that official. In Washington, unless under special agreement, it is impossible to levy assessments upon holders of non-assessable mining stock, a condition in which it is believed the disadvantages are sufficiently manifest to occasion a change.

The average success of several large electrical schemes, in connection with mining enterprises in California, has been sufficient to indicate similar commercial profit in other States, notably in Colorado, which is beginning on a large scale to do what has hitherto been found successful throughout that commonwealth in a minor degree. Recently the Colorado papers have had excellently written accounts of the opening of the electric power transmission plant at Canyon City, where, at a cost of nearly \$750,000, electric power is generated to be conveyed thirty miles, which marks a new era in the prosperous Cripple Creek gold district. In Platte canyon, twenty-three miles from Denver, is in preliminary shape a \$2,000,000 project to generate and transmit to the Colorado metropolis electric energy for light and power; and near Lake City, Hinsdale county, where lie large quantities of low-grade ore, another electric power plant is contemplated.

On the 1st inst. there was a change in the San Francisco mint officers. Incidentally is noted the record of that national institution. It annually puts more money into circulation than all the other U. S. mints combined, and has the lowest record of loss of any similar institution. During the four years ending Aug. 31st, '98, were coined in money \$153,697,834, there being handled during that time bullion valued at over \$300,000,000. The record for one day's coinage is \$620,000. During last month the coinage aggregated \$8,160,000. Of this, \$5,135,000 was in gold \$20-pieces; \$1,162,500 in gold \$10-pieces; \$1,764,500 in gold \$5-pieces; \$30,000 in silver half dollars; \$27,000 in silver quarter dollars; \$41,000 in silver 10-cent pieces. The total number of pieces of money coined during the month was 1,303,300. It takes as much time and labor to coin a silver 5-cent piece as a \$20 gold piece. The gold coined came from both sides of the Pacific coast—much of it from Australia in the shape of English sovereigns, which, after being recoinced, go out as American money, \$1,000,000 of which is now on the transport ship Arizona to pay U. S. troops at Manila.

Mines and Railroads.

This week is received the preliminary report of the Interstate Commerce Commission, which in admirable form gives exact statistical information regarding one of the great industries of the country—the building, maintenance, operation and business of the American railways. Reading the carefully collated summaries, one is moved to wish that some similar details could be secured relative to the great mining industry of the country. It is believed that such data would show more satisfactory business result, and appeal in strongest terms to the dividend desiring investor. During '97 the railways of this country paid \$40,979,933 in taxes: the aggregate dividends of the year were \$57,290,579. In Kansas, Wisconsin, Arkansas, Colorado, Oklahoma and Indian Territory the taxes exceeded the dividends by nearly \$3,000,000. In Texas they exceeded the dividends by \$1,000,000. In New England and the Northeastern States generally the dividends exceeded the taxes. The average of the profit columns shows that the railways, as a whole, had to carry a passenger 500 miles to earn one dollar, and had to carry a ton of freight 15.30 miles to earn one cent. The decline in freight rates is shown by a thirty-years table, exhibiting that in 1867 the rates per ton per mile were 1.925 cents, and in 1896, .806 cents per ton per mile—from nearly 2 cents to 8 mills, a fall of 58 per cent.

It is questionable if any line of business anywhere shows such depreciation in rates, and it is doubtful if any other great business is conducted so economically and intelligently and yet with so small a margin of profit. The elaborate report before us makes a poor showing as an investment proposition.

A contrast between mine and railroad investment indicates that the former is by far the most inducing. The absence of any detailed general mine report similar in scope and character to that of the Interstate Commerce Commission makes it impossible to speak positively, but it appears manifest that, taken in its entirety, those who invested in properly conducted mining operations in the past few years have much better returns for their money than anything that recent railroad annals can show.

On June 30th, '97, there were in this country 128 railroads in the hands of receivers: these roads represented a mileage of 17,861 miles. The aggregate capital stock of these roads was \$486,064,610. There is probably no metal mining region anywhere in the United States where a similar amount invested in mining operations would not make a vastly better showing than do these railway forms of investment, so dear to many who decry all manner of mining investment. The leaks and drains, the untoward conditions of business that preclude present possibility of profit in railway business are prominently and pleasurably absent in the mining world.

"Carrying Coals to Newcastle."

During a recent trip to Sonora, Cal., it was noted that an excellent improvement was being made in the town in the shape of a new and commodious courthouse. Judging from the beginnings which have been made, it is destined to be an ornament to the county.

It was noted further that a curious and surprising condition existed in regard to the selection of trimmings for this building. Instead of using stone taken from within the county, imported stone of much less beauty is being used. Several carloads of sandstone were observed in transit over the Sierra railway or being hauled in teams from its terminus at Jamestown. Four miles above Sonora are marble quarries which it is believed competed in the effort to obtain the contract for the stone for the new San Francisco postoffice. In addition to the marble, there is an abundance of good granite near at hand. It is difficult to understand how so little home pride could be shown by those having the drawing of the contract in charge, that they would permit sandstone which has to be transported miles to replace the marble or granite near at hand.

This is a small matter, but one too often illustrated in California, and it is not to be wondered at that many home resources remain undeveloped where so little local pride exists.

Improvement in the Cyanide Process.

The improvement in the metallurgy of gold made practicable by the introduction of the cyanide process seven years ago marked an epoch in gold mining. The advance in closer and more profitable working has been chronicled, and its apparent limitations in some class of ores have been deemed but temporary restrictions of its greater usefulness. The bulk of the precipitates and the special requirements of solution treatment have been the main obstacles to complete success. It was thought in '93 that the electrolytic deposition of gold would successfully solve at least one of these problems, but the financial results do not, so far, seem to exceed the older method.

In the current number of Cassier's Magazine J. W. Richards, discussing cyaniding, cites the fact that "from all ordinary gold salts the very weakest of reducing agents throw out the gold immediately. Those in common use are charcoal, hydrogen sulphide, copperas, oxalic acid. None of these, however, have the slightest effect on cyanide solution. Chemical research has disclosed the fact that the compound of potassium cyanide and gold cyanide is not a mere mechanical mixture of the two cyanides, but is an entirely distinct triple compound of potassium, gold and cyanogen, whose stability is somewhere about the average of that of the component cyanides. It is, therefore, no longer a question of breaking up a simple gold salt; it is more a question of breaking up a potassium salt. Not only thermo-chemical data, but also electro-chemical observations, point to the existence of potassium auro-cyanide, in which the potassium is the basic element, and gold and cyanogen form the acid radical. Such being the probable truth in the matter, we must, in order to get the gold, literally dispossess the potassium, providing it with some other negative radical, and then split up the gold cyanide. Some of the strongest reducing agents can effect this. Charcoal, if used in quantity, and given time enough, can do it. Sodium or potassium—used as amalgams, magnesium, aluminum, and zinc can effect it, the latter only when in shreds so as to offer a large, clean surface, and with many jagged points from which gas can be liberated, the latter metal being the only chemical participant in actual use. The chemical action involved is not simple, and brings into play the caustic potash which was generated during the solution of the ore. The zinc plays a double role. One-half of it splits up the auro-cyanide, and precipitates the gold; the other half displaces hydrogen in the caustic potash. The bearing of these on the course of the precipitation is two-fold: First, if the zinc has a flat, smooth surface, the gas forms a thin layer on it which stops the precipitation; a jagged, uneven surface allows the gas to form into bubbles, and so escape; second, the two zinc salts produced react on each other and produce insoluble zinc cyanide, which deposits on the zinc and hinders its reaction. This disposition can be prevented only by having a considerable excess of free potassium cyanide in the solution to take up the precipitated zinc cyanide and form the soluble double cyanide, or, in other words, to prevent this precipitation. Experience has shown that when there is less than 0.1 to 0.2% of free potassium cyanide present, the precipitation of gold is very imperfect. "Zinc can thus not be used with the more dilute solutions."

Prof. Richards asserts that electrolytic precipitation solves the question of precipitating dilute solutions, and draws other conclusions that will not be wholly accepted. Evidently the last word has not been spoken thereon, and, like other metallurgical modes and methods, gold cyaniding is still a progressive science.

THE United States is the only nation that is discussing the question, "Should the United States retain the Philippines?" Every other nation assumes the affirmative and every commercial instinct favors the idea. To this west half of the continent the idea particularly commends itself; to the Pacific coast it means great enlargement of trade; to California it is an unsurpassed opportunity; to San Francisco it opens an opportunity to "about face," and be the front door instead of the back door of the nation. A glance at a map of the Pacific ocean and its shores should be sufficient to suggest to every American the immediate desirability of such island acquisition.

Concentrates.

A "BARREL" of copper means 900 pounds. It is a Michigan idiom.

PRESENT platinum quotations in New York are \$14.50 to \$16 per ounce.

AMONG the 1200 miners at work in Aspen, Colo., three-fourths are leasers.

THE Bullion-Beck mine at Tintic, Utah, will market 2000 tons of ore during September.

THIRTY THOUSAND tons a month is said to be the output of the Kemmerer coal mine at Kemmerer, Wyoming.

A CONTRACT has been made for 3,000,000 bricks to be used in the construction of the Highland Boys smelter at Bingham, Utah.

FROM Australia during the last twelve months has been received at San Francisco gold aggregating in value \$23,793,129.

AT the Old Jordan cyanide mill at Bingham, Utah, there are twenty-seven zinc tanks working at a capacity of fifty tons daily.

THE Sonora, Cal., Democrat says that a conservative estimate of the annual gold output of the Jumper mine at Stent, Cal., is \$400,000.

THE assessed valuation of mining property in Stevens Co., Wash., for 1898, is about \$1,000,000; of this, \$300,000 is against the Republic mine.

WOLFRAMITE is a submetallic black, brown, opaque iron-manganese tungstate, (Fe, Mn) WO₄, crystallizing in the monoclinic system.

AT the Homestake mine, South Dakota, the wear and tear of shoes and dies is thirty-seven to forty-five pounds, respectively, per 100 tons of ore.

A RICH Colorado copper property is the F. Hough, on Engineer mountain, near Lake City, the ore going about 25% and valued at \$65 per ton.

THE Silver King mine at Park City, Utah, is said to have an ore body 200 feet wide on the 1100-foot level. The ore produces silver, lead and gold.

IN the 800 level of the Homestake mine, Black Hills, S. D., the ore body is said to be 600 feet wide. The property has been operated twenty years.

THE Epigram of Baker City, Oregon, says that the monthly payroll of the mines of that locality amounts to \$106,000. Of this, \$70,000 is paid for wages.

IN a fifteen-minute drilling contest at Greenwood, B. C., Aug. 26th, D. J. McClune, assisted by a turner, drilled 32½ inches in granite. The purse was \$250.

OPHIR, Colorado, a town of only 400 inhabitants, has electric lights, water works, churches and schoolhouse, and ships the year round, daily, two cars of concentrates.

ON the narrow gauge road of the Arizona Copper Co., Clifton, Arizona, a seventeen-ton engine runs on a twenty-four-pound per yard rail. The gauge is 30 inches.

AT Bannack, Montana, three dredge boats are in constant operation. The boat built by the London company is 135 feet long; it cost \$85,000 and has a daily capacity of 3000 cubic yards.

FROM sulphurets from the Black Oak mine, Tuolumne Co., Cal., an extraction of 90 per cent of the gold and 90 per cent of the silver is obtained at a cost of \$3.50 per ton, by the cyanide process.

AT De Lamar, Nevada, work has been begun on the De Lamar to double its present daily 300-ton capacity. It is locally stated that the present net earnings of the property exceed \$120,000 a month.

THE recent Eastern rise in copper from 11½ to 12½ cents is solely due to the close of the war and the fact, manifest to Europe, that copper must be immediately secured, it being an indispensable material.

THE Starliss M. Co. contemplates putting up a large precipitating plant at the Starliss copper springs at Bingham, Utah, and a 50 H. P. electric plant, hoist and pumping apparatus for the mine.

IN Mexico commissioners have been appointed for the Paris Exposition by all the State governments. The industrial and agricultural centers are making great preparations to place their resources before the world.

IN Mercur, Utah, it is reported that an effort will be made to have the next Legislature revoke the eight-hour law, and that leading mining men in the State are at work in the matter. The report is causing much comment.

AS to the scour of water-course beds, ¼-foot per second will scour fine clay; ½-foot, fine sand; ¾-foot, coarse sand; 1 foot, fine gravel; 2 feet, round pebbles 1 in. diameter; 3 feet, angular stones size of a hen's egg, 5 feet, conglomerate.

THE Rose Valley Borax Works in Harney county, Oregon, are outputting 80,000 pounds a month. C. L. Taylor, the owner, has contracted to deliver 80,000 pounds a month for three years. He ships to Winnemucca, Nevada, 144 miles, where the product is loaded on cars for the East.

A GOOD cement for cracks in boilers or to secure steam joints is made as follows: Litharge in fine powder, 2 parts; very fine sand and quicklime (that has been allowed to slake spontaneously in a damp place), of each 1 part. Mix and keep it from the air. It is made into a paste with boiled oil before application.

ACCORDING to the Canyon City, Colo., Record a mill is being built in the Grand Canyon, twelve miles above that town, with a process for treating ores by which rock running less than \$2 will pay from \$15 to \$20 per ton, which causes the Telluride, Col., Journal to suggest that on this basis common quarry stone ought to pay well.

DURING the first month of the war the new subscriptions to the MINING AND SCIENTIFIC PRESS fell off, as compared with the ratio of the past few years, but in the last three weeks the renewal of interest in mining is abundantly illustrated by the increased number of orders for the paper from all parts of the country, Colorado, Utah and Arizona, especially.

THE cost of cyaniding ore is a variable figure, depending on the character of the ore, economy, management, situation, etc. Several mills treat ore for less than \$2 per ton. So far as known, the Mercur, Utah, is as minimized as any in that direction in this country—the cost there being 85 cents per ton. South African mills claim, in some instances, to successfully cyanide ore at a cost of 60 cents per ton.

THE El Dorado Co., Cal., Democratic Convention in their

platform put the following plank: *Resolved*, That we are in favor of the amendment of the mining law passed by the last Legislature, so as to do away with the necessity of doing \$50 worth of work within sixty days after location. Also an amendment providing for the recording of mining notices in the mining district when the mine is located.

IN electrical precipitation of gold from cyanide solution, in the Siemens-Halske process, the anode is iron and the cathode is lead. In the Pelatan-Clerici process the anode is iron and the cathode is an amalgamated copper plate covered with a bath of mercury. Zinc anodes cannot be used, for the zinc oxide which is formed reacts with the ferrocyanide of potassium formed during the leaching, insoluble ferrocyanide of zinc being formed.

AT a special meeting of the executive committee of the Cal. State Miners' Association in S. F., on the 6th inst., the time and place for the annual convention of the association was agreed upon. The session will be held in San Francisco, beginning at 10 A. M., Monday, Nov. 21st. Messrs. Parsons, Sonntag and Byington were constituted a committee to make all necessary arrangements therefor. Secretary S. J. Hendy reported \$431 in the funds.

ADVERSE rulings in Montana, Utah and elsewhere, locally reported during the week, emphasize the need for a Department of Mines and Mining. Nothing is ever settled till it is settled right, and the mining industry of this nation, whether it be in Massachusetts, South Carolina, Texas, Idaho, Colorado, or anywhere else, will never be rightfully recognized and justly treated by the Government till there is a Department of Mines and Mining.

IN the Government mines at St. Andreasberg, in the Harz, two new batteries of nine iron stamps have been installed which are said to do nearly twice as much work as the wooden ones they replace. With a fall of 10 inches the iron stamp treats in twenty-four hours 1.8 tons of ore with a consumption of 2.6 gallons of water per minute for the two batteries. The wooden batteries consumed 4.4 gallons of water per minute and treated only 1 ton of ore per stamp.

TO DETERMINE whether a given low-grade gold or silver ore can be profitably concentrated, take a weighed quantity of dry pulverized ore passed through a 40-mesh screen, such as will be an average sample of the bulk of ore treated, say one pound, after having previously assayed the sample. Pan this quantity carefully into a second pan, and repan until all the sulphurets are separated from the gangue, then dry and weigh the sulphurets and assay them. The weight represents the percentage of sulphurets the ore contains.

THE hoisting engine at the Anaconda mine, Anaconda, Mont., built in '82, is to be replaced by one of the horizontal type, with a capacity for hoisting from a depth of 5000 feet. The ore will be hoisted in a skip containing twelve tons, filled directly from ore bins or chutes below, and on arriving at the surface will be automatically dumped in ore bins. This skip will be used only for hoisting ore, and in the other compartment of the shaft will be a cage containing four decks for lowering and hoisting men, cars, timber and machinery.

A TRUSTWORTHY test for the presence of acids in oils is to use a tincture of phenol phthalein, and render it alkaline with a little caustic soda, shaking up the suspected oil with a little of the test reagent. The red color of the tincture will be discharged if acid is present in the oil. The proportions to add are as much phenol phthalein as will cover a silver 25-cent piece to ten to twelve ounces of methylated spirit, then add sufficient of the solution of caustic soda to render the fluid perfectly of a reddish tinge. In shaking up a little of the mixture with the oil the presence of acid in the oil will be immediately shown by the reddish color disappearing.

THE grade from a gold mill battery, with copper or silver plates leading to the concentrator, may be as follows: The full width plates, 1½ in. fall to the foot; the 16-in. width plates, 1.5-16 in. fall to the foot; the 4-in. sluice boxes, ¾ in. fall to the foot; for single row of machines, 7 ft., total fall from mortar lip; for double row of machines, 9 ft., total fall from mortar lip. The floor on which concentrators stand to be 7 feet below the lip of the mortar for a single row of machines; but if crowded for fall, the concentration box can be sunk or lowered 18 inches. If, however, two rows of concentrators are used, as usual, the floor to be 9 feet below lip of mortar, to bring sluices above attendant's head when standing between the two rows.

UNDER Government auspices the work has begun of deporting needy Yukon prospectors from St. Michael, Copper river and other northern points where they were stranded, partly through their own improvidence and partly through the swindling transportation companies that took their passage money and then dumped them wherever practicable. Some of these companies now refuse to bring them back, but are willing to contract with the Government at so much "a head" to carry the penniless men back to civilization at Government expense. The U. S. gunboat Wheeling and the U. S. revenue cutter Bear have been detailed to take as many as practicable as far south as Sitka. From that point the Government will contract for transportation to Seattle and San Francisco.

REPEATED TRIALS appear to make it manifest that a belt will transmit about 80 per cent more power, with a given tension, when the grain (smooth side of the leather) is in contact with the pulley than when the flesh side is turned inward. It is also claimed that the leather is less liable to crack, as the structure on the flesh side is less dense and the fibers more extensible. The adhesion of belts is greater on polished than on rough pulleys, and is about 50 per cent greater on a leather covered pulley than on a polished iron pulley. Large pulleys and drum may be covered with narrow strips of leather or with longer strips wound spirally. Pulley covers are manufactured in strips of the desired width, and reduced to uniform thickness by machinery. Belts should be kept soft and pliable by applying tallow occasionally, and neats foot or liver oil, with a little resin when they become hard and dried.

AT Bragdon, Shasta Co., Cal., Moore & Saunders save fine gold by sluicing. The boxes shoveled into are 16 inches wide, 9 inches deep, and set at a steep grade, 7 inches to 12 feet. The last of the riffle boxes is 16 inches wide at the top and 32 inches wide at the bottom end. Their shape spreads and throws the gravel so that the gold must touch the blanket riffles, and there it remains. At the bottom the water falls into a V-shaped trough, covered with fine wire gauze or screening, and the fine sand and gold is then carried at right angles from the box into a large tub, the coarse gold falling over outside. The riffles are made of grain sacks. The V-shaped trough and tub are for the especial purpose of cleaning up in, but are left in place all the time for fear that one little

wee speck will not like the carpeting and go on. In the tub the gold settles to the bottom and is easily amalgamated.

TO MAKE concrete for machinery foundations or retaining walls it is advised to use six parts of broken rock small enough to go through a 3-in. mesh screen, two parts of clean, sharp sand, one part of Portland cement, and thoroughly mix together when dry. Do not add any water until it is required for use; then add enough water to make a thick mortar. Mix in small quantities and use at once. Thoroughly tamp with a suitable tamping bar immediately. Concrete will set enough in twenty-four hours to carry a load, and in three to four days will be hard enough to run machinery on. Should broken rock be difficult to obtain, use clean creek gravel of about the same size instead. In no case use loam, clay or very fine sand. For special strength, more cement may be used. This is from cable road practice, and may be considered sufficiently reliable for ordinary use, but for special purposes a special mixture would be required.

AT the 75th meeting of the American Institute of Mining Engineers, to be held at Buffalo, N. Y., on the 15th prox., papers will be read as follows: "Note on the Forms Assumed by the Charge in the Blast Furnace, as Affected by Various Methods of Filling," by F. Firmstone, Easton, Pa.; "The Auriferous Deposits of Siberia," by Rene de Batz, Paris, France; discussion of a former paper, "Mining Districts of Colombia," by Messrs. Granger and Treville, Quibdo, Colombia; "The Ketchikan Gold Mines, Ural Mountains, Russia," by H. B. C. Nitze, Baltimore, and C. W. Purington, Boston; "The Genesis of Certain Auriferous Lodes," by J. R. Don, N. Z.; "The Influence of Bismuth on Brass and Its Relation to Fire Cracks," by E. S. Sperry, Bridgeport, Conn.; "Notes on the Mines of the Frontino and Bolivia Co., Colombia, S. A.," by S. Crago, Mariana, Minas Gerais, Brazil; "Experiments in the Sampling of Silver-Lead Bullion," by G. M. Roberts, Murchison gold fields, West Australia; "Modern Cupola Practice, With Special Reference to the Discussion of the Physics of Cast Iron," by B. S. Summers, Chicago, Ill.

THE "Concentrate" in the issue of Aug. 27, stating that "one miner's inch of water, equivalent to 1½ cu. ft. per minute in falling 100 feet, will generate .24147 H. P.," has elicited dissent from several sources. It is asserted by four correspondents that more accurate data would give .2936 H. P. as the correct figures in the case. It is believed, however, that the statement as originally made will stand. Theoretically our critics are right, but the calculation was made on the basis of an 85 per cent efficiency, which is as much as ordinarily can be got out of that power. One California mining engineer, in his criticism, says: "I find a handy empirical rule to work from is that 100 inches, falling 100 feet, has a theoretical energy of 28½ H. P. With this as a starter one can mentally expand it for varying heads and quantities. I believe the uncertainty of the miner's inch as a unit of measurement has caused more trouble than it is worth, for simple as it is as an approximate measurement I find the average man entirely unable to handle it with even the semblance of accuracy, while to the engineer it is an abomination. I expect some time to see a law here similar to that in other States establishing the second-foot as the legal unit of water measurement."

ENGINEER AYTON of El Bote mine, Zacatecas, Mexico, some time ago carried out a series of experiments as to the best method of producing a thick pulp for pan amalgamation from the pulp of stamps or Chili mills. He found in practice considerable difficulty in getting a continuous thick discharge without occasional blocking up of the pipes when using a siphon, while the disadvantage of a small opening under the full head of the settling box is obvious. The difficulty was overcome by adopting an intermittent discharge. The following arrangement was found to work satisfactorily, and to give a pulp entirely under control as far as consistency is concerned: A short nipple at the bottom of the pointed box was fitted with an outside door valve held in position by a spring, and opened at intervals by a cam movement driven from a shaft. The extent of the opening and the frequency of the same is under control. The pulp collected at the bottom of the box for a short period, and, on the opening of the valve, discharged in a thick flow, the valve being closed so quickly as to prevent its becoming too thin from the rush of water following the first discharge. This method of intermittent discharge is believed to combine the advantages of a comparatively large opening, free from the danger of blocking, with a limited flow of water so that the thickness of the pulp can be maintained.

REGARDING the sizing and cutting of gear wheels, the word "diameter" when applied to gears is always understood to mean the pitch diameter. The diametral pitch of the gear is the number of teeth to each inch of its pitch diameter. If a gear has forty teeth and the pitch diameter is 4 inches, there are ten teeth to each inch of the pitch diameter, and the diametral pitch is 10; or in other words, the gear is 10 diametral pitch. Circular pitch is the distance from the center of one tooth to the center of the next tooth, measured along the pitch circle. If the distance from the center of one tooth to the center of next tooth, measured along the pitch circle, is ½ inch, the gear is ½ inch circular pitch. The diametral pitch given, to obtain the circular pitch divide 3.1416 by the diametral pitch. If the diametral pitch is 4, divide 3.1416 by 4, and the quotient, .7854 inch, is the circular pitch. The circular pitch given, to obtain the diametral pitch divide 3.1416 by the circular pitch. If the circular pitch is 2 inches, divide 3.1416 by 2 and the quotient 1.5708 is the diametral pitch. The number of teeth and the diametral pitch given, to obtain the pitch diameter divide the number of teeth by the diametral pitch. If the number of teeth is 40 and the diametral pitch is 4, divide 40 by 4, and the quotient 10 is the pitch diameter. The number of teeth and the diametral pitch given, to obtain the whole diameter or size of blank of gear, add 2 to the number of teeth and divide by the diametral pitch. If the number of teeth is 40 and the diametral pitch is 4, add 2 to the 40, making 42, and divide by 4; the quotient 10½ is the whole diameter of the gear or blank. The number of teeth and the diameter of the blank given, to obtain the diametral pitch add 2 to the number of teeth and divide by the diameter of the blank. If the number of teeth is 40, the diameter of the blank is 10½ inches, add 2 to the number of teeth, making 42, and divide by 10½; the quotient 4 is the diametral pitch. The pitch diameter and the diametral pitch given, to obtain the number of teeth multiply the pitch diameter by the diametral pitch. If the diameter of the pitch circle is 10 inches and the diametral pitch is 4, multiply 10 by 4, and the product 40 will be the number of teeth in the gear.

The Occurrence of Platinum in the Oural Mountains.

Written for the MINING AND SCIENTIFIC PRESS by
R. HELMHACKER, Prague, Bohemia.

Though this precious metal had been discovered first in Brazil, and occurs in slight quantities also in Borneo, San Domingo, Colombia and California, it is accumulated in sufficient quantities to be economically available exclusively in the middle Oural mountains. This portion of the Oural between the northern latitude of $57\frac{1}{2}^{\circ}$ to $59\frac{1}{2}^{\circ}$, in the government of Perm, is the sole distinct source in the world from which this "noble metal" is derived. The workable platiniferous deposits are only alluvions in which it is disseminated either alone or accompanying the placer gold—alluvial accumulations being extracted exclusively by washing operations like the gold. The platinum alluvions containing sufficient quantities of this metal to be extracted with profit are situated on both sides of the Oural, close to the elevated part or the summit, presenting the features of the watershed of Europe and Asia; the waters from its eastern or Asiatic side contributing to the Trtish, the great left tributary of the Obi stream; while those flowing northward to Europe pass to the Chusovaia, a left-hand affluent of the Kama, and this later a left-hand tributary to the Volga.

On the eastern side of the Oural watershed, beginning in the direction from north to south, are situated platinum placers in the district of Verkhotoorie or the mining district of Goro-Blagodatsk (in translation: district of the Mount Blagodat). The numerous washings are along the headwater branches of several rivers near the Asiatic watershed, thus:

1. One placer on the mining dominion of Bogoslovsk, belonging to Mrs. Tolovcev, drained by the river Sosva, a right-hand affluent to the Tavda, this a left-hand tributary of the Tobol, emptying at left in the Trtish.

2. Two placers on the estate of the Nikolaie-Pavdinsk mining works of Pastukhov and on the Lialia river (Lobva) in the dominion of Vagranka. The Lialia is a right-hand tributary to the above-named Sosva.

3. On the system of the Toora river, with the Nijne-Toorinsk and Verkhne-Toorinsk estates, and its left-hand affluent to the Is, are situated fifty-six placers on the crown land, five placers on the Znamenskaja estate and nineteen placers on other private estates' land. The Toora is a left-hand tributary of the Tobol.

4. More southward is the Salda, a right-hand affluent of the Toora, with three placers.

5. Yet farther south is the Taguil river, emptying at right hand in the Toora, with one placer in the crown's land Koshevinsk, and three placers in the crown's Baranchinsk estate.

All these even-named ninety placers, from which about sixty-six are situated on lands to which the crown once laid claim and granted licenses to private owners to dig for platinum, produce severally each one only moderate quantities, but jointly they contribute about five-eighths of the entire platinum production of Russia, or, rather, of the Oural.

6. Another accumulation of platiniferous character is in the district of Verkhotoorie, on the western or European slope of the Oural, drained by the Ootka river system, in its affluents, rising on the watershed. Here only five works are washing the metal, but on a considerable scale, contributing about one-fourth of the entire output in Russia. These five works are situated on the large dominion of Nijni-Taguilsk (Nijni-Taguilsk is a railway station 335 versts from Perm to Yekaterinbourg), belonging to the heirs of Prince Demidov, in the vicinity of the iron smelting works of Veosimo-Shocitansk and Veosimo-Ootinsk, on the Ootka river, a left-hand tributary of the Chusovaia. The geological features are represented by Devonian crystalline limestone and metamorphic micaceous sandstone, and by Silurian slates of greenish color, sometimes argillaceous or chloritic, in which enormous masses of the earliest eruptive rocks are deposited; thus olivine gabbro, olivine and their transformations into serpentine, or diorites, diorite porphyries, pyroxene (Ouralite), porphyries, Ouralite gabbro, amphibolitic rock, gabbro, tuffas with green serpentinous, chloritic or talcous slaty rocks, derived from them by later peculiar processes. The platinum alluvial deposits are situated in this district on serpentine or the adjacent rock. If all the platinum placers on both sides of the Oural's watershed situated in the Nijni-Taguilsk dominion, worked by the landlord and private owners, are taken together, their production reaches about one-half of the bulk of the entire output of this precious metal in Russia.

7. In the Biser estate of Count Shuvalov are the lands of the Krestovozdvjenskii mining and smelting works, near the railway station of Tiophaigora, 223 versts from Perm—several platinum placers, covering a Devonian ground consisting of dolomites, quartzites, shales, chlorite schist and olivine diallage gabbro, partly decomposed to serpentine. These metalliferous alluvions are situated along the banks of headwater river channels running to the Vilva and Koiva, two right-hand tributaries of the Chuso-

vaia. This occurrence on the western Oural side is situated in the district of Perm, in the government of Perm, and is a good producer, affording about one-eighth of the platinum output.

8. In the Solikamsk district of the government of Perm—Solikamsk is situated on the Kamo, north from Perm in a straight line about 190 km.—are placers producing a small quantity of platinum.

Besides these two systems of placers on the eastern and western slopes of the Ourls no other workable deposits are recognized, and in 1894 the following were in operation: Seventy placer mines on crown or estate lands worked by private owners, eighteen placers situated on private estates and worked by their landlords, and seven placers in private dominions, which means former crown possessions given as a donation (possession estates) to some persons by the monarch for as long a time as they would smelt iron in their works.

The annual production of platinum is now very formidable on account of the attention directed to the metal, and amounted in the year 1895 to 4416.5 kg. and in 1894 to 5209 kg. The long-continued rains in 1895 did not permit washing through the whole season. During the decade 1885-95 the average yearly output was 3570 kg. and the preceding decade, 1875-85, 3145 kg.

The greatest producers are the five placers of Prince Demidov, with 1035 and 1294 kg. in the years 1895 and 1894; then follows Count Shuvalov's with 647 and 655 kg. from his Krestovozdvjenskii placers, both on the western slope of the Ourls. The other ninety placers do not produce, each taken by itself, notable quantities of this metal. Thus the production of about 100 to 130 kg. annually is reached only in each one of three placers; 50 to 100 kg. is produced in each one of twelve placers, while 15 to 50 kg. is extracted in each one of about thirty-three placers, and the other placers average less than 15 kg. of platinum annually.

With the exception of only three placers in the system of the headwaters or its affluents of the Toora river, which extract exclusively platinum, all the other placers contain either the platinum, associated with the prevailing gold, or the gold associated with the platinum as accessory metal, being commonly worked for gold and platinum together; while the other numerous placers scattered in the alluvial district, extending through the platiniferous region on both sides of the Oural summit contain only pure auriferous deposits. The eleven placers with gold and accessory platinum are extremely fluctuating in their yield of platinum, this latter metal forming 1 to 1.33 part of the gold tenor of the metalliferous sands. In the other, about eighty-three platinum placers in which also gold is met with in the gravel, the tenor of the accessory gold presents a variance in its yield from $\frac{1}{4}$ to 1-1100 compared with the yield of platinum, taken as one.

In the most productive platinum (gold) placers in Europe worked by Demidov the precious metals extracted is a mixture of about $6\frac{1}{2}$ parts of Pt with 1 part of Au; those in the Biser estate (Krestovozdvjenskii mining land) operated by Shuvalov produce precious metals in the proportion of 31 parts of Pt to 1 part of Au.

Beside the platinum in some gold placers of the Oural other precious metals of the platinum group are met with, but in exceedingly slight quantities; thus the alloys, or rather combinations of Tr and Os, forming what is known as osmium-iridium, osmeiride, and the trid-osmium, iridosmine, termed in the mineralogie as nevianskite TrOs_4 , and sissertskite TrOs ; the names are derived from the two localities in the eastern Oural, where they were first observed.

In the Oural gold placers of the government of Orenbourg, generally in the crown estate of Mias, these rare metals accompanying the gold were extracted in the insignificant amount of 4.5 kg. and 4.1 kg., in the years 1894 and 1895. This rare metal forms the 1-200th to 1-210th part of the gold they accompany, this later taken as 1.

Beside the two native combinations of iridium with osmium, the nevianskite TrOs_4 and the sissertskite TrOs occurring both in minute flat (hexagonal) scales of dull steel gray to tin white color, is occasionally found also native, nearly pure iridium and very seldom native palladium among the small grains of native platinum. In some rare gold or platinum-gold placers, but more abundantly in the Krestovozdvjenskii alluvions, small diamond grains are found with the precious metals.

The banks of gravels and sands with the platinum and the accompanying gold mostly in the beds of the small streams, or the valley bottoms, also on hillsides where ancient water courses are supposed to have been, are from $\frac{1}{4}$ or 1 m. to $2\frac{1}{2}$ m. thick; their thickness is seldom lesser nor greater than the figures here given. The platinum-auriferous beds of the thickness just assigned are always found beneath barren or non-metalliferous accumulations of debris of rock, as of sand or gravel; or of banks of rock-debris covered with a more or less thick stratum of peat forming the soil of the vegetation. When this is the case the uppermost stratum of peat is resting on an impermeable stratum, which may be even thin, of tenacious clay. In the northern region of the Oural placer deposits these barren covers are $2\frac{1}{2}$ to

3 m. thick, while in the middle Oural deposits they reach the thickness of 10 to 14 m. In the first case, when the deposits lie shallow this barren alluvial layer is dug mostly in the winter season in the open air and transported to such places beneath which lies no metalliferous gravel. The precious bed thus laid open is worked in the summer season in the open air and washed. In the second case, when the barren cover is a thick one, the platiniferous gravel beneath them is worked underground throughout the whole year by shallow pits, from which, with a pannetwork of drifts, the gravels are dug and hoisted to the grass from where they are worked in the summer season. It may be stated that the greater part of the shallow metalliferous placers are richer in gold and poorer in platinum, while those in the region of thick barren covers differ, as they are more valuable in platinum and poorer in gold.

The platiniferous placer with its extractable layer is commonly lesser charged with loamy or argillaceous matters, which have generally not a tenacious character, as this can be observed by some auriferous placers; therefore the assemblage of worn coarse gravel with shingle and fine sandy sediment being more loose, falls to pieces more readily in the washing process. The washing operation is the same as in use in gold washing; the more readily disintegrable bed is reduced with jets of water in perforated revolving drums by stirring them to a loose coarse and fine, sandy and muddy mass, from which the heavier particles (Au, Pt, magnetite, chromite, zircon, etc.) are left behind riffles, when they are carried in a water flow along the bottom of the washing sluice. If not noticing the yield of gold the caught platinum is generally fine grained or small flattened and there is a difference observable. While the mostly equal platinum granules from the Is river and northwards of this left affluent to the Toora are water worn, smooth, and very glistening, the metal from the Taguil system and southwards is dull in color, and slightly associated with the very rare metals (osmium-iridium) accompanying it. Coarser pieces of platinum are more rare, pebbles of the size of a pigeon's egg or yet larger are very seldom and only occasionally assume considerable dimensions. Thus in the year 1827 an irregular lump weighing 4.3 kg. was extracted. The largest nugget ever found—in the Demidov placers—weighs 7.8 kg. The crystalline form of platinum as found native is that of the octahedron or cube, but small crystal-shaped detached pieces of it occur very rarely among the minute water-worn grains of this metal in the placers.

In the year 1894 were washed on the ninety-seven placers in operation exactly one and two-thirds millions tons metalliferous debris, gravels and sands, with 5546 engaged workmen. The average yearly tenor of platinum in the metalliferous sand extracted amounted to 3.08 grams in one ton, by which the yield was fluctuating from 12 grams in the maximum to 2.6 grams in the minimum. The first figure is relating to placers with abundant platinum and accessory gold, the latter to placers in which platinum is subordinate to the gold tenor. The placers on the western slope of the Oural mountains, or the European, bearing more rich in platinum, show an average yearly yield of about 4 to 6 grams in one ton, while the accumulations of more gold and lesser platinum in the bearing alluvions on the eastern side of the mountains situated in Asia show the average annual platinum tenor of about $2\frac{1}{2}$ to 3 grams in one ton of workable sands or gravels.

The extraction of Pt which amounted about twenty-five years ago to only 1500 kg. annually, extended considerably in the last ten years, as the attention of the electrical industry was directed to this metal, which is by no means replaceable by any other. But as the platinum metal was valued only at \$111 per kg., being about thrice the price of silver at that time, only the most yielding or high grade deposits were extracted. Thus the average yield of Pt in one ton workable alluvions amounted in the decade 1870-80 in the Krestovozdvjenskii placers to 16.1 grams (from the maximum 20 gr. to 12.4 gr.), while the Nijni-Taguil platinum washings afforded 6.4 gr., or in aggregate from all the worked placers 6.7 grams. In the year 1887 the average yearly tenor of all the deposits extracted, varying from 19 gr. to .3 gr., amounted in average $3\frac{1}{2}$ gr. per annum to the ton. But as the value of the metal increased slowly to the year 1890 the yield of the workable metalliferous gravels since that time has constantly fallen off to 3.08 gr. in the year 1894, especially since the year 1891, when the metal was valued at \$260 to \$300 and even \$440 per kg. in the years 1894 and 1895. Since the year 1895 the value ranged about \$430 per kg. As by a low value of the platinum only the deposits abundant in metal could have attracted attention, and sands and gravels with more moderate tenors were insufficient to justify mining exploration, such metalliferous beds not proving abundant enough in metal could now pay expenses and minor platinum-bearing regions now attract attention. Therefore, also suspended old placers were re-established as better prices for the metal made washing profitable—hence the decrease of the average tenor in metal in the workable deposits since the value of it had risen. If the platinum would be valued at \$110 per kg., deposits yielding from $2\frac{1}{2}$ to $3\frac{1}{2}$ gr.

metal in one ton, equaling from 51 to 64 gr. in one cubic fathom of gravel, are workable; while at the present price of \$370 to \$440 per kg., metalliferous sands with the tenor from $\frac{1}{2}$ to $\frac{3}{4}$ gr. in one ton, being equal to 13 to 17 gr. in one cubic fathom, pay extraction expenses. In the Krestovozdvijenskii or Biser mining estate is an extended region of such less abundant metalliferous sand accumulations, not yet sufficiently explored, which may in the future contribute to the production of platinum in the country, if the present price of it would retain still longer. Thus the production of platinum in the Ourals from its placers—which is nearly twenty to thirty times the amount derived from the other platiniferous countries of the globe—would continue to cover almost the entire supply of this metal as required for the purpose of manufacture.

The placers in the dales drained by the headwaters of the brooks are worked in claims along the course of the deposit-bearing channels, each claim being $\frac{1}{2}$ km. (5 versts) long, if there is room for that, and at least 500 m. broad. The crown dominions granted to private owners and private estates' land are exempt from the mining regulation on account of claims, as they have the exclusive right of mining in their possessions.

The extracted metal pays a royalty of 3 per cent, which is taken by the Government from the production, besides many other expenses.

Among the extracted platinum were collected, though rarely, specimens consisting of chromite impregnated with the metal, also water-worn pieces of olivine, or serpentine, with abundant platinum granules, so that the attention was directed to the source of it, or to the primary deposit of this rare metal. And as the metalliferous alluvions are deposited on a large scale upon a serpentine ground, it was supposed that this specimen might be the mother rock, from which this metal had been derived by its decay and swept in the gravel strata. Though the assertion that the primary deposit might be attributed to the serpentine was thorough, this fact could not be completed by direct observation, and it was admitted that nothing strictly analogous can be seen on the earth's surface.

But the last 1883 and 1892 discoveries of the matrix of the platinum attracted much attention, resolving thus an interesting question; at first, in the olivine gabbro, forming the ground of some placers in the Biser dominion, where in the structure of this rock are enclosed accessory particles of this rare metal. Near this platinum mother rock—an olivine gabbro without labradorite composed from diallage, some olivine and chromite—beneath the placer formed of yellow-brown sandy loam, of 22 m. width and 4 km. long, are deposited small, detached, sharp-edged grains of the metal with sharp-edged gold, which become more water-worn, finer-shaped and more shining the more distant from the original deposit they are scattered in the platiniferous alluvial strata. Beside this, chromite with embedded platinum the size of a nut is frequent in the placer deposit. Later the mother rock of it was observed in an occurrence of chromite, forming bunches in olivine rock at the Soloviev mountain, $\frac{1}{2}$ km. in a northeasterly direction from the village of Zakharevo, in the district drained by the left tributaries of the Ootka on the land of the Veesimo Chaitansk iron works. The bunch of chromite is impregnated with microscopical particles of platinum, which, by chemical assay, is contained in it at the rate of 106 grams in one ton. But also the olivine rock itself yields traces of this precious metal. In both cases the extent of platinum-bearing primary rock is insufficient to justify mining exploration. Thus the question about the mother rock, of generally small detached granules of the platinum, was at last satisfactorily resolved, as the new discoveries showed it to be embedded originally either with chromite ore, or olivine, or in a serpentine derived from olivine.

The discovery of this precious metal, known from the gold placers in Spain about 200 years ago, was held secret to prevent its admixture to gold in alloys. This metal was first known in Europe in the year 1735, when the Spanish traveler Ulloa received it from the alluvial gold deposits of the river Tinto, in the district Choco, near Popayan, in Brazil; and Wood, an assayer of Jamaica, discovered it at Cartagena in 1741. The metal procured from South America, distinguished by its difficult fusibility, liking to silver, which in Spanish language is termed "plata," received this name, also "platina del pinto," which means "little silver." Most of the producing countries, as Brazil and Borneo, afforded an insignificant yearly output, and it is said that their average yearly extraction amounted to nearly 400 and 120 kg. in the year 1885, while the yield for 1896 might be 70 and 100 kg.

(To be Continued.)

A NEW YORK LOCOMOTIVE WORKS recently turned out a mammoth engine of the twelve-wheeled mastodon type, with cylinders 21 by 34 inches, drivers 55 inches, boiler 78 inches in diameter. Its total weight is 212,750 pounds, and the total weight of engine and tender 308,750 pounds. It is for heavy freight service on the Great Northern railroad.

Ladders for Underground Service.

Following is the result of some recent tests of the strength of various forms of ladders as noted in the *Mining Reporter*:

Fig. 1 is black pine stock, sides, 2x3 inches; slat, 1x3 inches; wire nailed, but not notched. Slat connected like this were capable of standing an average strain of 1225 pounds. The usual manner of breaking is shown at A, where the ends of the slat would split and the nails pull out. The method of testing consisted in placing the ladders at an angle of 45 degrees, and pulling down on the slat or rung by means of a rope and hook. The rope encircled a drum directly beneath the ladder. The dial for registering the pull was connected in with the rope half way between the hook and the drum. The drum was turned by means of crank and gears.

In Fig. 2 is the same form of ladder as in Fig. 1, except that the slats are notched into the sides $\frac{1}{2}$ -inch. The average breakage registered at 1325

1 $\frac{1}{2}$ inches wide and $\frac{1}{2}$ -inch thick. The rungs are iron, 1 inch in diameter. The imperfection in each test was the drawing out of the strips from the grooves, as at E. The rungs would be pulled down, as at F, when strained to only 850 pounds.

A style of aluminum ladder is shown in Fig. 7. The sides are 3x3 $\frac{1}{2}$ inches; rungs 1 inch of same material; metal, 10 per cent alloy; very light, and makes a good ladder for light work. Under pull of 1200 pounds the sides were distorted and rungs bent, as at G, G.

Ladder in Fig. 8, intended for heavy work, has 3x3 $\frac{1}{2}$ -inch sides of bull pine, $\frac{1}{2}$ -inch rungs, and the latter are strengthened by means of a $\frac{1}{2}$ -inch rod, H, which passes through the sides and is headed up outside. When subjected to a pull of 1450 pounds, the rungs and rods would assume the conditions shown at I and J. But this form of ladder is cumbersome. Bolts are more effective in wood ladders for underground service, where the dampness is likely to produce alterations in the wood.

Fig. 9 shows same ladder as in Fig. 1, with bolts substituted for wire nails. A number of bolted slats

pounds. The general character of the break is shown at C and B.

Fig. 3 shows a ladder provided with 3x3 $\frac{1}{2}$ -inch sides, $\frac{1}{2}$ -inch rungs, 12 inches apart, and same stock in sides as above, and hard-wood rungs. Most of the rungs tested in this form of ladder broke, as shown at D, E and F, when strained to 1275 pounds.

Fig. 4 illustrates the bull pine type of ladders, sides 3 $\frac{1}{2}$ inches on flat sides, $\frac{1}{2}$ -inch rungs, 12 inches apart. The rungs in this style broke about as shown at G, when strained to 1265 pounds. In every test the lumber in the ladders was dry, well seasoned and fairly clear.

Among some of the new forms of ladders now used in mining are paper, aluminum and other kinds.

Fig. 5 is a section of a ladder provided with $\frac{3}{4}$ -inch diameter hollow paper sides. The sides are made by rolling manila paper on a mandrel, and cementing and pressing same. A section is cut away to show how the slats are attached. Flanged pins A, A, pass through the shell into the slat. The latter is ash, 1x3 $\frac{1}{2}$ inches, and cut out underneath $\frac{1}{2}$ inches. In repeated tests a number of slats broke as at B, and the pins were pulled out of the shell as at C and D, when strained to 1000 pounds.

The design of ladder in Fig. 6 has met with some success. The sides are bull pine, 3 $\frac{1}{2}$ inches on flat side and grooved to receive a wrought iron strip

broke, as at A, B and C, at a pull of 1250. When the slats were notched into the sides, as in Fig. 9, the slats usually broke, as at D, E and F, at 1325 pounds pull.

The somewhat clumsy form of ladder in Fig. 10 consists of bull pine sides 3x3 $\frac{1}{2}$ inches and steps 3x2 $\frac{1}{2}$ inches mortised and pinned to the sides, as shown. The combination was wrecked, as at A, B and C, when pulled to 875 pounds.

The rope system, as in Fig. 12, was tested to 950 pounds pull on $\frac{1}{2}$ -inch diameter hemp rope, looped and wired as in E. The fracture usually happened as at D.

Unbraced steps mortised into a single piece, as in Fig. 13, broke as at F when pulled to 750 pounds, with the rope hook midway between end and upright. Size of upright, 3x3 $\frac{1}{2}$, bull pine and notched $\frac{1}{2}$ -inch for the steps. The latter are 3x2-inch, also notched $\frac{1}{2}$ -inch. When braced with a wood piece, H, the breaking strain was increased 10 per cent. When braced with a metal bracket, the latter bolted, the breaking strain was increased 12 per cent.

The sides of stepladder in Fig. 14 are 7 $\frac{1}{2}$ x1 $\frac{1}{2}$ inches; steps same width and $\frac{1}{2}$ inches thick, and set into the sides $\frac{1}{2}$ -inch. Hard pine stock. The fracture at A occurred at 775 pounds. When strengthened with wood braces, B, B, the breaking point was registered at 910 pounds.

Electric Transmission From Mechanicville, on the Hudson.

The development of the power of St. Anthony's Falls on the Mississippi at Minneapolis, Minn., is followed by utilization of the power of the upper waters of the Hudson river at Mechanicville, N. Y., where an undertaking of equal magnitude has recently been completed, over 5000 H. P. being available at the power house, the use of high voltage electric current permitting of its distribution over a wide territory. As in the Mississippi, the waters of the Hudson above the present point of development have been employed to some extent, but not until the present enterprise was undertaken had any very serious effort been made to take advantage of the great amount of power which has run to waste for ages down the main waterway of the Empire State. Some time ago the attention of R. N. King, president Stillwell-Bierce & Smith-Vaile Co., Dayton, O., was drawn to this water power, and his experience led him to recognize the possibilities which there lay ready to hand. The site is only two miles from Mechanicville, eleven miles from Troy and eighteen miles from Albany, in each of which towns large quantities of power would undoubtedly find a market. Most important of all, it lay only seventeen miles from Schenectady, where, covering 130 acres, the great works of the General Electric Co. are operated from an extensive steam plant, with which the electrical power from the Mechanicville cataract could readily compete.

The hydraulic engineering features of the development were carried out in their entirety by Mr. A. C. Rice, the Stillwell-Bierce & Smith-Vaile Co.'s chief engineer, and in the complete work as it stands to-day little or no departure from his plans has been made. As the General Electric Co. was the largest customer, its advice as to the electrical equipment was closely followed and the result brought about by the harmonious co-operation of both hydraulic and electrical engineers is a power transmission plant representative of modern hydraulic and electrical practice.

At the point chosen for the development the Hud-

son river is divided by an island into two channels with a combined width of about 1200 feet. The western channel is used for the head and tail race. The power-house starts from and extends into the river 215 feet, and is connected with the island by a concrete dam 26 feet above the bed of the river, 10 feet wide on top and 18 feet wide at the base. The upstream face is vertical, the downstream face sloping. This dam is provided with four arched waste gates 4 feet wide, 6 feet 9 inches high. The main dam is built entirely of concrete. The upstream face is vertical, the downstream face curved, with a horizontal apron 14 feet wide, which throws the falling water off horizontally, preventing wash or scour of the top of the dam. The dam is 16 feet high above the river bed, 8 feet thick just below the crest, 16 feet thick through the base and 30 feet thick through base and apron. The dam is set between massive abutments an-

chored to the rock sides of the river bank and island. The eastern is 20 feet long, 26 feet high above the river bottom, 16 feet thick at the top and 34 feet wide at the base; the western abutment is 100 feet long, the other dimensions being similar to those of the eastern abutment. The length of the spillway between abutments is 800 feet. In the western abutment are twelve arched waste gates, each

4 feet wide and 6 feet high, opened and closed by heavy iron hoists operated by rack and pinion. The eastern dam is practically a solid rock wall, considered capable of resisting floods. The power house lies between the west bank and western stream running between the bank and the island forms the forebay 300 feet long. The main tail race is 205 feet wide and joins the main stream 750 feet below the power house. Arched chambers are provided for seven main

THE POWER BEFORE DEVELOPMENT.

THE DEVELOPMENT OF THE POWER.

the short concrete dam and is practically a continuation of the dam. It is of concrete with the exception of the upper walls. The foundations are carried down to bedrock, and the house is carried on heavy steel box web girders resting upon steel I beam columns. The latter are imbedded in concrete walls carrying arches which form the floor of the generator

wheels and two exciter wheels. In the head wall of each main chamber is set a heavy cast iron cower, through which the turbine shaft passes in a water-tight packing box, carrying the ring oil bearing for the shaft. The saving in space effected by the new arrangement of housing and coupling together of the turbines, patented by the Stillwell-Bierce & Smith-Vaile Co., has tended to diminish considerably the size of the power house. A 20-ton crane runs the entire length of the dynamo room. In front of the wheel chambers is a trash rack of steel bars supported on a framework of steel channel and I beams. This rack effectually prevents the access to the wheels of any rubbish or floating material that may escape the boom.

The main wheel plant consists of ten pairs of 42-in. horizontal Victor turbines of the latest type, built by the Stillwell-Bierce & Smith-Vaile Co. of Dayton, O. Each main turbine consists of two pairs of wheels, each of which at the normal speed of 114 revolutions is rated at 250 H. P. The total power of each set of turbines is, therefore, 1000 H. P. Five units are now in position, and two additional turbines will be installed shortly. The head under which the water wheels are operated is 18 feet. The turbines for the exciters consist of three 18-in. Victor cylinder gate wheels, having, at 259 revolutions per minute, a total of 300 H. P. Two draft tubes lead from each main turbine, the forward tube descending straight into the tail race beneath the power house, the rear or upstream curving and flaring downward and outward. Each tube is 9 ft. 6 in. in diameter at the bottom. Two draft tubes are also allotted to each set of exciter wheels, the rear tube 4 ft. in diameter and the forward tube 3 feet. The speed of each set of main wheels is regulated by an electro-mechanical governor, mounted on a platform directly over the turbine shaft, and between the head wall and the generator.

The dynamo room is 255 feet long, 34 feet wide. The ultimate generator capacity of the station is 7000 H. P. in seven generators each of 750 K. W.

THE MAIN DAM AND WASTE GATES.

son river is divided by an island into two channels with a combined width of about 1200 feet. The western channel is used for the head and tail race. The power-house starts from and extends into the river 215 feet, and is connected with the island by a concrete dam 26 feet above the bed of the river, 10 feet wide on top and 18 feet wide at the base. The upstream face is vertical, the downstream face sloping. This dam is provided with four arched waste gates 4 feet wide, 6 feet 9 inches high. The main dam is built entirely of concrete. The upstream face is vertical, the downstream face curved, with a horizontal apron 14 feet wide, which throws the falling water off horizontally, preventing wash or scour of the top of the dam. The dam is 16 feet high above the river bed, 8 feet thick just below the crest, 16 feet thick through the base and 30 feet thick through base and apron. The dam is set between massive abutments an-

room and the floor on which the wheel flumes rest. The walls form a separate and distinct tail race, 22 feet wide, for each set of turbines from which the water may be shut out at will.

The house is divided into two parts by a thick head

UPSTREAM SIDE OF POWER HOUSE WITH FOREBAY.

capacity. Five have been installed and are now running. They are unitooth, three-phase, forty pole, 750 K. W., 114 revolution alternating-current machines, having revolving fields and stationary arma-

poles, each securely fastened by two bolts to the ring. The whole revolves on a shaft 15 inches in diameter, provided with a rigid coupling bolted to a similar coupling on the turbine shaft.

switches, each mounted upon corrugated gerd rubber cones. As these switches are to break current of 12,000 volts, they are tested to break without difficulty currents of 21,000 volts. The switches are without handles. An eye is made in the end of each blade, into which a hook at the end of a stick may be inserted and the switch opened by the attendant from a safe distance. To prevent any dangerous arcing from blade to blade, marble barriers 1 1/2 inches thick, 3 inches long and 12 inches wide from the face of the board are erected between each blade. On the back of the panels are the high-tension fuseblocks, designed for 20,000 volts, also mounted on corrugated hard rubber cones. The fuse of aluminum is held tightly between two clips attached to springs, and as soon as an increase of current in the line melts the fuse, its two halves are instantly pulled apart and the formation of an arc prevented. Each outgoing line is provided with a circuit-breaker or automatic plunger switch, by which contact may be so suddenly broken that arcing is impossible. The lightning arresters are of the G. E. short-gap type, a type used on nearly all of the most important long-distance transmission lines in this country, and proved a most satisfactory protection against damage by lightning. The line is protected by double-pole 2000-volt arresters, giving six spark gaps.

The line from Mechanicville to Schenectady consists of three No. 000 B. & S. bare wire. The circuits are carried on poles 30 to 60 feet long, all 8 inches in diameter at the top. Each pole carries one cross arm, carrying three triple petticoated porcelain insulators. For lightning protection a barbed wire, frequently grounded, runs along the tops of the poles. At the end of the town limits the line is carried down to the ground and connected to three cables of stranded copper insulated by rubber, protected by lead sheet laid in terracotta conduits.

The introduction of this transmitted electrical power into the factory has worked a considerable change. Heretofore all the machinery was driven by electric motors, while the testing depart-

tures wound to delivering to the transmission lines 36 amperes of current at a periodicity of 38 cycles and a pressure of 12,000 volts. By using the revol-

The exciters are placed one on each side of the stairway leading to the switchboard gallery. They are 6-pole, 100 K. W., 125-volt standard, direct cur-

rent machines, with ribbed field frame and ironclad armatures. The switchboard, erected on a gallery on the north wall of the dynamo room, is built up of nine polished panels of marble, each 7 feet 6 inches high, 3 feet wide and 2 inches thick. Of these nine panels, five are used for the generators and two for the feeders; one is the total output panel,

Is Darwinism True?

NUMBER III.

W. S. PROSSER.

A vibrating stretched string was observed to give out a pleasing sound; longer strings gave lower notes; shorter gave higher. These and other ideas finally resulted in the piano: a contrivance only possible to civilized man. It is a product of high mentality, knowledge and great, slowly acquired mechanical skill. Only an insane person would dream of coaxing pianos to grow on trees: or would fiddle assiduously to some frogs, in the hope that the next generation would be able to whistle a sonata from Beethoven. These illustrations are not over-strained. It is more absurd to dream that the marvelous and complex devices for hearing, seeing, feeling, etc., just simply grew. In every human ear are the essential parts of a piano, consisting, among other things, of some 3000 stretched strings (the "fibers of Corti"): the shortest vibrating to 16 impulses per second, the longest to about 8000, the limits of sounds audible to man. We hear no sound unless it accords with one of these fibers. Other beings, with cords of other relative lengths, might have entirely different musical tastes, and hear sounds inaudible to us. As animals have varied needs, they have varied appliances to supply those needs. For instance, insects perhaps need to distinguish between sounds of 7140-7150-7155, etc., or 9,000-10,000-11,000. They probably do not hear thunder and such deep notes, as their bodies are too small for very long strings. The elephant and lion have room in their skulls for cords vibrating to 10-8-6 vibrations. In nature we should thus expect to find a series of auditory appliances, more or less extensive, more or fewer fibers. Now, how did these originate? Vibrations of air produce sound, and must mechanically affect solid bodies, and so animal bodies, which would become conscious of such, if conscious at all. But from this vague consciousness of vibrations of movement (perhaps arising through the sense of touch) to an organized ear, to an intricate mechanical invention for hearing, for distinguishing sounds, and counting the exact vibrations in each, for picking out a given note in a whole orchestra, there is a great gulf. If we go back with evolutionists, from ears with 3000 cords to ancestral ones with 1000-100-10-4-2-1, shall we assume with them that this original one (as only a little one, anyhow, and not worth quarreling over) arose somehow in the misty region of "desire," "environment," or "chance"? To do so is merely to leave the domain of science and wander into the land of imagination. Suppose this first string had been made and used for a time, does it advance one atom the formation of a second string? If so, on what solid known scientific ground, outside of imaginary chance? If at the beginning Mr. Darwin had been made instead of Adam, and with an ear capable of hearing notes of 16, 32 and 64, and the Creator had kindly offered to make any improvements that Mr. Darwin could suggest inside of 100 years, would he have asked for additional fibers of Corti in the ear, and been able to specify the exact lengths required to enable him to hear the buzz of a mosquito's wing, there being no mosquitoes and no such sound known to him? This fancy can only vaguely hint at the numerous absurdities involved. Don't it seem, for a supposed scientific theory, to border on the childish, to say that, by some variation or hocus-pocus, a second string and a third and so on, just happened, and that they each and every one just happened, by chance the usual way, to be of exactly the right lengths? Even as to length, the chance that 3000 would be all just right by accident, or accidental "variation," would be one in billions of trillions. As to the actual production of the various mechanical means for brains, sight, smell, several separate kinds of taste, and several kinds of touch, it must be always borne in mind that these must have existed prior to the perception by the brain of those properties of matter. Else we must assume not only that the mind of man is inherently percipient of matter, which may be true, though unproved and unprovable; but that all animals, even to the lowest, must be also percipient.

All vegetable and low animal forms seem conscious of light, either over the whole surface or in certain spots. Darwinists claim that this vague perception gradually ripened into the perfect animal eye. Suppose a man on the bank of some great river, and anxious to cross. He leans over the edge, holding to a tree. He has gone 10 or 12 inches. Some evolutionists might tell him just to keep going and he would soon be across. All of the imagined starts or steps of progress of evolution are just as baseless and impossible. No one, Darwin, Wallace or any other, has ever (keeping to my figure) given this man a boat or raft to make his crossing possible. The foundation of sight and all the senses, the specialized nerves and their mysterious connection with the brain and mind, must be guessed at; and must be assumed in advance of the eye, ear, etc.,

and in advance of anything on which the animal could possibly base a selection. Not only these nerves, but for thousands of years the budding eye and ear must have been inchoate, must have been so imperfect and rudimentary as to be of no use, and hence totally without influence in development. In the animal eye, the first perception of light seems to be by means of complicated rods and cones, whose manner of action is totally unknown; the perception of taste and smell still farther back in the unknown. Yet we are coolly asked to believe that all these just happened: just grew. The animal eye refracts rays and utilizes more rays from an object and sees farther and more distinctly than insects, which use only a few perpendicular rays; and thus are met the animal needs. The bird sees the insect, but the insect probably does not see the bird till too late. So the birds are fed, while the insect races are kept up by fecundity. Insect and animal eyes are so different in principle that no one claims that they are desirable one from the other, or both from a third. But it is said that they originated independently, but in some unknown way. At what point on the road from nowhere to somewhere between no eye at all and a good eye, the idea of an eye—with a double convex lens, correcting, by both increasing curvature and increasing density, achromatism in a something totally unknown, bending those unknown rays, with muscles for greater bending by greater curvature in that lens, to say nothing of a dozen other devices, all needed to effect vision—was born, and of what parentage, has been exactly determined. That somewhere the idea began its career, would be on a parity with the fancy that somewhere in blank space Adam and Eve, in a canvas-covered wagon, began driving toward the earth and finally tied their horses

show how the operation of natural causes, selection, environment, exercise, or "the inherent power of the organism," can originate a new and novel idea, an invention not previously thought of: can put that idea into bodily form: can begin, centuries prior to its completion and use, a complicated machine, involving knowledge of laws necessarily unknown to any organism existing, and for unknown purposes, as hearing unknown sounds, etc. Until such showing be made, Darwinism cannot claim a footing in real science. It is only the romance of a summer day.

(To be Continued.)

A Great Stone Bridge.

Napa county, Cal., claims the longest stone bridge west of the Rocky mountains. The structure is shown in the accompanying engraving. It consists of three 70-foot arches carried down to bedrock. The center span is 42 feet above low water. The abutments are 6 feet below the surface, resting on bedrock. The piers are 16 feet at their base and 10 feet at spring line, and also rest on bedrock. The arch stones are 3 feet 6 inches deep, 12 $\frac{3}{4}$ inches at crown, and 11 inches at base, laid in cement mortar. The stone used in the bridges is a native sandstone, and is found in abundance near the site. It is extremely strong, having stood a test of 8000 to 12,000 pounds pressure to the inch. There were used in the construction of the last-mentioned bridge 2600 $\frac{1}{2}$ cubic yards of material, 675 barrels of cement, 380 barrels of lime, 55,000 feet of lumber for false work, and 1 $\frac{1}{2}$ tons of iron. The only article pur-

LONGEST STONE BRIDGE WEST OF THE ROCKIES—OVER PUTAH CREEK IN NAPA COUNTY, CAL.

to an apple tree in the Garden of Eden. I have no intention to burlesque; I make these outre comparisons merely to fasten in the mind the absurdities of chance variation: and of deriving something from nothing, a mechanical invention from mindless matter. An oyster could as easily originate the Lick telescope as a vision-giving eye; a piano as an ear. It helps nothing to say that the eye grew part at a time, or to produce an intermediate eye with some of the parts, if that could be done. Each part began sometime, and began as an idea, part of a definite whole, strictly co-ordinated, to a definite end.

A host of other definite and original ideas in animal mechanics tell a similar story. I have heretofore named about seventy such. Even the least of these positively disproves evolution by natural generation or chance variation. Somewhere in the animal series, feathers, wings, etc., began. Previously they were not. Previously those ideas were not.

If evolutionists claim that new devices originate gradually, thus having their beginnings in individuals prior to those who really used them, the absurd consequence must follow that the less an animal knows the more it knows. For every device must have originated, not in the high forms that use it, but in low forms that did not; that eyeless beings of the intellectual status of the oyster invented the eye, which subsequent beings with brains, even man, has not been able to supersede, or even improve on, or even understand.

The theory of separate creations has been usually rejected on the ground that such would involve a series of miracles. Which is the more miraculous and incredible, several creations by a competent and skillful mechanic, or a creation extending over a day or a million years, by a something, totally devoid of knowledge, intelligence or skill? Or that this dumb lowish matter conceives and embodies dozens of the most brilliant and original ideas, and with consummate mechanical skill? If something new comes into the world, it is a creation, whether that creation occupied one hour or a thousand years; whether it was a totally novel animal or a novel part.

The life of Darwinism depends on its ability to

chased outside of Napa county was the cement. The entire cost of the bridge was \$19,980.

Singular Accident to a Hoisting Rope.

At shaft No. 1, Robinson Deep mine, Johannesburg, South Africa, it was recently noticed that the skips which weigh about 2000 lbs., and which are balanced, were not running smoothly. The hoisting engine was stopped and gradually reversed. On reversing, the rope must have become coiled on the top of the skip, until the latter became free from the broken guide which jammed it; and when—having reversed itself—it fell, it did so through the bight of the rope. It would appear that the falling skip, on being checked by the rope, broke the draw-bar short off and fell to the bottom of the shaft. On the rope being hoisted up, it was found that some 400 feet from its end there was a double loop or bow, and that the end of the rope had formed a single hitch embracing the shackle, the thimble, and swivel on the top of the skip. Moreover, some 25 or 30 feet from the end was a hard knot, of which an illustration is here given. The rope is 1 $\frac{1}{2}$ inches in diameter, made of plough steel, and consists of six strands of nineteen wires each, and a hempen center; the breaking load is ninety tons; the weight is 3 lbs. per foot. The rope was untied with some difficulty, but was found at each spot where it had been knotted to be fit for use and is now in operation in the same shaft. Judging by the distance from the end of the rope at which the knot illustrated occurred, the total drop of the skip is estimated to have been about 90 feet.

THE Oroville, Cal., Register says that Butte county is not affected by water famine, and that 100,000 inches of pure mountain water daily courses past Oroville.

Coast Industrial Notes.

—Coffee grown on American soil is on sale in San Francisco.

—It is estimated that the Yakima county, Wash., hop output this season will be 10,000 bales.

—The receipts of the Mexican National railway for the third week in August were \$105,410.92.

—At Pendleton, Oregon, Callahan, of St. Paul, Minn., bought 2200 lambs and 1700 ewes at \$2.25 a head.

—At Ellensburg, Wash., 120 cars have been engaged for the shipment of sheep to Eastern points, principally Chicago.

—The Crow's Nest railway in British Columbia has been surfaced to Bullhead and trains are running to Cranbrook.

—Electrical appliances sold to Mexico in June amounted to \$23,621, an increase of over 20 per cent over the previous June.

—The contract has been let for grading the first four miles of the eastward extension of the Sierra railroad from Jamestown, Cal.

—The Colorado river bottom south of Yuma, Ariz., is annually covered for miles with wild hemp, which is susceptible of commercial use.

—The sugar beet crop tributary to the Watsonville, Cal., factory is estimated at 65,000 tons. The factory started on its autumn run last week.

—Salinas, Cal., is furnishing lime rock for the Watsonville and Spreckels factories. Three quarries have been opened on the Gabilan ranch.

—The custom house receipts for the port of San Francisco for the month of August amounted to \$567,273.49, the largest receipts for a single month in the records of the department.

—The California Cotton Mills, Oakland, Cal., have increased their capital stock to \$800,000. During the last three years there have been expended \$120,000 for new machinery, etc.

—Some time ago the Chilean Government offered a bonus of \$24,000 to any firm or company which should establish an iron foundry in the Republic. Thus far no one has sought to earn this grant.

—Mr. Thomas of Los Angeles, Cal., goes to Honolulu, U. S. A., to raise oranges for local consumption and vegetables, etc., for the United States Pacific coast line during the close season thereon.

—The Santa Fe office has been advised that the steamer Belgian King, of 3379 tons register, has been secured by the California & Oriental Steamship Co. to ply between San Diego, Cal., and Asiatic ports.

—The report of the Northern Pacific railway for the year ending June 30th shows net earnings of \$12,584,347; reserved for continuity of dividends on the preferred, \$3,000,000; surplus forward, \$387,703.

—From San Francisco last week one ship, destined for Liverpool, Eng., carried 42,855 cases of canned fruit, 16,255 cases of canned salmon, 19,418 casks of wheat, 2,826 casks of beans, and 2,726 sacks of beeswax, the cargo amounting to \$234,964.

—The first half of this year shows an increase in Mexican exports to the U. S. of over \$10,000,000. The total exports for the period reached \$15,000,000. Imports showed an increase of nearly \$1,000,000, of which the U. S. furnished over \$600,000.

—A \$4,000,000 mortgage from the Spring Valley Water Works to the Union Trust Company of San Francisco has been filed. The mortgage covers all of the Spring Valley property, and secures 4,000 bonds of \$1,000 each. Attached to the instrument are \$2,000 worth of revenue stamps.

—Enrique C. Creel of Chihuahua, Vice-Pres. of the new Chihuahua & Pacific railroad, Mexico, says that the road needs 2000 more laborers, the labor question being the only one that hampers it at present. Mr. Creel expects the road to reach Guerrero by March of next year, and it will be three years before it reaches the Pacific.

—Eucalyptus oil is being manufactured at Garden Grove, Cal. The crude oil finds a market with some railroads for the polishing of brass work; the refined oil is used for medical purposes. One ton of eucalyptus leaves yields from five to nine gallons of oil which, when refined, is worth \$1 a pound. One gallon of the refined oil weighs eight pounds.

—At Los Angeles, Cal., on the 6th, was a rush at the land office to place filings on the 1,000,000 acres of land thrown open to settlement through the decision recently made in the overlapping land grant cases. The land extends from Pasadena to Tehachapi Pass. Places in the line sold for big sums. People had been waiting in line for three days.

—At a recent meeting of the directors of the Pacific Cable Co. plans were considered for establishing cable connection with the Philippines, the Asiatic coast, Japan and Australia, via Hawaii. Surveys for a duplicate cable via Sitka and the Aleutian islands were ordered. J. A. Scrymser, president of the Pacific Cable Co., will sail from Vancouver for Japan next Monday.

—The total assessment roll of California for '98, as made up from the rolls of the various counties, foots up \$1,180,362,341, an increase of about \$40,000,000 over last year's roll. The following amounts must be raised by California this year: \$2,553,502 for the general fund, \$2,314,963 for the school fund, \$141,435 for the interest and sinking fund, and 2 cents on each \$100 for the State University. The tax levy is 48.8 cents for this year.

—The Secretary of the Treasury has issued a call offering to redeem the outstanding bonds amounting to \$14,004,500 issued to the Pacific railroads. Of this amount over \$9,000,

000 was issued to the Central Pacific, over \$3,000,000 to the Union Pacific and over \$1,500,000 to the old Western Pacific. These bonds will be redeemed at the treasury at a rebate of one-half of one per cent of their face value at any time during the month of September. This is on the basis of two per cent per annum.

—The Interstate Commerce Commission, by a decision in the matter of the passenger rates disturbance of the Canadian Pacific, involving the propriety of differential passenger rates between Eastern points and the Pacific coast, holds that the Canadian Pacific is not entitled to the differential contended for. The case is one of the most important that has been before the commission for a long time, the American railroad lines and the Canadian Pacific having been engaged six months or more in a war over passenger traffic between the East and West.

—Contracts for the erection of a coaling station at Pago Pago have been invited by Commander Z. L. Tanner of San Francisco, who has the work in charge. The commander will not state the amount to be expended, but he says the work will be of a substantial character, and at least a year will be required for its completion. Lieut. Chamber, of the civil engineering department of the navy, will supervise the construction of the wharf and coal sheds. He will also provide for a water supply and take a complete topographical survey of the United States land surrounding the harbor. Commander Tanner says that no fortifications are to be erected.

—It is stated that at last an incorporation will be made of a company to build a railroad through the Tejon, Cal., to connect the S. F. & S. J. R. R. with the Santa Fe route, giving San Francisco another transcontinental route. The cost of the connection is variously estimated at from \$5,000,000 to \$8,000,000. In this connection it is interesting to note some remarks from a Boston business man who has just returned from California, who says:

"One needs to go West at the present time to size up the business situation. New England mill industries are in poor shape, but they must later feel the effect of the Western demand, for the West is prosperous as never before, has money to burn and is chuck full of vim, enterprise and schemes. Furthermore, the West will this time put its own money into schemes for its own development. But what surprised me most was to find the West still for silver. I look to see 500 miles of railroad built in California next year. This means a tremendous development, as there are not 500 miles of railroad in the State outside of the Southern Pacific and Atchison dominions. New Mexico will also add largely next year to its railway mileage, and I shall not be surprised to see an era of railroad construction inaugurated in the United States that may mean many thousand miles added to our present railway system." This is an important matter to coast interests. The S. F. & S. J. R. R. people say that what they are doing is independent of the Santa Fe, that the Santa Fe on being approached declined to act, and that this is solely a California move. They say the line can be built for \$4,000,000. In this column some time ago was noted the intended extension of the railroad running from Salt Lake City, Utah, to Milford, westward toward Pioche, Nev. About 400 miles more would extend that road to Los Angeles, Cal., and it is within reason to assume that the simultaneous action implies an understanding as to connection and future action regarding final junction of the two at Los Angeles. The S. F. & S. J. R. R. people will be in position to do business with either or both the Santa Fe and Salt Lake lines.

The First Water Jacket.

TO THE EDITOR:—You are correct when you say that the late M. W. Belshaw of Antioch, Cal., was the first to use the water jacket. We first used a water tyeure in an adobe firebrick. I made the mould. The clay was found on Cerro Gordo hill, Inyo Co., Cal. The water entered the bottom of the tyeure, emerging at the top. Water cost at that time (1868) 10 cents a gallon. The tyeure worked well. Then came the water jacket, 3 feet around. It was gotten up by the late Ira P. Rankin of the old Pacific Iron Works. Edgbert Judson, M. W. Belshaw and I were then the most successful smelters of silver and lead ores in the State, or, probably, the United States. Lead was worth 6 cents per pound and silver bars were 14 cents premium. The works were at Cerro Gordo, Inyo Co., Cal. That was in 1868. We commenced the use of the water jacket a year later.

A. B. ELDER.

Glencoe, Calaveras Co., Sept. 5th, '98.

Commercial Paragraphs.

On the 1st prox. the Simonds Saw Co. will occupy new and more commodious quarters at 33 Market street, San Francisco.

S. N. KNIGHT & Co. of Sutter Creek, Cal., are casting a pump for the San Francisco Bridge Co., which is to be used on the Oakland flats to operate a 20-inch pipe. Its weight will be about eight tons.

THE Edward P. Allis Co. of Milwaukee has closed a contract with the Timber Peak M. Co. of Philadelphia for the erection of a 150-ton concentrating plant, to be located about twenty miles from Socorro, N. M. The contract calls for a complete mill, including the buildings, which are to be of steel construction throughout. The mill is to be fitted with two rock breakers, six sets of Reliance crushing rolls, twenty Reliance vanners, and the necessary elevators, revolving screens, etc. The power plant consists of a Reynolds Corliss engine of 150 H. P., to drive the crushing department, and a 40 H. P. high-speed automatic engine to drive the vanners. The boilers are of the locomotive type, three in number and of 80 H. P. each.

Personal.

JNO. W. MACKAY is in San Francisco.

ROSSITER W. Raymond is at San Andreas, Cal.

D. WOLF becomes Supt. Ben Butler mine, Bingham, Utah.

GEN. W. S. KEYES has returned to San Francisco from the East.

T. K. CLARK becomes Gen. Mgr. Snow Drop M. Co., Dewey, Idaho.

A. N. BUTTS, Supt. Bovee mine, Altaville, Cal., is in San Francisco.

R. F. RAFFOON is appointed Supt. Holmes M. Co., Candelaria, Nev.

W. C. BODY, a mine operator at Grass Valley, Cal., is in San Francisco.

L. C. PARKE now occupies offices No. 608, 330 Market St., San Francisco.

M. W. KEENEY, Supt. Ohio mine, Greenwood, Cal., is in San Francisco.

W. MAITLAND, Supt. Nash mine, Abrams, Cal., has returned from San Francisco.

S. B. MILNER, Mgr. Dexter M. Co., Tuscarora, Nev., is in Salt Lake City, Utah.

R. ROBERTSON succeeds C. E. Uren as Supt. Allison Ranch mine, Grass Valley, Cal.

C. A. HOLLAND has succeeded M. Berry as Supt. Providence mine at Carters, Cal.

W. J. SUTHERLAND, Pres. Holmes M. Co., Candelaria, Nev., is at Virginia City, Nev.

CHAS. OSBORNE, a well-known California miner, died at Bulwago, S. A., July 10th.

V. B. ALLEN, Supt. Bushman mine, Black Hawk, Cal., has returned from San Francisco.

O. L. BARTON, Supt. Herman mine, Wells, Cal., has returned from San Francisco.

S. J. FLEMING, Supt. Providence G. M. Co., Bigbug, Ariz., has returned from California.

F. W. WILMANS, Pres. Rose Creek M. Co., has returned from San Francisco to Sonora, Cal.

P. T. FARNSWORTH, Gen. Mgr. Horn Silver mine, Frisco, Utah, has returned to Salt Lake City.

SUPT. HONNOLD of the California Exploration Co., Four Corners, Cal., is in San Francisco.

J. S. LARUE of the Triple Alliance mine, Placerville, Cal., has returned from San Francisco.

E. W. HOPKINS, Pres. Gold Hill M. Co., Grass Valley, Cal., has returned to San Francisco.

D. W. BALCH, formerly of the Comstock, has returned from an Eastern trip to San Francisco.

SURVEYOR-GENERAL GLEAVES of San Francisco is spending a few weeks at Shasta Retreat, Cal.

GEO. BLAKE, Supt. Bell mine, Tuttletown, Cal., after a month's sojourn in San Francisco, has returned home.

W. F. ENGLEBRIGHT, managing owner Red Dog drift mine, You Bet, Cal., is in San Francisco from Nevada City, Cal.

R. K. BERRY, owner Greenstone mine at Shingle Springs, Cal., has returned from San Francisco to Placerville, Cal.

S. Z. DICKSON, largely interested in mining in the West, particularly at Creede, Colo., is seriously sick in New Jersey.

CAPTAIN THOS. COUCH, formerly of the Merced mine, Cal., is now in Alaska studying the outlook for copper mining in that region.

T. J. PARSONS, Vice-Pres. California State Miners' Association, has returned to San Francisco from a visit to his mining property in Sierra Co., Cal.

A. P. BRAYTON JR., Vice-Pres. Pelton Water Wheel Co., left on last steamer for Japan and China, to look after the interests of his company in the far East.

J. SIMPSON, Mgr. Eureka mine, Grants Pass, Oregon, has returned from San Francisco, where he purchased a cyanide plant and several concentrators.

CLARENCE SHARON, prominently identified with the Comstock mining interests for the last twenty-five years, has taken up his residence in San Francisco.

A. M. KELLY, who sold the Murphy mines near Tuscarora, Nev., for \$150,000 to the McDermot Bros. of Butte, Mont., and Los Angeles, Cal., is in San Francisco.

THOS. H. LEGGETT, a well-known California miner, has a twenty-three page article on "Diamond Mining in South Africa," in the September number of Cassier's Magazine.

IRVING HALE, a Colorado electrician and miner, who came to San Francisco as Colonel of the First Regt. Colorado Infantry, has received deserved promotion to a Brigadier-Generalship.

F. DASSENVILLE, formerly manager of Baker & Hamilton of San Francisco, has retired from that post. Horace Coffin, well known as cashier for the firm for many years, has succeeded Mr. Dassenville.

PROFESSOR W. B. RISING of the chemistry department of the University of California, has returned from Europe, where he attended the meeting of the International Chemical Association as a delegate from the Pacific coast.

MRS. J. A. STEWART, of Deep Creek, Utah, is an accomplished assayer. The Salt Lake Tribune says she "enjoys the distinction of being the only female assayer in the West." There are others in various western States. In the northern part of California, Miss R. N. Bell of Shasta, is a good practical assayer.

J. V. KEELLEY, a Nevada miner who wintered at Dawson, has returned to California. He says the exaggerations in California newspapers regarding the richness of that region are ridiculous to those who have been there,

and rightly thinks that truthful publicity of California's great mining resources would be more consistent.

E. SNOW of San Francisco returned last Monday night on the Portland. He has been in Alaska and Northwest Territory something over a year. He thinks that the amount of gold brought on the steamer will not reach \$1,000,000, and that most of this belongs to the Canadian Bank and the Alaska Commercial Co. He refers to several persons mentioned in the daily papers as bringing out \$200,000, one of whom has nothing, and another, supposed to have the largest bulk, hasn't \$50,000. When he left Dawson butter was selling at \$1 a can and potatoes at \$50 a sack. There are, according to his statement, 3000 men in Dawson who can get no work, though they have offered themselves at \$7 a day and board themselves. From Dawson to McCormick and Indian creeks hundreds of gravel dumps can be found, which men took out during the winter to wash in the spring, which have produced practically nothing, and the men lost their time and money. He says this is the case, too, in many instances on Bonanza. He predicts suffering and hardship for many who are there, and those who go in, unless provision is made for them, as they haven't means to get out. He is particularly censorious of transportation companies for advocating possibilities not to be found in that country.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey, Strong & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR THE WEEK ENDING AUG. 30, 1898.

610,116.—STAPLING MACHINE—G. W. Ansley, Medical Lake, Wash.

610,013.—WAVE POWER PUMP—J. E. & W. Armstrong, Santa Cruz, Cal.

610,122.—ROCK BREAKER—F. H. Cook, Spokane, Wash.

610,155.—SASH LOCK—R. D. Duff, Tacoma, Wash.

610,057.—FOLDING BED—F. Jensen, Seattle, Wash.

609,905.—SEED DRILL—Porteous & Cole, Fresno, Cal.

609,999.—COOLER FOR ICE MACHINES—R. F. Schroeder, Sacramento, Cal.

609,978.—FOUNTAIN PEN.—H. J. Schulte, Los Angeles, Cal.

610,008.—FISH HOOK—C. J. Sly, Klamath Falls, Or.

609,918.—GLOVE FASTENER—J. Steinberger, S. F.

609,850.—PLOWS—Twomey & Mills, Anaheim, Cal.

609,863.—STAMP MILL—G. Wood, Prescott, A. T.

NOTE.—Plain and Certified Copies of U. S. and Foreign patents obtained by Dewey, Strong & Co., by mail or telegraphic order. American and Foreign patents secured, and general patent business transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

PRELIMINARY COOLER FOR ICE MACHINES.—Richard F. Schroeder, Sacramento, Cal. No. 609,999. Dated Aug. 30, 1898. This invention

relates to an apparatus for cooling water previous to its being introduced into the freezing cans of ice machines where it is finally frozen into blocks. It is necessary after the air has been expelled from water previous to freezing that it should be frozen as rapidly as possible to prevent re-absorption, and my apparatus serves to reduce the temperature to nearly or quite freezing point before the water is introduced into the freezing cans. It consists of channels through which the water is conveyed to the freezing cans, a cold brine supply above the same, a directing apparatus between and in line with the channels in the brine supply for discharging cold brine upon the channels while the can is being filled, and means automatically controlled by the flow through the channels for throwing the directing apparatus out of the line therewith and with the brine supply so that the discharge is diverted while the flow in the channels is temporarily arrested so as to prevent the water being frozen in these conducting channels instead of after having been introduced into the cans.

WAVE POWER PUMPING APPARATUS.—John E. & William Armstrong, Santa Cruz, Cal. No. 610,013. Dated Aug. 30, 1898. The object of this invention is to utilize the motion of the waves to actuate a pump. The pumping apparatus is fixed in a vertical well which may be made in a cliff at a distance from the front where such a cliff exists, and from the bottom of the well a flaring or diverging passage extends outwardly to the front of the cliff and below the surface of the water outside. Within the well is a float suitably guided and adapted to rise and fall by the rise and fall of the water within the well. This float is connected with the pump so that the latter is actuated by it and by suitable conducting pipes water may be carried to any reservoir or point desired. The divergent mouth of the passage presented to the waves of the sea concentrates the latter into the well so as to largely increase the rise and full therein, and the float will thus be moved over a much greater distance than would be due to the absolute rise and fall of the waves.

Recently Declared Mining Dividends.

Grand Central, Utah, \$31,250; Sept. 10.

Swansea, Utah, 5 cents per share, \$5000; Sept. 10.

Crown King, Arizona, 2 cents per share, \$12,000; Sept. 1.

Pennsylvania, California, 5 cents per share, \$2575; payable immediately.

Calumet & Hecla, Michigan, \$10 per share; payable Sept. 30.

Mining Summary.

ALASKA.

W. De Varila, M. E., Deputy U. S. Geological and Mine Surveyor, has returned from the Klondike, and says precisely what this paper has been publishing regarding that region. An interview with him sounds like a summary of this paper's utterances since the last "rush" northward began. He says he has spent three years there, and that the Klondike is a good place to keep away from. While a few men stumble upon the gold very many waste their energies and exhaust their means in a vain endeavor to find gold where there is none. The Klondike, says Mr. De Varila, and by the Klondike is meant all the auriferous territory on the Yukon, is more of a gamble or speculation than any other placer country probably in the world, because it is so uncertain. It is not, Mr. De Varila contends, a true placer country and therefore the gold is not well distributed. The placer gold of the Yukon interior he holds is the product of erosion or of now extinct or ancient glaciers, carried down by them from unknown fountain heads and left in the crevices, gulches or depressions found on bedrock. This is a matter for subsequent development, and has been discussed scientifically herein. The uncertainties of the Yukon, Mr. De Varila insists, are too great for the average man to undertake mining up there, no matter what part of the country he may locate in. Again, he says that too much is being made out of the success of the few and too little notice taken of the large majority who return unsuccessful, which is manifest.

After having read some recent accounts of rich Klondikers who have returned and are to return, he felt it incumbent upon himself to enter his protest, and that most emphatically, against the misrepresentation of some papers and of the miners themselves in a good many cases. Mr. De Varila was at Dawson and took pains to secure accurate information in regard to the output of gold. From what he was able to learn he does not believe that above \$6,000,000 will possibly come out or is there to come out. His main protest, however, is not against the statements of large outputs, but against the delusion into which men all over the country are being led and induced to go there. Mr. De Varila says that out of the 1700 claims worked in the Klondike section not over forty on El Dorado and twenty on Bonanza paid for the working, or paid for the fuel consumed. He says wood costs \$100 a cord and wages \$15 a day, that the cost of sinking a shaft is at least \$15 a foot, so that a man can run through a small fortune in a very little while and if he is not lucky in his first venture to bedrock he finds himself a poor man in the most inhospitable country on earth for a poor man. It is simply suicide, he says, for any man to go into the country to prospect with less than two years' supplies.

Mr. De Varila left Dawson July 23rd, and at that time there were 2500 boats lined up along shore with the owners—mostly men whose future was very uncertain. The country is staked for seventy miles out of Dawson and it is the same with the lower camps. Every claim thought to be worth anything on Koyuk river for 600 miles is staked already, and yet there is not that liveness at any of the new or revived diggings that has been reported. One could travel for miles and miles on Forty Mile and other streams without seeing a soul.

Mr. De Varila talks differently from most men who have been reported as saying anything. In short he believes that the bottom has dropped out of Dawson and he expects to see 6000 people hustle themselves out of there this fall. He says he saw George Carmack, the famous Bonanza discoverer, who arrived on the Roanoke, when he was at Fort Get There, and knows what money Carmack and his two Indian brothers-in-law who are with him have between them. That sum is \$35,000, representing several months work, yet Mr. Carmack has been reported as coming out with a million. He knows of others who have been reported as bringing out much gold whose sums have been grossly over-stated. It is this that is leading too many people to their financial ruin in the Klondike and testing their vitality. He knows that there are hundreds of men now in that country who haven't the price of their fare home and he can see no other way for it but Government help to get them out of it.

Mr. De Varila talks of the mineral characteristics of the country as a man thoroughly familiar with it and assigns his reasons at every stage why the gold cannot be generally found. He has been exploring the country all the way from Yakutat Bay to Fort Hope, above Bering Straits. The whole region from White Horse Rapids to Nulato is of the same general characteristics, so far as the auriferous showing goes. No true rim rock is ever found and none of the usual indications of a genuine auriferous deposit. The entire bedrock is hummocky and disappointing. It may be found 30 feet from the surface or it may crop out almost at the grass roots. The country is alluvial granite, without the characteristics of slate, schist, talc, porphyry or the usual indications of gold bearing.

At the present time Little Munook gives the most promise and is the most active of any of the camps.

Work is being conducted at the placer mines of Silver Bow basin operated by the American G. M. Co. with satisfactory results.

Near Cook's Inlet, the Bear creek mine in the Turnagain Arm district, is sold to O. H. Sleeper, of Exeter, New Hampshire, by G. R. Beedy of Seattle for \$25,000. This mine consists of five and one-fifth claims covering 7,300 feet in length of Bear creek, with a width of 580 feet or 104 acres of land. This creek produces coarse gold on bedrock. It is

Mr. Sleeper's intention to work his mine on a large scale with improved machinery.

ARIZONA.

The Oro Plata, Mohave county, has eighty tons of ore on the dump that will go \$100 in gold, besides silver and lead.—The C. O. D. mine, Mohave county, will soon begin to furnish ore to the market. A high grade of concentrates is being turned out.—Bent & Lamson of Tucson have sold their Centennial group of mines in Gujias mountains to a Michigan company, headed by F. A. Smith. The group consists of eleven claims, which will be developed immediately.—The Moody & Place group of mines near Crowned King, Yavapai county, has been bonded to E. E. Breed, who has begun development work. The present force will be increased as rapidly as possible, and as soon as the property is sufficiently developed a mill will be erected.—The Elkhart mine at Chloride, Mohave county, is idle, the steam hoist having been burned recently. A hoist of greater capacity will be erected at once. The Elkhart has large bodies of ore. A 100-ton concentrator is on the property.

The Franco-American Co. at Oro Blanco is pushing work and the mine is producing high-grade ore.—On the Tres Amigos mine at Oro Blanco the ore is getting better as sinking progresses.—Cornelson & Co. have sold to F. E. Canda of New York their interest in the wolframite claims at Russellville for \$3500.

CALIFORNIA.

Amador.

Dispatch: At the South Eureka mine, Jackson, work continues in both shafts and at the mill. Electric power has been in use at the mill for months, and immediately the water began to slack off, the engines, which were already in place, were attached, and work was not delayed. Reports from the South Eureka continue encouraging.—The north shaft at the Kennedy mine has been idle for two weeks, owing to lack of power to run the hoist, but the machinery was started last week and work is going on again in the north shaft. The mill is running only fifteen stamps, but the number will be increased now that all the water power can be centered at the mill. Work is going forward at the south shaft, and has not been interfered with there, as steam power has been in use for several weeks.—Teams are again hauling quartz from the Oneida mine to the Zeila mill for crushing. The first crushing of 100 tons yielded over \$4 a ton. The Oneida ledge is large and the shaft and machinery are so arranged that the ore can be mined at a profit at this figure.—The Potazuba M. Co. at Sutter has had 147 tons of rock crushed at the Zeila mill, which yielded about \$4000—\$37 a ton. The management is still taking out rock of the same grade.—At Sutter there is very little activity in mining, owing to the shortage in water. The Lincoln is going ahead, and work progresses night and day on the new Wildman shaft. This is down 250 feet, and is still in hard greenstone.

Ledger: At the Jackson Exploration and Development Co. at Jackson, sinking under contract is progressing as rapidly as the scarcity of water will permit.—Mr. Bryson of Stockton has taken hold of the Bay State mine at Plymouth and will unwater it preparatory to making an investigation of its value.—The Argonaut—Kennedy, Jackson, suit is set for the 15th inst. in the Superior Court of San Andreas, Judge Nicol of Tuolumne presiding.—The Ivanhoe, or the old Wheeler mine, at Plymouth, has added fifteen stamps, making its milling capacity twenty stamps. They have started a shaft and erected a new hoist.

Republican: During the idleness of the Keystone mill at Amador City a great deal of repairing is being done. About twenty men are now employed.—The Amelia mine at Jackson shows the usual activity, with prospects improving.—The Anita is still in hard rock, but there is no cessation in the work.—A good body of rock has been found in the Valparaiso mine. The prospects are considered good.

Butte.

Two new dredgers are under construction for use on the Feather river between Biggs and Oroville and another will be begun shortly.

In the Mt. Ida quartz mine near Oroville development work is continued and a good quality of ore is on the dump awaiting the irrigation season to close to start up the mill.

Calaveras.

The Santa Ana mine, near Angels, will start up soon with new machinery.—J. Maltman has leased the Angels mine. Development work has begun.—A large force is employed at the Thorpe mine grading for the new mill.

W. B. DeWitt has taken a bond on the Machu mine at West Point for \$10,000. The agreement under which DeWitt takes possession is that he is to erect within a year a mill of no less capacity than five stamps and to employ due diligence in developing the mine and one-fourth of the gross returns of the mill to be applied as often as there is a clean-up.

The pump at the Stickle will be kept in operation to keep the Utica and Stickle mines freed from water pending the cleaning and enlarging of the Union ditch. The mines that are running by steam power will continue operations. The Lightner mine will install electrical power in a short time from the California Exploration Co.'s wires.

In the Demarest mine near San Andreas a strike was made last week on the 200 level of a ten-foot ledge said to run \$45 a ton.

El Dorado.

In the development of the Gold Bug mine in Placerville ore has been found of high grade. A mill site has recently been bought in addition to the two claims and the building of a mill is contemplated.—The Triple Alliance Co. operating a gravel property near Pacific House, found their property adapted to hy-

draulic rather than drifting. They will build a dam and put on machinery. The property is operated by Kimble & Co. of Placerville.

Kern.

At Randsburg the Little Butte is sinking and has the same body of sulphuretted ore, which mills \$16 in free gold. They are down 500 feet, and are sinking a new air shaft 200 feet from the main shaft. The 2-stamp mill has averaged since it started about \$5000 in bullion per month. The company have about 150 men on their payroll, including the men at the wells.—The cyanide works have started and three tanks have been filled.—The monthly clean-up of the Yellow Aster M. Co. at Barstow was made last week for August and resulted in \$42,000 of bullion, \$105,000 for July and August.—Work will be commenced on the O K mines Sept. 15. The development work on the Black Hawk has done much to show the value of the O K and the O K No. 2.

Nevada.

The Pennsylvania M. Co. at Grass Valley, at a meeting of its directors held Sept. 2, decided to add ten stamps to its milling capacity.

At the Texas mine near Nevada City, which had been idle for years, and on which a San Francisco company resumed work about a year ago, at 250 feet depth a ledge 7 feet wide has been found. It is locally reported that a 203-stamp mill is soon to be built. F. Korbel, 203 Battery street, San Francisco, is president of the company.—From the Mountain Maid mine near You Bet station good ore is being taken from the 100 level. The property is owned by the Pierce estate.

On the 15th inst. it is quite probable that every mine in the Grantville district running by water power will temporarily close down, as the water company intends to repair its ditches, and besides this there is a shortage of water. Among the mines to suspend are the Spanish, California and Mineral Hill.

The Mineral Hill mine near Washington has milled ore which pays \$50 to the ton. With only a 2-stamp mill the mine has been producing over \$100 per day, the ledge being of good size, and the ore has indications of permanency.

Herald: In the Live Oak and Minuet mine, Columbia Hill, work is progressing. The ledge is large. The ore is free milling, and there are considerable sulphurets. Supt. McMahon has fifteen men employed.—At the St. Gothard, also in Columbia Hill district, work is pushed with success. The ledge is a large low-grade property so far as developed.

Placer.

At the Hatheway mine near Auburn a large amount of development work has been done. The 200 and 400-foot levels are in a distance of 900 feet, and the 600 level is being driven rapidly. Twenty-four men are employed and ten stamps are run during the day and fifteen at night. A new ditch has been cut and the water power will be greatly increased when the pipe line has been extended up to the ditch. A. B. Eastwood has been superintendent of the mine for five years. Supt. Sullivan of the Pioneer gold mine reports that, in doing exploratory work in the south end of No. 4 tunnel, an entirely new vein of ore has been struck. When first encountered it was only 24 inches wide. It has since widened to 3 feet and is still broadening.

Plumas.

At the Bushman quartz mine near Quincy work will be resumed without delay.—Near Johnsville the Four Hills mine will install electric power and build a mill. The success of their development has proven satisfactory.—Supt. Cheyney says the Jamison mill will have sufficient water supply to continue work the present month.

At Franklin hill several companies are drift mining with good success.—At Sprout hill an Oakland company is developing a quartz property.—On Kellogg creek the Von Leicht mine is building a cyanide plant. Fifteen men are employed in the mine.

San Diego.

The Ranchita mine, near Banner, of which C. J. Coutts is principal owner, will erect another and larger mill on the property. One difficulty at the mine is lack of water, but this can be remedied in a short time. A tunnel is being driven 14 feet under the old water tunnel to tap some big springs up the valley, and it is believed this will furnish water to keep the mill running twenty-four hours a day.

Shasta.

Near Whiskeytown, in the Manlove Treasures mine, at a depth of 120 feet, a 6-foot ledge produces free-milling ore that runs \$15 a ton.

The Milkmaid mine, at French Gulch, has resumed operations after a shut-down of several months.—Development work on the copper mines at Stillwater, which is being done for Lewisohn Bros. of New York, is going steadily forward. Two shafts have been sunk on the property. Native copper has been found in small quantities.

Sierra.

At the Gold Bluff mine near Downieville a new steam hoist is being placed and sinking will be resumed without delay.

Slakiyou.

Journal: The miners along Klamath river are all working day and night and all seem hopeful of doing well before the season closes. The Pacific mine is in working order again since the filling up from an old drift. All the Chinese companies are busy as though doing well, but it is impossible to get anything from them as to their success.—The Cherry Hill mine on Cherry creek is prospecting well. Considerable quartz is being taken out and the claim put in shape for the winter season, when a quartz mill is to be built. H. H. Hunter & Co. are the owners.—J. Ironsides has been finding good quartz on Cherry creek.

Reporter: At Quartz valley a new ledge on the lower level of the Little Queen mine has

been found of good ore. The mine is employing fifteen men. It is locally reported that about \$25,000 has been taken from this mine since January.—Owens & Co. have cut the ledge and are stopping ore which runs \$75 a ton.—The dredger operated on the Klamath at Oak Bar by Distelhorst & Barton closed down last week on account of low water. They are reported to have had a successful run.—In the Volcano mine an incline is being run on the ledge from the 410-foot station and a force employed on the upper levels stopping ore to supply the 5-stamp mill which is running night and day. The general condition of this mine is very good.

Journal: Gardener & Souther, prospecting Yreka creek bed, have nearly completed their work of making a continuous test of all the basin from Shasta river to Yreka, and will probably put in a dredger plant.—W. L. McClaghry, who has been running a tunnel for nearly four years past to strike the ledge on the north fork of Humbug, struck it last week and it prospects well.—The American Bar Co. at Ash creek is crowding work day and night with a large force, and it is believed the claim is paying well this season.—The Manzanita Bar claim in the Virginia Bar district is reported paying well, the owners having found a rich channel at bedrock.—Work at the Pacific mine at mouth of Humbug creek in Klamath river is progressing.

Trinity.

Near Abrams, Norton & Frue of San Jose have twelve men at work on their ledge. They have two shafts down. Their vein has an average width of 5½ feet, and an average assay value of \$50 per ton so far.

The Altoona mine at Cinnabar last week shipped 100 flasks of quicksilver. The output is 500 flasks a month.

Journal: J. A. Edwards of the New York M. Co. is sinking prospect shafts on the land of Clayton & Blakemore along the Trinity river in Lewiston. If the gravel prospects sufficiently it is the purpose of the company to put in dredgers.—The LaGrange mine has shut down until water comes.—C. S. Childs has an option on the Minersville, Rowles and Italian gulch placer mines in the Minersville district, and has placed a crew at work prospecting the property. If results are satisfactory operations will be begun on a large scale.

Tuolumne.

(Special Correspondence).—The effects of the dry year are being severely felt among the mines in this county as in the rest of the State. All the mills are shut down and but little work is being done in any of the mines along the mother lode or higher up about Sonora. Never before in the history of the county has the water supply been so short. Even at Sonora the supply has been cut off a part of the time. Irrigation has necessarily almost stopped and the frequent forest fires show how dry everything is.

Such a dry season may not occur again for many years, but it will occasionally come and the condition of things most forcibly draws attention to the great waste of water with the present system of water ditches. The loss is so great that even with the present dry season the condition is much worse than it might be. It is generally asserted that the loss from open ditches is small, that an impervious layer of mud is formed upon the bottom. When, however, one follows the main ditches to their distributing points and traces the small ones which wind for miles around the hills where the soil is shallow and numerous ravines to be crossed, it does not take much observation to see that in connection with surface evaporation the loss amounts to a very large percentage of the total, and in the present year the waste from such sources is sufficient to make the difference between almost utter lack and a fair supply for the most important purposes of mining and agriculture.

One cannot follow a ditch for more than a quarter of a mile at most any point in its course without noticing the leaks of greater or less size due to various causes, some of which might be prevented, others not owing to the nature of the conduit. The introduction of a new system of iron pipes or cement ditches must necessarily be expensive, but it seems that some such method must ultimately be adopted before this foothill region can be reasonably developed, either in mining or agriculture.

At present a large electric plant is being installed a few miles above Sonora from which it is expected to conduct electricity to the important mines, thus doing away with the necessity with so much water for mining purposes, and another dry year will find the mines much less affected. This enterprise does not lessen the necessity, however, for a greater economy in the distribution of water. All the important sources of water supply are said to be utilized at present and with the development to which this region is capable, many an ordinary year will find the supply short under the existing circumstances of distribution.

No better investments can be found than that of water systems along the Sierra foothills traversed by the mother lode, if they are properly developed, but under the old time management as it exists in some of the counties the water supply is not properly stored and in addition a very large evaporation of that saved is lost later through evaporation and leakage along many miles of the small distributing ditches.

Sonora, Cal., Sept. 7th, '98.

Of the quartz mills in the county six are in operation, four on the east belt and two on the mother lode. The others are waiting for rain.—The big dam of the Tuolumne County Water Co. at Lyons' Flat will be completed within two weeks. Another is being built, while extensive repairs are simultaneously being made on the remaining three belonging to the company.—The Horse Shoe Bend M. Co. at Columbia are running a tunnel to tap the ledge at considerable depth.—An additional twenty stamps will be added to the

Shawmut mill, Jacksonville, in the near future, making a total of sixty.

The *Democrat* says river-bed mining in the Tuolumne river is now carried on to better advantage than ever before, as the river is so low. A company of Chinamen are credited with realizing fifty pounds of gold in a clean-up last week. They are mining in the river bed above Jacksonville.

Yuba.

Unwatering the Pennsylvania mine at Brown's Valley has reached the 800 level, and stoping was begun last Monday.

COLORADO.

BOULDER COUNTY.

Three carloads of ore from the Wirth mine at Ward gave returns of six ounces gold for the first-class and 3.44 ounces for the second-class. The lot netted \$1120. Eight carloads of mill dirt were shipped from the same mine of a general average of \$30 per ton in gold.

Ward's producing mines are the Newmarket, B. & M., Sullivan, Utica, Dew Drop, Ward Rose, Ruby Sullivan, Nelson, Wirth, Morning Star and Gold King. Nearly 600 men are employed. The camp contains the longest tunnel in the county, the Adit, being 3000 feet, which cuts the Dew Drop a distance along the vein of over 1000 feet.

The Emancipation mine, Sunshine district, has an output of sixty tons per month of high-grade ore, taken from the 400-foot level, at which depth new ground is opened and new ore bodies found.

The Larimer tunnel at Caribou is making ore shipments running from \$40 to \$300 per ton.

CHAFFEE COUNTY.

(Special Correspondence).—The smelting plant of the Buenavista Smelting & Reduction Co. has commenced operating at Buenavista, Colo., under the management of B. F. Morley. Its purpose is to treat the low grade silicious, sulphide ores which are produced in the tributary country, which do not bear shipment to more distant smelters. The work done here is a semi-pyritic smelting, there being copper enough in the ores to collect the values and make a tolerably clean slag. The product is a matter containing gold, silver and copper values, twenty tons of ore being reduced to one ton of matter. The ore contains some zinc which is eliminated in the process. The plant can handle ten-dollar ore profitably. The company is operating on ores from their own mine, the Mary Murphy, a few miles away, which has been worked for eighteen years. The smelter, which has a capacity of over 100 tons per day, has some new features, designed by Mr. Nesmith, of the Colorado Iron Works. WASCOTT.

Buenavista, Colo., Aug. 24th, '98.

The Jasper mine in Turret mining district is showing up some fine ore from recent shipments. The mill returns gave from the hematite ore \$107 and \$136 per ton.

The Jasper mine in the Turret mining district has a 3-foot vein carrying an 8-inch pay-streak from which a mill run gave returns of \$136 per ton in gold. There are two ore chutes in the property.

CLEAR CREEK COUNTY.

The Dives-Peligan group, near Silver Plume, has seven levels. The shortest is 2800 feet and the longest 6000 feet. Every level is in good ore. The streak of smelting ore averages 3 feet, while the values run from \$75 to \$250. The shaft cuts the second lower level at 700 feet. This part of the property is giving employment to 153 men.

DOLORES COUNTY.

The ore shipments from Rico for eight months ending Aug. 21st, '98, were 526 cars, a gain over the same period last year of 221 cars.

EAGLE COUNTY.

Last week were shipped from Battle Mountain district fifteen carloads of ore, making a total of 270 carloads, 8,123 tons, since January 1st.

EL PASO COUNTY.

(Special Correspondence).—The Monument shaft on Battle Mountain has reached a depth of 340 feet. On the 300-foot level rich streaks of sylvanite were formed in the granite. E. Everett is manager and says he is shipping two or three cars of ore a week that runs as high as four ounces to the ton.

The Newell tunnel is 1,400 feet in Grouse Mountain. One blind lead was struck which the manager thinks will justify the building of a mill to handle the ore.

The Standard tunnel has been driven into Beacon hill a distance of 2,200 feet and the work still goes on.

The Grace Arthur is now in charge of James Mackin, recently from Prescott, Arizona. At a depth of 120 feet the work is in low-grade gold ore. WASCOTT.

Cripple Creek, Colo., Aug. 24th, '98.

The Cripple Creek output for August was 35,740 tons with a bullion value of \$1,405,200. This is an increase of nearly \$100,000 over July. The cyanide and chlorination plants extracted \$669,200 in gold from 25,240 tons. The tonnage treated at the smelters was 10,500 and the bullion value was \$735,000.—The Modoc ore output, Cripple Creek, for August was not as large as heretofore, as development work has been extensively performed and only a nominal amount of work on the ore bodies. The shaft is put down 720 feet.—Work has been started retimbering the Lillie shaft from a depth of 500 feet to the surface. The shaft is to be 5½ feet in the clear; the property is to be equipped with fine machinery.

Denver Mining World: W. S. Stratton has decided to place the Independence once more among the heavy shippers of the Cripple Creek district. Plans for new ore bins and sorting rooms have been drawn and lumber dealers and contractors are figuring on the job. Before the month is over work will be under way. For the past year the output from this

mine has been light, as only the ore encountered in drifting, sinking and unraising has been marketed. It was rich enough, however, to meet the mine expenses, and Stratton was satisfied.—Twenty tons a day is the output of the Granite mine on Battle Mountain from a depth of 700 feet, at which point the ore shoot is 5 feet wide and averages \$30 a ton. The upraise from the 700-foot level has been connected with the drift at 600 feet depth and a large block of stoping ground opened up.—The first shipment for some months from the Hallett & Hamburg, Cripple Creek, consisting of three carloads of 4-ounce ore, was sent out last week. The crosscut at the 325-foot level has opened a good body of ore, and with new stopes opened up, shipments will be steady and permanent.—Shipments from the Moon-Anchor Co. properties amounted to 170 tons last week. Of the total amount sixty tons was mill ore and the rest was consigned to the smelters.

GILPIN COUNTY.

The daily shipments of the Pederson mine near Central City are 30 tons of mill ore, averaging 3 ounces gold per cord on the plates, the concentrates running from \$15 to \$25 per ton. The smelting ore gives returns of \$30 per ton. Employment is given to forty-three men.—The vein has been struck in the 900-foot level of the Sleepy Hollow mine, and assays show 12 ounces gold per ton, but the vein is small. Forty tributaries are at work.

LAKE COUNTY.

Leadville. (Special Correspondence): Evans & Donnelly, lessees of the Adams discovery on Carbonate Hill, are shipping sulphide and lead carbonate ores from various levels in the 700-foot shaft. The chief values are in lead, silver and copper.

The Pyranee, under lease to the Rialto Mining & Leasing Co., is being developed by a shaft which at present is 1200 feet deep. They are sinking to get the ledge uncovered in the Mab. Two pumps at the bottom of the shaft deliver about 100 gallons of water per minute.

The Mab mine shaft is down 1010 feet. The first level at 1000 feet runs 600 feet to the ore chute, which dips to the southeast and raises to the northwest. The ore is a sulphide of lead, carrying gold, silver and lead values. Supt. Sam Nicholson reports the shipment of about 125 tons per day. A pump at 860 feet and another at 1000 feet keep the mine tolerably clear of water.

The Wolfstone, on Carbonate, with a 1000-foot shaft, is shipping from the 700-foot level about 1000 tons per month of silver-lead ore. The workings below the 700-foot level have been flooded with water ever since the Maid of Erin pulled her pumps. These lower workings are reported to contain rich carbonate ore and while this property will not be affected by the proposed work of the downtown pumping association, it is very likely the mine will be unwatered next year. The Wolfstone is under lease to Chas. Hill and Sam Nicholson.

The old Breese mine, on Breese Hill, is being worked by the Penn Mining & Leasing Co. Three shafts are equipped with machinery, and a new 10-stamp mill is at work on the property. A lot of low-grade oxidized porphyritic quartz is being milled from an open cut on the lower claims.

The Ballard, on Breese, is being developed by Lessees Turnbull, Golob and Poos, who have struck a body of silicious ore at 350 feet, which carries lead, silver and gold.

The Ibez group, on Breese Hill, has six well-equipped shafts, from which about 7000 tons of ore are handled per month. The ores at 300 to 400 feet depth are oxidized and at greater depth they are sulphides. All, however, contain gold and silver values and are treated by the smelters. No. 2 shaft is 700 feet deep, three-compartment and double cage. It has five 80 H. P. boilers, a 50 H. P. hoist and a ten-drill compressor—the last named operating drills in the shafts excepting at No. 5. No. 3 shaft is 700 feet deep and has nearly the same boiler and hoisting power as No. 2. It has a 1000-gallon per minute pump. No. 4 shaft has four 80 H. P. boilers, an 85 H. P. hoist and is 900 feet deep. No. 5 has the same equipment as No. 4 and has reached a depth of 960 feet. No. 6 shaft is at a depth of 300 feet and is developed by four levels. No. 1 has good equipment. The underground workings connect the six shafts. At each shaft is an ore bin of 1000 tons capacity. New bins are being built at various switch termini of the incoming Ibez branch of the Denver & Rio Grande Railroad. The Ibez Co. has on the ground a complete machine shop and dynamo for lighting all the shafts. John F. Campion is Gen. Mgr. of the Ibez and E. M. Ray is Supt. of the mine.

The Forest Queen, which joins the Ibez group on the west, has a 600-foot shaft and it is the intention to sink to the 1300-foot level to get through the porphyry dyke in which they are now and to strike the level of the Yak tunnel, which is being driven from California gulch with this part of Breese Hill as the objective point. From the mouth of the Yak tunnel to its proposed terminus, in the Ibez grounds, is three miles, two miles of which is already driven. The Yak people control the Forest Queen.

George Campion is sinking two shafts in South Evans gulch—one being the Howard, 715 feet deep, and the other the Bob, 100 feet deep.

The New Year, in South Evans gulch, is being worked through an incline 2000 feet long by Lessees Canning, Johnson and Statham, who are shipping gold-silver-lead bearing ore.

The Resurrection, on Little Ella Hill, is shipping about 2000 tons of silicious gold and silver ore per month.

The Sedalia, adjoining the Resurrection, has been closed down since July 1st, but it is expected to resume work within a month. Different levels yield different ores—gold-bearing quartz in some parts and lead carbonate in others.

Below the Sedalia is the Fortune, with a

425-foot shaft, which is being sunk to the 700-foot level to reach the Sedalia vein. The Fortune is under lease to John Doddridge and associates.

Still below the Fortune, in Big Evans gulch, is the Dolly B., of which P. K. Connelly is manager. It has an 800-foot shaft, from which some lead carbonate ore shipments are being made. The property is equipped with heavy hoists and compressors and pumps.

The Famous, in the same gulch, is under lease and bond to R. T. Root, who has sunk a development shaft 600 feet and will now drift northward for the vein.

The Monarch, between Big Evans and South Evans gulches, is shipping about twenty-five tons per day.

The Small Hopes group, comprising the R. A. M., Emmett and others, is a constant shipper. WASCOTT.

Leadville, Colo., Aug. 27th, '98.

The William Wallace mine of Leadville is producing about seventy-five tons of ore per day, and has made a 10,000-ton contract with the Globe smelter in Denver. The ore carries some silver, but is largely iron excess.

The Bull Hill group on Mt. Elbert, owned by J. W. Beam of Denver, is opened by over 1000 feet of shaft work in the form of shafts, tunnel and drift. One shaft at 100 feet shows 3 feet of ore which assays \$42 per ton.

The Mab Mining Co. Leadville, is outputting 120 tons daily. As more ground is opened new men will be put to work. With the additional ground opened there is no perceptible increase in the water; the working level is 1000 feet deep.

LA PLATA COUNTY.

The Sundown mine at Mancos milled 19,990 pounds of ore which yielded \$45 a ton.

MINERAL COUNTY.

The Ridge mine, Campbell Mountain, shipped in August 160 tons of lead and 300 tons of zinc.

OURAY COUNTY.

(Special Correspondence).—Last year the Cleopatra M. & Co.'s smelter at Ouray, Colo., was receiving ore from only twelve properties, in small quantities and irregularly. This year it is getting regular consignments from thirty mines in Ouray, Hinsdale, San Miguel and Dolores counties. It has stimulated prospecting on low-grade properties and kept several mines of this class from closing down. Ouray, Sept. 5th, '98.

PITKIN COUNTY.

The Homestead of Aspen is working on quartzite ore, which returns from different shipments 45 per cent lead and \$90 in silver per ton. The vein is 7 feet wide.

Gold ore is being taken from the Dewey mine near Aspen that runs from \$12 to \$15 per ton, and increases in value as the development increases.

SAN JUAN COUNTY.

The Oro mine, Bonita mountain, has a 5-foot vein that yields \$23.50 per ton gold.

SAN MIGUEL COUNTY.

The Belle-Champion mine in Saw Pit gulch is outputting four carloads per week of good grade ore.

The Tom Boy mill at Telluride is treating from 200 to 260 tons of ore every twenty-four hours. The output is locally said to be \$100,000 a month. The vein shows from 10 to 16 feet of ore.

SUMMIT COUNTY.

(Special Correspondence).—Taking the South Park railroad at Leadville, the traveler winds up the Arkansas river to its headwaters, crosses the continental divide at Fremont's Pass, drops down the Pacific slope, along Ten-Mile creek, to Robinson, Kokomo and Dillon, the last-named being on the waters of the Blue; thence up the Blue to Breckenridge, and he has traversed the backbone of the Rockies at one of its richest and most rugged points.

At Kokomo the Col. Sellars, a rich producer of gold and silver bearing ore, is shipping regularly about 100 tons per day. In the same locality, the El Dorado, Nettie B., Wilfley, Hercules and White Quail are shipping in the aggregate about 200 tons per week. Aug. 25th, '98. WASCOTT.

Breckenridge. (Special Correspondence): The North American Gold Dredging Co., under the management of Ben Stanley Revett, are operating two Risdon dredges on Swan creek, near Breckenridge, and a hydraulic plant as well. Where the dredges and hydraulic elevator are at work the sand and gravel are about 30 to 45 feet deep. A great deal of material has thus far been handled and the work is progressing in a very systematic manner. The hydraulic apparatus being operated a mile below the dredges consists of the ordinary flume and giants, an Evans gravel elevator, which conveys the gravel from bedrock to the sluice way, a distance of 42 feet, with 176-foot pressure and through an 8-inch throat. The gravel is of that composition as to make it very easy to handle. A steam hoist with wire rope and pulleys and conveyors are used to move the heavy boulders from the bedrock.

The work on lode properties on Mineral and Farncomb hills is mostly in the hands of lessees and the results are only moderate. On Mineral the ores have been of a silver-lead nature, while Farncomb has a record of having produced a great deal of free gold in seams and pockets near the surface. Its production has not been great this year, though lessees are said to do well. Nowhere on Farncomb has work been carried to any great depth. The Wapita Co., which controls most of the exploited ground on this hill, has a 1000-foot tunnel, from which an upraise goes about 500 feet to the surface. This represents the deepest work on the hill. On the north side some profitable hydraulic work has been done by the same company, which has a fourteen-mile flume, through which sufficient

water is brought from South Swan creek to work a few months of the year.

The Boss mine on Farncomb, which belongs to St. Louis parties, is being worked by M. E. Griffin of San Francisco.

What was formerly known as the Peabody placers, in Gold Run, are being worked by the recent purchasers of that property.

The Mountain Pride on Baldy mountain has an excellent plant of machinery and its managers are doing some valuable prospecting.

The Pence-Miller Placer Co. have completed their hydraulic plant on the Blue, putting in the Ludium sinking pump and elevator. They have worked but a few weeks.

The Jumbo mine and mill are now both operating. The mill has been closed down several years.

The ore shipments from Breckenridge average about 300 tons per month. They consist of sulphide and carbonate ores, which run about \$35 per ton. WASCOTT.

Breckenridge, Colo., Aug. 30th, '98.

The Colonel Sellers mine at Kokomo outputs 175 tons daily of iron sulphide ore. It also carries gold and silver. Considerable new development is constantly kept ahead of this production.

IDAHO.

(Special Correspondence).—A company of Indiana capitalists have secured an interest in the Gold Drop mine near Dewey and have begun work. The property comprises fifteen claims, and much development work has been done on them. The tunnels cut the ledges at a depth of over 1000 feet. Dewey, Sept. 3rd, '98.

Senator Pettigrew of South Dakota, who with others has a bond on the Empire mine at Silver City, is making his second visit to the mine. The property has been unwatered to the eighth level and is cleaned out for inspection.

From Buffalo Hump the first pack train load of ore was sent last week from the Big Buffalo for Florence.

The Jesse James group near Custer has been sold to B. Wooley, representing a company, for \$60,000, a portion of which was paid cash. The property has a vein 10 feet wide that mills \$23 gold and six ounces silver per ton.—In the Lucky Boy mine near Idaho City the pay chute varies in thickness from 3 to 6 feet and the ore averages \$24 a ton in gold. In addition to the high-grade chute there is from 7 to 10 feet of ore that carries from \$7 to \$15 a ton.

The report of the Tiger-Poorman mine presented at the recent annual meeting shows that during the year 112,607 tons of ore were mined and milled, being reduced to 16,638 tons of silver-lead concentrates, which was shipped to smelters. The profit from the mine was \$64,604, being \$57 a ton crude ore, or \$3 88 a ton of concentrates. The rate of concentration was about 6.8 tons into one ton. The shaft has reached a depth of 1400 feet.

Statesman: The difficulties of getting the foundation of the Basic Co.'s big dynamo to its destination may delay starting the Placerville dredge until the middle of September.—The 5-stamp mill going up at the Bruiser group of gold mines at Grimes began crushing last week.—Retimbering the 2000-foot Morning Star tunnel is progressing rapidly. Fifty men are camped near the mine waiting to be put to work.—The new 5-stamp mill at the Twin Sisters mines, near Centerville, is crushing two tons to the stamp per day. The plates show that the ore is good.—Walking & Wisher are opening a hydraulic claim near Twelve-Mile House.—Supt. Kincaid is cleaning out the tunnels and drifts of the Elkhorn preparatory to doing some prospecting for a Denver company. He is running the 5-stamp mill right along.—With the exception of the Summit Flat quartz property, the mines, ditches and water rights owned by Ben Willson & Co. on Grimes creek were sold at sheriff's sale last week to T. W. Duff, agent for the Oriole Co., which held the judgment against it, for \$10,980. The ditches and ground are scattered a distance of nearly twenty miles.

MONTANA.

Operations on the placer mine at McCauley's bar near Clancy began this season about April 1. Since that time two outfits made three clean ups and took out eighty ounces of gold.

In the Hecla mine at Lion City, which has been idle twenty years, work was resumed last spring, and the property is again productive. An 8 foot ledge has been found that yields 300 ounces in silver and 40 per cent lead.—Leasers on the old Trapper mine are said to have put \$23,000 worth of ore in three months.—The Montana O. P. Co. is erecting one of the largest gallows-frames in Butte at the Karus mine.—The Queen mine near Butte has been leased by Kangle & Leslie. Ore is going into the bins and a 20-stamp mill is being built.

The new tunnel at the Stray Horse mine, near Winston, is in about 500 feet and ore is found in increasing quantities as the work proceeds.—At Toston the bituminous coal mines which have been idle several months are to be again operated.

At Sylvanite the Goldfint is working about thirty men and the stamps are using seventy tons of ore of good grade every twenty-four hours. The Keystone is working three shifts and shows an ore body that will require the erection of a large plant at an early date. Work is being pushed on the Juliette, the Eberhart, the Kansas as usual, and the outlook for the camp is good.—At the Cruise mine near Marysville the mill will be increased to twenty stamps. There will also be put in 12 pans and six settlers. All the work will be done before the holidays and the property will be in condition to yield and treat 100 tons a day.

NEVADA.

(Special Correspondence).—The State of Nevada has had an illustrious career in the mining line. The first chapter opened with a

series of brilliant discoveries following each other in rapid succession, which added a billion in treasure to the world's circulation. Many causes have contributed to bring on a period of depression in marked contrast to the opening years of State life. The distance from money centers, the scarcity of fuel and water, lack of transportation facilities, the fall in the price of silver and the temptation offered by booming mines in other regions, have turned the current to other fields and the State has not prospered as its neighbors have. But there seems promise of a change and a renewal of interest in the heavily mineralized districts of Nevada, where prospecting is going on with vigor, and in some places large investments are being made.

The one that locally promises most is the Glasgow & Western Exploration Co., J. P. Coates president. It seems to have unbounded means at command, and owns a mine in Utah, one in Montana, the Gray Eagle and Star at Cherry Creek in White Pine county, Nev., and extensive bodies of copper twelve miles south of Golconda, on the line of the C. P. R. R.

Otto Stahlmann is manager. Unfortunately Mr. Stahlmann shares General Woolsey's opinion of reporters. A well-known writer approached him not long ago and went away with the remark, "If I wanted this place written up, don't you suppose I could do it better than you could?"

Access to the works is not denied. The mine lies in the mountains, and formerly was approached by a road up a canyon from the southeast. In digging a grade more directly to the mine a body of superior ore was uncovered on the north side of the hill, which is being quarried out and hauled to the mine with teams at considerable cost. A railroad will no doubt be built to carry the ore down. The buildings stand on the open plain about a mile east of Golconda, with the Humboldt river running near and the railroad on the south side, connected by sidings with the furnace and the mill. The works consist of a 150-ton mill, east of which lie two Bruckner and two reverberatory furnaces, capable of working sixty tons of ore every ten hours, resulting in four tons of matte. The foundations are laid for two more furnaces, and it will not be long before the mill is running day and night.

The ore goes to the top of the mill in an automatic hoist and falls from the chute into a rock breaker, which sends it to Cornish rolls, thence through jiggers, a Huntington crusher, slime tables, etc., to the furnaces, where it is mixed with concentrates from the Gray Eagle in White Pine county.

Everything at Golconda is in charge of T. M. Davis. There are plenty of people who predict that Golconda will soon be as big a copper camp as Anaconda, and it looks as if their hopes might be realized.

Golconda, Sept. 1st, '98.

The gross value of the ore taken out of the De Lamar mine from April 1st to June 30th is reported to be \$417,516.93.

Chicago men are interested in copper properties near Austin and will develop them.

Sentinel: The old shaft of the Eureka Con. mine at Eureka is being repaired and is in good shape to the ninth level. Steam is being kept up at the hoisting works. It is stated that the prospects for finding ore are improving.

NEW MEXICO.

Silver City Enterprise: The Santa Rita Copper & Iron Co. owns seventy copper and iron claims and has 100 men employed in the mines. The greater number are working on a royalty, and most of the miners are making more than wages. The camp is producing about 600 tons of copper ore per month. The Santa Rita Copper & Iron Co. is shipping six cars of iron ore per day.

The dredge that has been in operation in the Moreno Creek placers the past season has been a success. The machine handles 300 yards of 25-cent gravel daily and works smoothly.

OREGON.

Near Roseburg, in the Noonday mine they tapped a vein at a depth of 400 feet, 8 feet wide, of free milling ore running from \$20 to \$100 per ton. The company will run 400 feet more of tunnels before starting the mill.

Journal: The Eureka mine and mill near Grant's Pass will shortly start up again. In the several months during which the mill has been idle the company has been submitting samples of ores to experts in different parts of the country to ascertain what process was best adapted to saving of the non-free milling values in the ores. As a result the ores will be concentrated and then cyanided. The Miller mine is a large property.—Twenty men are employed by Jones & Gorham on their late purchases in Mt. Reuben district. In the California mine, after striking the ledge at the end of a 599-foot tunnel, this ledge was crosscut and drifts have been run 235 feet. This work continues. The ledge is 14 feet wide. In the Gold Bug mine development continues with good results. Ground is being cleared for the stamp mill. The company will put in at first only five stamps, but the mill will be so arranged that it may be readily enlarged. The machinery will be on the ground as soon as the road is completed.

SOUTH DAKOTA.

The Dakota Maid mine at Galena has a ledge of ore 4½ feet that assays from \$12.50 to \$44 a ton.—In the Great Northern shaft at Two Bit they are down 250 feet in hard shales.—The shaft of the Chicago and Two Bit has been sunk 400 feet.

UTAH.

In the South Swansea mine at Silver City on the 650 level a new ore body has been found locally reported to be the best ore the company has discovered.—In the Comstock at Park City an ore body has been opened that carries sulphurates of silver and a good percentage of copper.—At Stockton on the

Argent they are sinking to the 600-foot level. During the year the Argent has shipped some \$5000 worth of ore of an average of \$35 per ton net. Development work has held back extraction of ores.—On the No You Don't mine, M. Hennifer has opened up good bodies of low-grade ores. He shipped eighty tons East this week. His shipments this year have averaged fifty tons per month.—The Hercules has been shipping monthly this season, and sent last week sixty tons of good ore.—At the Honorine the tunnel is being pushed; a fine ore strike was made a few days ago. The Silver King is retimbering the shaft to water level 700 feet.—Bingham's shipments for August were 2586 tons.—From Tintic last week's shipments were 156 cars of ore, twelve cars of concentrates and one bar of bullion.—Silver City's ore shipments for the week were thirty-six carloads.—The old Silver King at Stockton shipped a carload of high-grade silver and lead ore.—The tunnel in the Hershel mine has reached 2200 feet. A winze is being sunk at one point and an upraise at another.

The ore body in the Rabbit's Foot at Silver City has been broken into at a depth of 357 feet and 4 feet of mineral is exposed that assays from 1.2 to 4.1 per cent copper, 50c to \$1.20 in gold and five to thirteen ounces silver.—The Columbia of Lion hill marketed a carload of ore that netted \$34 a ton, notwithstanding the long haul.—At Park City the Marsac mill is again in operation. The wooden chutes have been replaced by iron.—At Richfield the Annie Laurie developments show the vein to be between 30 and 40 feet in width. About 800 tons of second-class ore is one the dump, the average value of which is reported at \$40, while sacked and ready for shipment are eleven tons that yield \$200 per ton. The tunnel is in 350 feet.—The Grand Central at Mammoth closed the month with an output of 1800 tons of ore that provided \$31,250 for the September dividend and a large sum to the reserve fund, which it is said approximates \$100,000.—The Red Wing G. M. Co. at Bingham has made its first payment on the bond and arranged to discharge the balance—\$20,000—in four months. The lower tunnel is in 400 feet, where the vein has been reached. The upper tunnel is in 200 feet.—The Ophir Hill mine at Ophir is shipping 1000 tons of concentrates.

The Cigale Co., whose properties are at Mercur, has let the contract for a roasting plant, and in seven weeks the furnaces will be in operation, as will also the mill. The roasting plant will have a capacity of 100 tons a day.

The Eureka Hill mine and mill at Eureka last week sent out a consignment of \$125,000. This is the third of the kind the present season.—The lower workings of the Dalton & Lark at Bingham indicate that in a short time the copper ores will become a source of as much revenue as the other ores in the property. In the 850 level the chute carries an average of 8 per cent copper. The mill will continue to turn out about 500 tons of concentrates a month.

A shipment of silver and gold cyanides was made from the Chloride Point, at Mercur, valued at \$1750.

L. C. Doty & Co. have secured for two years a lease on the Apex group, at Eureka, for \$75,000, and have begun work on a tunnel.

At Ophir last year the Ophir Hill mine and mill remained idle, leaving the camp dormant the entire year. Now the mine is sending out an average of 3000 tons of ore per month, and the mill reduces this to 1000 tons of concentrates. This gives employment to forty men in the mine and mill.

WASHINGTON.

STEVENS COUNTY.

(Special Correspondence).—In Eureka district the Surprise quartz ledge has been prospected by a number of crosscuts in the croppings, which yield in gold from \$2 to \$36 per ton. The ledge is exposed 16 feet wide in the Blacktail tunnel, where it assays from \$5 to \$10 per ton in gold. The company contemplates sinking a shaft from the surface, where the highest assays came from.

A tunnel 80 feet in length has been driven, crosscutting a well-defined quartz vein, 11 feet in width, in the Pearl mine. Drifting 19 feet northwestward and 40 feet southeastward has given average values of \$7 in gold per ton. Exploration is being continued by the company on the lode southeastward.

A tunnel driven northward has crosscut one of the big east and west quartz ledges of the Lone Pine mine 15 feet. A drift 30 feet westward and 70 feet eastward on the ledge has developed quartz of from \$2 to \$40 gold values per ton. Samples from the croppings run as high as \$30 per ton. There are three other parallel veins upon this mine, which will be developed at over 250 feet in depth by a tunnel from above the east side of Eureka creek. This tunnel is in 136 feet, with 240 feet farther down to tap the first ledge north of the ore that has been crosscut in the northerly tunnel. The owners, the Lone Pine G. M. Co., have excellent prospects in their property.

The Quip mine shows a vein 72 feet wide between the walls. A great mass of ledge matter upon the footwall is faulted by a vertical movement of porphyry, which definitely separates it from the ledge in the hanging wall. The mine is opened by a tunnel, which has already penetrated the hanging wall, and quartz of high value and identical in appearance with the high grade ore from the Republic mine is being developed.

The Little Cove mine is opened by a vertical double-compartment shaft to a depth of 140 feet. At 125 feet depth a crosscut westward cuts the hanging wall, and, passing through a vein 20 feet wide between the walls, exposes 8 feet width of quartz, which carries its strength for 70 feet to the northwest, as shown by a drift in that direction. All of the material in that drift will average in value about \$7.50 per ton, all in gold. A drift of nearly 100 feet southeast, towards the Pearl, an adjoining location upon the same

vein, exposes the ledge from 10 to 12 feet in width, with assay values running in gold from \$2 up to \$60 per ton, and an average value of \$12. Farther to the southeastward and only a few feet northwestward from the Pearl, a surface tunnel has developed the same ledge 25 feet in width. There the average value is estimated at \$12 per ton, but samples of the quartz run as high as \$70.

The San Pail has been regarded as one of the most valuable mines in the district. It is situated northeasterly, at a distance of about two miles from the Republic. The vein is very well defined and easily traced by its surface croppings, which have been stripped and crosscut at interval spaces of about 50 feet from one end line to the other. A shaft sunk 50 feet on the ledge has developed assay values ranging from \$10 to \$300, with an average commercial value of about \$20 per ton in gold. No. 1 tunnel crosscuts the ledge, under the shaft, at a depth of 100 feet. Thence a drift carried southeasterly 25 feet and northward 130 feet shows a solid ledge of quartz from 4 to 8 feet in width, with an average of about \$20 per ton. From the point of intersection by the tunnel a winze has been sunk 15 feet upon the ledge, which goes down 5 feet in width and carries values of \$18 to \$80, with an average of about \$30 per ton, substantially in gold. The samples have shown returns of twelve and fifteen ounces respectively in silver. The drift has been carried 40 feet beyond the point 130 feet northwesterly from the winze, but with the quartz pinching between hard walls in the roof. It, however, shows about 2 feet of quartz in the bottom. A tunnel enters the hill, with sufficient dumping room, from the west side of Eureka creek, to tap the vein at a depth of 250 feet. It is now in 315 feet, with 60 feet farther to run.

The Mountain Lion mine, situated northerly about three miles from the Republic, combines two full claims and a fraction, and presents an exposure at the surface of three separate quartz ledges. The surface developments consist of two crosscuts and a shaft upon the center vein, 50 feet in depth. A crosscut, 9 feet in length, from the bottom of the shaft, touches neither wall. Samples of the quartz run from \$12 to \$25 per ton, principally in gold. Running westward from the shaft is a trench about 3 feet in depth which has cut 25 feet across the ledge, the quartz giving assays of from \$7 to \$12 per ton. This appears to be the main ledge. The west ledge runs parallel with it, but will not average more than \$5 per ton of quartz. The easterly vein strikes to the northeast and shows comparatively little value. A tunnel has been driven from an elevation of about 75 feet above Granite creek to intersect the veins of the Mountain Lion property; it enters the hill from the west side and passes 718 feet through porphyry strata to the footwall of the west vein at 310 feet depth below the surface. As seen in the tunnel, the vein stands almost perpendicular, dipping with a slight inclination to the northeast. It is 8 feet wide and yields average values of about \$10 per ton. At 756 feet in another ledge was encountered, which crosses the tunnel at an angle of 60°. That was cut through in 18 feet, and, after passing through 3 or 4 feet of porphyry, the tunnel is again in quartz. What the extent of this vein is cannot be ascertained at this writing. It evidently does not show at the surface, and the center vein should not be reached within the next 70 feet. The assays are stated to run from \$30 to \$40 to the ton. A mill is contemplated for this property, and active steps will be taken for that purpose as soon as the plans are matured. M. H. JOSEPH.

At Republic, W. H. Giles bonded the Sampson and Dewey claims to H. I. Kressley of Illinois for \$2000.—C. A. Wallace of Chicago has bonded a half interest in the Greenberg mine near Keeler for \$10,000 and will immediately begin extensive development of the property.

WYOMING.

The Bradley mine near Laramie is being successfully worked and has a large body of high-grade ore at a depth of 127 feet.—The American G. & C. M. Co. near Laramie is developing two of its sixteen claims. The Jesse lode is free milling gold ore and the vein is nearly 100 feet wide, recent assays showing from \$8.40 to \$45.60 per ton.

Herald: Near Grand Encampment work has been suspended on the Golden Eagle mine and all men put to work on the Charter Oak, at which a new steam hoisting and pumping plant has been installed. It is the intention to sink 300 feet on the Charter Oak and work will be pushed with three shifts.

FOREIGN.

BRITISH COLUMBIA.

At Slocan a two-thirds interest in the Fidelity mine was sold for \$10,000 cash.—The Ajax has seventeen men at work.—Five feet of ore in the lower tunnel of the Payne was found and the force has been increased to 140.—At Ymir fifty men are working in the Puerto Rico mine.—In the Meadow Lark mine ore has been found that runs \$92 in gold per ton.—At the Cariboo mine, Quessnelle, flumes are in place and the dirt being rushed through. The amount of the full wash-up is generally believed will be large, from \$100,000 to \$150,000. It is known that one 10-inch streak of gravel was found in the workings that is said to average more than \$30 to the yard. The water is holding out well.—In the Jumbo mine at Rossland the main tunnel is in 800 feet and is crosscutting the ledge.—Pay ore has been found in the Riverside property at Grand Forks in a ledge 9 feet in width that assays \$40 in gold and copper.—The War Eagle at Rossland last week shipped 870 tons of ore.—The report of J. Monaghan, Pres. of the Cariboo mine, Camp McKinney, ending July 1, 1898, showed, among other things, that the mill had crushed 6770 tons of ore that yielded \$121,270 in bullion and \$17,943.64 in concentrates. For the same period during the previous year, the records of the

company show an output of 6742 tons of ore, which yielded in bullion \$104,826.09 and in concentrates \$13,513.39. The output for the year was an increase of but eight tons over that of the previous year, while the increase in value of production was \$20,904.06.

It is reported from Greenwood that the final payment of \$27,000 has been made on the B. C. mine in Summit camp by A. H. Harrison and his associates.—The sale of the Lily May at Rossland to the English-Canadian Co., Ltd., has been completed, and it is expected that work will be resumed about the first of November. W. J. Harris, who represents the purchaser, has instructions to let contracts at once for supplies and to call for bids to sink the shaft 100 feet farther. The transfer was completed last week and the basis of the sale was \$10,000 cash and 70,000 £1 shares of stock. The consideration is equivalent to \$360,000.

At Grand Forks a miner, while working at the Republic mine, stole \$350 worth of amalgam from the plates at the stamp mill. After taking the amalgam the thief started to escape and succeeded in going as far as Nelson, Wash., where he was overtaken and captured.

In the Fern mine, near Nelson, for the week ending August 14th, the number of tons of milling ore mined was 297; the mill ran 164 hours, the number of tons milled was 265, or four tons per stamp per day.

BRITISH GUIANA.

The government of British Guiana has lately taken practical steps in arranging for geological surveys in the gold districts. A survey has been conducted by J. B. Harrison in the northwest district and the results embodied in a report, while an additional report on the petrology of the district is awaiting publication. A further expedition to examine the formations of the Potaro-Conawarook district is now being organized. The great importance of this work will be recognized in view of the fact that there are no trustworthy official reports on the geology of British Guiana in existence. The experience of the past ten years has proved that British Guiana is rich in gold, and what is now needed is the importation into the colony and the adoption of mechanical washing appliances for alluvial gold. By such means, deposits of alluvial gold, vast areas of which are known to exist (but would not pay to work by the means now employed), could be made to produce large quantities of gold. During the year ending June 30th the amount of gold exported from the colony was 117,265 ounces, or a decrease of 10,326 ounces upon the output of 1896-97. This serious decrease is partly ascribed to exceptionally bad weather and partly to the exhaustion of alluvial workings in the Barima district.

MEXICO.

Modern Mexico: Twenty-five cars of ore are shipped from the Sierra Mojada daily.—Machinery for the new smelter to be erected by J. R. Magruder is arriving at Hermosillo.—A Philadelphia company operating near Mamimi, Durango, is completing a furnace of forty tons capacity for smelting its copper ore. A railroad will be built from the Mexican Central tracks to the mine.—A 40-ton Reliance Chilean mill has been erected at Ameca for the Barranca mine, which is working 150 men and turning out ore that averages \$20 and upwards in gold and twenty to thirty ounces in silver per ton.—G. J. Reiger sold the San Pablo mine near Chihuahua for \$60,000.—The new 10-stamp concentrator at the mines of L. Ephraim at El Promontorio has started on a large dump of second-class ore.—F. Borquez has sold to the Sabina M. Co. five claims in the district of Baucari for \$5000 gold and one-third of the stock in the company.

Monterey Globe: The Mexican Metallurgical Co. of San Luis Potosi and the La Plata M. Co. of Monterey have organized the Chrysolite M. Co., with a capital of \$500,000, and transferred to it their holdings in the eight mines known as the San Felipe group, located in the Sierra Madre mountains, near the terminus of the Monterey Mineral Railroad. The new company purchased the interests held by J. A. Robertson and J. Rice in these properties, paying at the rate of half a million dollars for the whole. The Denver mine, owned by the La Plata Co., has been leased to the Chrysolite M. Co. for twenty years. The combined properties cover 370 acres, located in the center of the most important silver and lead mining district in the republic of Mexico. Plans have been adopted for work on a large scale. Four crosscut tunnels will be driven north and south, varying in length from 500 to 1000 feet, with the necessary connecting shafts and winzes. The main tunnel is to be driven on the vein from east to west 400 feet in length, traversing all of the mines. It will be 3200 feet below the existing works of the Denver mine. The present force of 200 miners will be increased to 1000 within the next few months. Modern methods will prevail in working this big consolidation. An electric plant will be installed for lighting, ventilating and running power drills. The equipment will include telephone lines, aerial cables and surface tramways.

SIBERIA.

Writing of the regions to be developed by the Trans-Siberian railway, H. H. Pearce, Charge d'Affaires of the United States Legation at St. Petersburg, says:

"That this great railway system is designed to open up a country of great richness cannot, in the light of present knowledge, be denied. The mining regions of the Ural, the Altai and the Sayan mountains have remained undeveloped and, indeed, but little explored, because of the difficulty of the transportation of their product, all the great waterways reaching them flowing northward into the Arctic ocean. Already, in the Urals, enterprise is making progress, and operations in the mining and smelting of iron and copper ores and working of metals are being established.

Oxidation of Amalgamating Plates.

TO THE EDITOR:—In the issue of August 25th, on page 203, I note a "Concentrate" on the oxidation of amalgamating plates in quartz mills, in which such action is attributed to "the oxidation of copper in the amalgam; or it may be due partly to the effect of sulphates in the ore, in which case it would be at least partly a basic sulphate of copper." The above may to a very small extent cause the discoloration of the plates spoken of, but the main cause is the mode of preparing the plates for electro-plating, which is done by immersing the plate in what is technically called the pickle, the chief ingredients of which are dilute sulphuric and nitric acids. Copper is a very porous metal; the acid penetrates to considerable depth and cannot be removed or neutralized by immersion in any alkali. The union of the silver to the copper cannot be perfect, as the pickle has already imbedded itself in every particle of the copper surface and an oxidized surface is presented for silver to be deposited on. The result is that with the oxide of copper working on the lower side of the film of silver on the plate, and the quicksilver absorbing the silver on the upper side, the copper is soon exposed, when "the greenish or greenish gray film shows itself."

Another cause for the exposure of the copper is the use by millmen of nitric or sulphuric acid in the cleansing or dressing of the plates. On one occasion I visited a mine in this State where nearly half the surface was entirely denuded of the silver, and all efforts to recoat it with silver and gold amalgam failed. I asked the owner of the mill if he had used nitric acid on the plates: He said "no," but a few days later I found on a shelf two large bottles of nitric and sulphuric acid about half full. On calling the owner's attention to them, he recollected that one of his millmen requested him to get the acid, and it was undoubtedly used

In the article referred to, discussing the greenish or greenish-gray film forming on copper plates, it is said: "On good electro-silver plated copper plates, it is probably never seen." To this I perfectly agree, and this short sentence disproves the theory that "it

Roasting Ore at Keswick, Cal.

There is considerable present discussion regarding the "smoke nuisance" at the works of the Iron Mountain Mines Co. at Keswick, Shasta Co., Cal., in San Francisco and Shasta Co. papers.

weeks ago the Glasgow Corporation invited tenders for the supply of 1000 tons of cast-iron pipes. The two lowest offers came from the United States, but as the castings were wanted in 9 feet lengths, and those specified by the Americans were 12 feet long, revised

BLAST FURNACES AT KESWICK, CAL.

is due to the oxidation of copper in the amalgam; or it may be due partly to the effect of sulphates in the ore." If it came from the oxidation of sulphates in the ore or from the oxidation of copper in the amalgam, why does it not show itself "on good electro-silver

Complaint is made that the adjacent vegetation is destroyed, and life for all animals requiring oxygen made burdensome by the noxious gases arising from the piles of burning ore. The contra assertion is made that the creation of such fumes is unavoidable, and that the

estimates were asked for, and the amounts of the several quotations made known. The amended offers were opened on Monday, and an American firm again asks less than any of the others. As there are over 200 iron-founders in Glasgow, and most of them deal in pipes, the committee in charge of the contract decided to leave the matter over for further consideration."

How to Store Powder.

The question "How should powder be best stored?" referred to an expert on that subject, is answered by him as follows:

TO THE EDITOR:—Powder is best stored in a magazine that is properly ventilated, having top and bottom air. The floor should be at least 18 inches from the ground, and the ventilators so constructed as to prevent boys or fools in attempting to tamper with the powder; place the ventilator thus:

Powder properly placed should be at least 6 inches from side or wall of magazine.

Take, for example, 400 cases of powder: You should have a magazine 14x16 and 10 feet in the clear; place the bottom row of cases upon slats, then slats on top of cases, and so on, until you have your cases stored. By this means you get a top and bottom ventilation, which keeps your powder cool. When the temperature outside is from 90° to 110°, you will readily see the good effect. A magazine of the size herein indicated should at least contain eight ventilators. Nitro-glycerine freezes at 46° Fahrenheit, and a miner should always see that his powder is properly thawed in fall and winter, thereby saving himself trouble and the danger of miss shots. Powder at times becomes chilled while not actually frozen, and when a case has been partially used it is always best to keep it covered and allow the sawdust to remain in case, instead of throwing it out, until the case is entirely empty. Storing powder in tunnels or underground is to be condemned, as there is always more or less dampness, and the old saying: "Keep your powder dry" applies with equal force to high explosives.

STALL ROASTERS AT KESWICK, CAL.

in dissolving the silver on the copper, and so thoroughly impregnating the copper with the acid that the amalgam would not adhere to the copper without first scraping off the copper below the point of oxidation.

No acid should be used in cleansing the copper for electro-plating; it could be done perfectly with sand and a weak solution of cyanide of potassium, or even with sand and ammonia or caustic potash. Nothing should be used that will oxidize the copper, and no acid should be used in dressing the plates.

plated copper?" Simply because it is not caused by either, and does not make itself apparent until the film of silver coating the copper liberates the oxide of copper formed by the pickle used to cleanse the copper for the process of electro-plating.

A "52" MINER.

A TON of Atlantic water yields, after evaporation, eighty-one pounds of salt; of the Pacific, seventy-nine, of the Arctic and Antarctic, eighty-five; of the Dead sea, 187.

resultant damage is but a fractional part of the industrial benefit conferred by the continuance of the work. The ore is roasted from 47% down to a residue of 10% sulphur, and the operation is not conducive to increased natural beauty of the landscape. Herewith are illustrated the blast furnaces and stall roasters at Keswick.

"For Further Consideration!"

The following is from the London Mining Journal of Aug. 20: "Some

Copper Mining
Company
OF MONTANA.

Embodying all that
experience and
practical working
have demonstrated
as valuable in this
class of machinery.

The brakes, clutches and reversing gear are arranged to be operated by compressed air or steam, by means of auxiliary cylinders which are under full control of the engineer, stationed upon the elevated platform shown, insuring the most rapid work with absolute safety. Shaft hollow forged steel of ample strength and stiffness to withstand any strains; reciprocating parts of steel and are as light as consistent with the duty required; cylinders of the "overhung" type, weight being taken by a guide saddle, which admits of free longitudinal movement, due to expansion, causing no strain on bed plate or foundations; cylinders steam-jacketed, fitted with valves provided with Corliss releasing gear and hand cut-off, enabling the engines to be run economically with reference to the work to be performed; bed plates modification of the Porter Allen type, heavy and substantial, with large foundation base and anchor bolts. A duplicate of this engine has also been furnished the Homestake Mining Company of Dakota.

GLOBE BATTERY STEM GUIDE.

PATENTED AUGUST 24, 1897.

RIGID. SIMPLE. DURABLE. EFFICIENT. ECONOMICAL.

Effect a Saving in Friction Losses. No Trouble to Install. No Alterations of Mill Necessary. No Keys or Wedges to Adjust.

Manufactured only by GLOBE IRON WORKS, STOCKTON, CAL., U. S. A.
Manufacturers of All Classes of Mining Machinery. Estimates Furnished.

OFFICE OF WILDMAN GOLD MINING COMPANY, SUTTER CREEK, CAL., June 28, 1898.
Globe Iron Works, corner Main and Commerce Streets, Stockton, Cal.—GENTLEMEN: Replying to your inquiry about the Globe Patent Battery Stem Guides furnished us by you last fall, will say that you supplied us with Guides enough for ten stamps of the Wildman Mill. These Guides have been in constant use for the past eight months, and so far do not show any wear either on the Guides or the Stems. They are more convenient than any Guide I ever handled, and much time is saved with them in changing stems, etc. The Guide can be set so close you always get a fair blow on your dies, and the use of these Guides materially increases the crushing capacity of your batteries. It is our intention to replace all of our Guides with those of your make, and I cheerfully recommend them to anyone desiring a good, serviceable and economical Guide. Very truly yours, JOHN ROSS, JR., Superintendent.

WILFLEY CONCENTRATOR.

The Wilfley Table is fully covered by U. S. patents Nos. 580,338 and 590,675. Infringements will be prosecuted to the full extent of the law.

PRICE, \$450, F. O. B., San Francisco.

Some Practical Reasons Why the Wilfley Concentrator Should Be Used in Gold Mills:

1. It will successfully handle three or four times more material than any belt Concentrator made, without exception.
2. It will save more sulphurets in proportion while so doing, and catch any float gold, amalgam or quicksilver which may escape from mortars or plates.
3. It will make cleaner and much more valuable concentrates, thus saving useless expense for transporting valueless material, as also extra cost for treatment.
4. It requires little or no attention when once adjusted and no expert is required to either adjust or run the machine.
5. It will save much expense in power and room, and the first cost of a mill requiring concentrators.
6. It has no expensive belts to crack and wear out, nor complicated machinery to keep in repair.
7. It is the only sensible plan of concentration, as any kind of material can be worked, which is not true of any style of belt machine.

One of these machines will take the place of two or three belt concentrators of any style and do very much better work.

San Francisco, Cal. Los Angeles, Cal.**GOLD IN COLORADO!**Colorado has within its limits some of the great-
est gold mines that has ever been discovered. In
Cripple Creek in 1892 there were a few prospectors
looking over the hills; in 1895 the camp turned out
over \$8,000,000 in gold. Leadville, the old bonanza
camp and the mineral product of which made Den-
ver what it is to-day, is becoming a big producer of
gold. New inventions for working low-grade gold
ores, together with the discoveries made to work
rebellious ores, have opened up a field for the min-
ers such as they have never enjoyed before, and
Colorado has inducements to offer such as no other
district in the world possesses; the record of the
State in gold production for the last three years
speaks for itself. Among the other prominent
camps in the State are Telluride, Ophir, Rico,
Silverton, Mineral Point, Durango, La Plata,
Ouray, Saw Pit, Ironton, the Gunnison district and
many others. New finds are being made and new
camps are springing into existence every day.
The Denver & Rio Grande Railroad, which is the
pioneer road of Colorado and which has always
been the miner's friend, reaches all the mining
camps in Colorado. For elegantly illustrated
descriptive books, free, of mines in Colorado

DEWEY, STRONG & CO'S PATENT AGENCY.

Our U. S. and Foreign Patent Agency presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American reports, with full copies of U. S. Patents since 1872. All worthy inventions patented through DEWEY, STRONG & CO.'s Patent Agency will have the benefit of a description in the *Mining and Scientific Press*. We transact every branch of patent business, and obtain patents in all countries which grant protection to inventors. The large majority of U. S. and foreign patents issued to inventors on the Pacific Coast have been obtained through our agency. We can give the best and most reliable advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and circulars free.

The Pelton Water Wheel Company

Gives exclusive attention to the development and utilization of water powers by the most modern, economic and improved methods.

An experience of more than fifteen years, involving both the theory and practice of hydraulic engineering as relates to power development in its widest range of application, is at the service of its customers.

**Nine Thousand
Wheels**

Now Running,

Aggregating some 700,000 H. P.

ELECTRIC POWER TRANSMISSION.

Pelton wheels afford the most reliable and efficient power for such service and are running the majority of stations of this character in the United States, as well as most foreign countries.

Highest efficiency and absolute regulation guaranteed under the most extreme variations of load.

Assaying.—Part I—Gold and Silver Ores.

Third edition; Just Out. Rewritten and Improved by the Author, C. H. Aaron. Embraces 130 12-mo pages, with illustrations; well bound in cloth; 1896. Price, postpaid.....\$1 00

Assaying.—Parts II & III—Gold and Silver Bullion. Lead, Copper, Tin, Etc.

Latest edition. Contains 161 pages with illustrations, and is strongly bound in cloth. Much of the original text is replaced by new matter. Price, postpaid.....\$1 75

Prospector's Field Book and Guide.

By H. S. Osborn.....\$1 50

Roasting of Gold and Silver Ores and the Extraction of their Respective Metals Without Quicksilver.

Second edition. By Guido Kustel, M. E. Contains 156 pages, embracing illustrations of furnaces, supplements and working apparatus. Price, postpaid.....\$3 00

Modern Copper Smelting.

By Edward Dyer Peters, Jr. Eighth edition. Rewritten and enlarged. Profusely illustrated.....\$5 00

Practical Treatise on Hydraulic Mining.

By Aug. J. Bowie, Jr. On the use and construction of Ditches, Flumes, Dams, Pipes, Flow of Water on heavy grades, methods of mining shallow and deep placers, history and development of mines, records of gold washing, mechanical appliances, such as nozzles, hurdy-gurdys, rockers, undercurrents, etc.; also describes methods of blasting; tunnels and sluices; tailings and dump; duty of miners' inch, etc. Price, postpaid.....\$5 00

Practical Hydraulics.

A book for Civil Engineers, Miners, Millmen, Hydraulicians, Mining Engineers and Irrigators. By P. M. Randall. Contains useful tables for ready reference, in which the results of abstruse calculations are all placed in a form so that one can find what he wants in a moment. For the engineer the principles, formulae, coefficients, etc., are given; and for those not familiar with higher mathematics, examples, rules and tables are prepared. Is especially applicable to the Pacific Coast. Price, postpaid, \$2

The Explorer's and Assayers' Companion.

A third edition of selected portions of the "Explorer's, Miner's and Metallurgist's Companion." By J. S. Phillips, M. E. A practical exposition of the various departments of Geology, Exploration, Mining, Engineering, Assaying and Metallurgy. Price, postpaid.....\$6 00

The Metallurgy of Gold.

By M. Elssler. Profusely illustrated.....\$6 00

Cyanide Processes for Gold and Silver Ores.

By E. B. Wilson, E. M. 12mo., cloth.....\$1 50

Quartz Operator's Handbook.

By P. M. Randall.....\$2 00

Skeleton Mining Report.

Of great practical value to miners and mine owners in making a comprehensive report on mining properties. Useful and convenient to mining engineers as a field notebook. Price, postpaid.....\$5 00

Stamp Milling of Gold Ores.

By T. A. Rickard, M. E. An actual record of milling practices in this and other countries. Deals with the erection and management of mills, and contains many helpful suggestions to those interested in the extraction of gold from its ores. Well illustrated. Cloth. Price, postpaid.....\$2 50

Miners' Pocketbook.

A reference book for miners, mine surveyors, geologists, mineralogists, millmen, assayers and metallurgists. By C. G. Wainford Lock. 472 pages, illustrated. Flexible leather.....\$6 00

Manual of Mining.

For the use of Mining Engineers and Technical Schools. Treating of Preparatory and Exploratory Work, Methods of Mining, Hoisting Machinery, Pumping, Ventilation Shafts, Tunnels, Blasting, Timbering, etc., etc. By Prof. Magnus C. Thiesing, E. M., Ph. D. Third, revised and enlarged, edition. 648 pages, 8vo., cloth.....\$4 00

The Lixiviation of Silver Ores with Hyposulphite Solutions.

With special reference to the Russell Process. Second edition. Completely revised. By Carl A. Stetefeldt. Price, bound in cloth.....\$5 00

Market Reports.

The Markets.

SAN FRANCISCO, Sept. 8, 1898.

SILVER.—London, 27½d; New York, 60½¢; San Francisco, 60½¢; Mexican Dollars, 46½¢ @46½¢.

COPPER.—Electrolytic 12½¢; Casting 12c. Lake is reported \$12.25@12.37½. A Boston copper operator says: "The copper market has always been renowned for its brilliant changes and powerful pyrotechnics which would sweep everybody and everything like a cyclone before them, but probably never has a change taken place which took most operators and the Street by such surprise as did the recent one, when Lake copper was weak and depressed at 11½¢ and looked like going to 11 and even 10½¢. But, presto, change, and the market rises from 11½¢ to 12c in a twinkling, and it has since risen so that to-day it can be quoted at 12½¢.

Now what brought about this change? There was no misrepresentation of the condition of the market when it was quoted weak and tending downwards at 11½¢. But Europe saw the end of the Spanish-American war. The war had brought to the front the all important fact that every country in Europe must keep on hand a supply of war material, and copper and coal are indispensable war materials.

"The war had brought to the front the fact that copper was an indispensable material, and European governments, through their recognized agents, sent inquiries to this country for copper, amounting in the aggregate to at least 30,000,000 pounds. This copper was to be shipped, beginning Sept. 1st of this year, month by month for twelve months, and it was only one of several inquiries of similar character, indicating that Europe was prepared to contract for an unprecedented amount of copper at the then ruling prices. Copper, which was weak, at once became strong. European offers were promptly declined, and the price has since risen to its present quotation. Where is it going? When will the advance stop? These are questions for theorists to answer and speculators to dream about. I am simply outlining existing conditions, and to my mind the copper market in the present situation is in one of the strongest positions ever known."

The situation abroad: In 1898 the visible supply of copper on hand July 31 was 57,817 tons, price \$45 7s. 6d. Sept. 1, 1898, this visible supply is reduced to 25,380 tons, while the price has advanced to \$51 10s. 9d.

LEAD.—New York reports "lower and weak" \$4 bid, \$4.05 asked. Smelters quote \$3.90; local, pig, 6@6½¢; sheet, 6½@7c; pig, 5½¢; bar, 6c.

IRON.—American, soft, \$20 and \$22 per ton; Scotch, \$23.

SPELTER.—Unchanged, 5½@5½¢.

TIN.—Menlo Roofing, redipped, 7¢; English, to arrive, \$4.50; Pig, 13c; Bar, 19c.

ANTIMONY.—9½¢, 10.

BABBITY METAL.—10-12-14—best 16c.

QUICKSILVER.—Quiet, domestic \$42.50 @43; export and carload lots, special rates.

POWDER.—F. O. B., San Francisco: No. 1, 70% nitro-glycerine, per lb., in carload lots, 15½¢; less than one ton, 17½¢. No. 1* 60%, carload lots, 13½¢; less than one ton, 15½¢. No. 1** 50%, carload lots, 11½¢; less than one ton, 13½¢. No. 2, 40%, carload lots, 10c; less than one ton, 12c. No. 2* 35%, carload lots, 9½¢; less than one ton, 11½¢. No. 2** 30%, carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 738 kegs, \$1.50 per keg; less car lots, \$2 per keg.

FUSE.—Triple tape, \$5.10 per 1000 feet; double tape, \$4.35; single tape, \$3.45; Hemp, \$3; Cement No. 2, \$4.35; Cement No. 1, \$3.45.

CAPS.—3x, \$5.50 per 1000; 4x, \$6.50; 5x, \$8; Lion, \$9.

COAL.—San Francisco coast, yard prices: Wellington, \$8 00; Coos Bay, \$5 00; Seattle, 6 00; Southfield, 7 50.

Cargo lots, Eastern and foreign: WallSEND, \$7 50; Cumberland, \$10 00; Brynbo, 7 50; Cannel, 9 50; Pennsylvania, hd., 14 50; Welsh Anthracite, 12 50; Scotch, 8 00; Rock Springs, 7 60.

COKE.—Foreign, \$13; domestic, \$12 per ton.

OILS.—California Castor, pure, cs., \$1.12 per gal.; bbl., \$1.07; pure No. 2, cs., 85c; bbl., 50c; Baker's AA Castor Oil, in case lots of 200 gals. and upward, \$1.11; less than 200 gals., \$1.20; in bbls., 4c per gal. less than case; Baker's Crystal, \$1.50; China Nut, 52c; Linseed, strictly pure, boiled, bbl., 43c; cs., 43c; raw, bbl., 41c; cs., 40c; lots of 5 bbls., 1c less; Lucol, boiled, bbl., 38c; cs., 43c; raw, bbl., 36c; cs., 41c; lots of 5 bbls., 1c less. Kerosene—Pearl, cs., per gal., 17c; Astral, 17c; Star, 17c; Eocene, 19c; Extra Star, 21c; Elaine, 22c; Water White, bulk, in tanks, 11½¢; Mineral Seal, in bbls., 21c; wooden bbls., 23½¢; cs., 20c; Mineral Sperm, 27c; Deodorized Stove Gasoline, bulk, 12½¢; do., cs., 18c; 86 deg. Gasoline, bulk, 20c; do., cs., 25c; 63 deg. Naphtha or Benzine, deodorized, in bulk, per gal., 11½¢; do., in cs., 16½¢; Lard Oil, Extra Winter Strained, bbl., 56c; cs., 61c; No. 1 bbl., 46c; cs., 51c; Neatsfoot Oil, bbl., 65c; cs., 60c; No. 1 bbl., 55c; cs., 60c; Sperm, crude, 60c; Natural White, 65c; Bleached do., 70c; Whale Oil, Natural White, 40c; Bleached do., 45c; Cocoa, cs., 55c; Pacific Rubber Mixed Paints, white and house colors, \$1.25@1.35 per gal.; wagon colors, \$2@2.25.

CHEMICALS.—Cyanide of potassium, jobbing, 29 @ 30c per lb.; carloads, 27c; sulphuric acid, 2½¢ per lb. for 60%; soda ash, \$1.60 per 100 lbs. 58%; hyposulphite of soda, 2½¢ per lb.; blue vitriol, 4½¢ per lb.; borax, refined, 5@6c per lb.; chlorate of potash, 9½@10c; roll sulphur, 2½¢; blue

vitriol, 4c; alum, \$1.90@2.00; flour sulphur, French, 2½@2½¢; California refined, 1½@1½¢; nitric acid, 12½@16c; caustic soda, 60%, 2½@2½¢; 70%, 2½@2½¢; 77%, 3½@3½¢; Cal. s. soda, bbls., 65c; sks., 60c @ 100 lbs; chloride of lime, spot, 2.10@2.25c; to arrive, 2.10@—c; saltpeter, refined, 9c; chlorate of potash, 9½@10c; caustic potash, 8@9c.

CORDAGE.—Net rates on not less than 10,000 lbs., subject to change without notice.

Mining Share Market.

SAN FRANCISCO, September 8, 1898.

There was a little stir in Comstocks during the week. There was just enough movement to indicate what would result if speculative influence were manifest. As to this whole business, it can be said, as it has been said before of similar situations, that superficial observers sincerely believe that in stock operations skill and judgment count for nothing, but that results are determined, if not by pure luck, at least by causes so deeply hidden from human observation that no calculation can be made in regard to their working. Hence, all the business of stock exchanges is, in their eyes, nothing but gambling, like staking money upon the turning of cards or the fall of dice. On the other hand, many people seriously entertain the conviction, not only that the result, good or bad, of stock operations, is not due to luck, but that it is produced by the exercise of a skill resembling that of sharpers who use stacked cards and loaded dice. What seems to be mere chance, is, in their opinion, the outcome of maneuvers of questionable honesty. It is needless to say to those who are familiar with the course of business on the stock exchanges that both these views are erroneous, and that the truth without lying between them is a compound of both. So far as stock operations are governed by influences which cannot be discovered or foreseen, or so far as the influences which affect them are, though visible, counteracted by others not visible, their result may be said to depend upon luck. So far again as a few sagacious men discern coming events in advance of the crowd, or as a few unscrupulous wire pullers are apt to impose upon the public a belief in the false views, they may be said to profit by their skill. Inasmuch, however, as the laws of nature are immutable, the skillful man who acts upon principle has always an advantage, to which he is honestly entitled, over him who acts upon the impulse of the moment, without reflection.

"The price of a security is the concurrent estimate of its value arrived at between the buyer and the seller, after considering, more or less carefully, the facts which go to constitute it. The trouble with most operators in stocks is that they take no pains, in the first place, to ascertain the facts bearing upon the values of securities they buy and sell; and next, they rely not upon their own judgment in buying and selling, but upon what they conceive to be the judgment of other operators. A disadvantage under which amateurs in the stock market almost always labor is the want of sufficient capital. Their usual mode of operation is to buy for a rise, that being the way of doing business with which they are familiar, whereas selling for a fall is foreign to their habits, and but few of them like to undertake it. When they buy, too, they are not content to limit their purchases to the amount of money they possess of their own, but they buy ten times as much, putting up their own money as a margin. The result is that if the market goes against them, even for one day more than to the extent of their margin, they are compelled to sell out and lose the whole of their investment, whereas if they took only what they paid for in full they could hold it through the crisis

Mines or prospects operated on contract to purchase, or under lease on fixed royalty or percentage.

Money loaned mines.

Mining companies organized, their property experted, financed and managed.

Mines, prospects, mineral lands, mining securities, contracts, bonds, stocks, leases and options bought and sold or negotiated.

Examine mines, prospects and mineral lands as to their value, method of working and condition of their titles. Assay and chemical work done.

Placer Miners' Attention

Is called to the fact that we are purchasers of

OSM-IRIDIUM

In lots of one ounce and upwards.

SELBY SMELTING & LEAD CO.,

416 Montgomery Street, San Francisco.

FRESNO, June 25, 1898.

Hercules Gas Engine Works,
San Francisco, Cal.

DEAR SIR:—

The fifteen-horse power gasoline engine and hoist purchased from you is doing fine work and is perfectly satisfactory in every respect.

Yours truly,

TUOLUMNE MOTHER LOPE
M. & D. CO.,

Per N. W. Moodey, Pres.

We have two large books full of testimonials; they speak better for the HERCULES than we can. Our works are the largest in the country. We have built and sold over 3500 engines; they are the standard everywhere. Any size up to 200 H. P. Stationary, Hoisting and Marine.

Hercules Gas Engine Works,

405-407 SANSOME STREET,

SAN FRANCISCO, CAL.

and until a more favorable opportunity for withdrawing. Amateurs, however, have this advantage over the professionals, that they need not come into the market unless they choose, and when they stay out, as most of them seem to be staying out now, the professionals are reduced to dealing with one another, and, being evidently matched in point of skill, their profits are small. Over both the amateur and professional operator in stocks hover the uncertainty of all human affairs and the possibility of the happening at any time of the unexpected. It is, therefore, not luck alone nor skill alone which determines the results of stock speculations, but a compound of both. On the whole, a man with skill is more likely to win than one who is destitute of it, because he can turn even bad luck to his advantage and snatch victory from the jaws of defeat; whereas the man dependent on luck alone has no choice but to submit to the course of events, even destruction."

Gold Mine for Sale.

Eight Claims on Mother Lode, Calaveras Co., Cal. Twenty-stamp mill building, and ten stamps. Some development work done years ago, including shaft 500 feet deep. Trustee offers at low price. For particulars address KNOX, care Mining and Scientific Press.

MOTHER LOPE MINE FOR SALE.

THREE CLAIMS UNDEVELOPED AND IN close proximity to several best paying mines of Tuolumne Co. Address OWNERS, care Mining and Scientific Press.

FOR SALE.—THE SHASTA CO. SAMPLING WORKS. A complete plant for the sampling of ores, gasoline engine, crusher, assay outfit, ore bins, etc., etc. Address O. H. S., this office.

NOTICE.

Parties having Mining or Milling Machinery for Sale, or those wishing to purchase same on easy terms, please call at our address.
ASSAY OFFICE, 10 Stevenson St., S. F.

POSITION WANTED

By Superintendent of Mine and Mill, Having twenty years' experience in assaying, mining and milling gold and silver ores, and bullion refining.

Also familiar with the separation of gold from copper without acids, as practiced in Colorado. Have served four years as assayer in U. S. coinage mint. Address "Mine Supt." Mining and Scientific Press Office, San Francisco, Cal.

POSITION WANTED

By Experienced Chemist and Assayer. Cyanide Treatment a Specialty. Address CYANIDE, Mining and Scientific Press Office, San Francisco, Cal.

WANTED

GENERAL SUPERINTENDENT

Having experience and perfect knowledge of mining large bodies of ore, and familiar with square setting. Man now occupied in this position preferred. Prefer mining engineer having a knowledge of milling and machinery. Good salary, with chances of advancement. Address only in confidence LOCK BOX NO. 1252, SALT LAKE CITY, UTAH.

Mine and Mill Superintendent

Will be open for an engagement Oct. 1, '98. Highest References Furnished.

Can also do Mine Surveying, Mapping and Assaying. Competent to take full charge of a gold or silver property anywhere.

As to terms, qualifications, etc., address F. G., Mining and Scientific Press Office, San Francisco.

Mine Wanted.

Man of experience will develop gold mine for ¼ interest, or will bond whole property and develop. Must have ore chute IN SIGHT. State exact conditions. Correspondence with owners only. Address P. O. Box 887, Los Angeles, Cal.

WANTED.

METALLURGIST and PRACTICAL SMELTER

Will be open for engagement October 1st as Superintendent of Copper or Lead Smelting Works.

Thoroughly competent in analyzing, assaying, and handling men. Speaks Spanish. Excellent references. Address SMELTER, care Mining and Scientific Press.

WANTED.

Partner in Extensive Placer and Quartz Mines. Free wood and water. JAMES ARTHUR, Cornucopia, Union Co., Oregon.

COPPER MINES WANTED

— ALSO —

A Good Dividend = Paying Gold Mine.

Address "MINING ENGINEER," P. O. Box No. 1, ROSLINDALE,.....MASS.

Notice of Stockholders' Meeting.

A meeting of the Stockholders of the Portillo Diaz Gold and Silver Mining and Milling Company will be held at the office of the Corporation at the Undertaking Parlor of Craig, Cochran & Co., at 54 Mint Avenue, San Francisco, California, on TUESDAY, the 27th day of September, 1898, at 1 o'clock p. m., for the purpose of electing Directors of said Corporation to serve until the 23rd day of August, 1899, and until their successors are elected.

This notice is given by the order of Stockholders holding more than one-half of the votes and more than one-half of the Capital Stock of said Corporation, to-wit: L. W. Hilliker, Thos. Ryder, E. Fitz, Peter Salting and Jos. I. Davis, and pursuant to call in writing made by them and now on file with the undersigned. W. A. STEPHENS, Secretary.

Dated August 29, 1898.

DELINQUENT SALE NOTICE.

BOULDER MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, El Dorado County, California.

Notice.—There are delinquent upon the following described stock on account of assessment (No. 1) levied on the 27th day of July, 1898, the several amounts set opposite the names of the respective shareholders, as follows:

| Name. | No. Cert. | No. Shares. | Amt. |
|-------|-----------|-------------|------|
|-------|-----------|-------------|------|

Mrs. Marie Malson.....18 1000 \$50 00

And in accordance with law, and an order from the Board of Directors, made on the 27th day of July, 1898, so many shares of each parcel of such stock as may be necessary will be sold at public auction, at the office of the Secretary, room 163, Crocker building, San Francisco, California, on MONDAY, the 26th day of September, 1898, at the hour of 2 o'clock p. m. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

Office—Room 163, Crocker building, San Francisco, California.

DELINQUENT SALE NOTICE.

WEST SANTA ROSALIA GOLD MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, State of Sonora, Mexico.

Notice.—There are delinquent upon the following described stock on account of assessment (No. 1) levied on the 3rd day of August, 1898, the several amounts set opposite the names of the respective shareholders, as follows:

| Name. | No. Cert. | No. Shares. | Amt. |
|-------|-----------|-------------|------|
|-------|-----------|-------------|------|

And in accordance with law, and an order from the Board of Directors, made on the 3rd day of August, 1898, so many shares of each parcel of such stock as may be necessary will be sold at public auction, at the office of the company, No. 310 Pine street, Rooms 15 and 17, San Francisco, California, on MONDAY, the 26th day of September, 1898, at the hour of 1 o'clock p. m. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

Office—No. 310 Pine street, Rooms 15 and 17, San Francisco, California.

Assessment Notices.

CONSOLIDATED ST. GOTHARD MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Nevada County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 11th day of August, 1898, an assessment of \$5.00 of ten (10) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, at the office of the company, 113 Crocker building, sixth floor, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 26th day of September, 1898, will be delinquent and advertised for sale at public auction, and unless payment is made before, will be sold on WEDNESDAY, the 12th day of October, 1898, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors. J. F. HOLLING, Secretary. Office—113 Crocker building, sixth floor, San Francisco, California.

NATIONAL CONS. MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Rich Gulch, Shasta County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 22nd day of August, 1898, an assessment (No. 4) of ten (10) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 916 Market street, Room 57, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 3rd day of October, 1898, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 31st day of October, 1898, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors. GEO. W. FLEISSNER, Secretary. Office—No. 916 Market street, Room 57, San Francisco, California.

JUNCTION MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Tuolumne County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 8th day of August, 1898, an assessment (No. 20) of three (3) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the secretary, at the office of the company, 100 Leidesdorff street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 12th day of September, 1898, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 3rd day of October, 1898, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors. CALVERT MEADE, Secretary. Office—106 Leidesdorff street, San Francisco, California.

LEON GOLD MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, near Winchester, Riverside County, California.

Notice is hereby given that at a meeting of the Board of Directors, held on the 16th day of May, 1898, an assessment (No. 1) of 1 1/2 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, room 7, fifth floor, Mills building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 25th day of June, 1898, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 25th day of July, 1898, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors. R. L. CHENEY, Secretary. Office—Room 7, fifth floor, Mills building, San Francisco, California.

POSTPONEMENT.

By order of the Board of Directors of the Leon Gold Mining Co., the day of delinquency of the above assessment is postponed to July 9th, 1898, and the day of sale to MONDAY, August 8th, 1898.

Office—Room 7, fifth floor, Mills building, San Francisco, California.

POSTPONEMENT.

By order of the Board of Directors of the Leon Gold Mining Co., the day of delinquency of the above assessment has been postponed to August 6th, 1898, and the day of sale to MONDAY, September 5th, 1898.

Office—Room 508, Safe Deposit building, Cor. California and Montgomery streets, San Francisco, Cal.

POSTPONEMENT.

By order of the Board of Directors of the Leon Gold Mining Co., the day of delinquency of the above assessment has been postponed to September 3rd, 1898, and the day of sale to MONDAY, October 3rd, 1898.

Office—Room 508, Safe Deposit building, Cor. California and Montgomery streets, San Francisco, Cal.

POSTPONEMENT.

By order of the Board of Directors of the Leon Gold Mining Co., the day of delinquency of the above assessment has been postponed to November 1st, 1898, and the day of sale to TUESDAY, November 1st, 1898.

Office—Room 508, Safe Deposit building, Cor. California and Montgomery streets, San Francisco, Cal.

To Our Customers and Friends on the Pacific Coast:

Through frequent complaints made to us, we have learned that unprincipled and dishonest dealers on the Pacific coast have counterfeited our trademark numbers and substituted inferior, spurious goods as ours, when ours were distinctly ordered, thus defrauding the customers and injuring our trade and reputation.

Our goods are acknowledged to be the best, and are fully warranted by us, and are marked with our name or initials or with our well-known trademark and catalogue numbers.

We request direct notice if any goods alleged to come from us, or bearing our trademark or numbers, prove to be other than the best, and perfect in every respect, as we will follow up and expose such frauds for our customers' and our own protection. We have no exclusive agents on the Coast, but our goods are obtainable from all respectable dealers in drawing materials, stationery, hardware, artists' material, etc. Respectfully,

KEUFFEL &

ESSER CO.,

New York.

FOUR and SIX-FOOT FRUE VANNERS

With Brownell "Patent Lip" Flange Belts.

STANDARD MACHINE OF THE WORLD.

When a Concentrator like the Frue Vanner has been on the market nearly two decades, and the sales have constantly increased, it is safe to say it is the "Standard Machine of the World." More Frue Vanners have been sold during the last twelve months than for the same period at any time during the history of the machine. Practical mining men in all parts of the world where mining is carried on will testify as to its merits. It is the "standard" which all competitors are trying to imitate.

The results obtained by this machine are the "acme" of concentration, and several cheap and untried machines that have lately come on the market compare by it. The manufacturers will tell you that they are "just as good, and cheaper," etc. The facts are that no other concentrator made has an equal capacity, or will yield as clean a concentrate with as small loss in the tailings as the Frue Vanner. The amount saved from the lower first cost of an inferior machine counts little in the year's results, when compared with the increased output from a Frue. This machine not only gives better results at both ends of the belt (i. e., clean product and poor tailings), but is operated at less expense and requires less attention than any other machine on the market. At the Alaska-Treadwell mine, where they have ordered over 350 Frue Vanners, one man attends 48 machines for 12-hour shift.

Some Further Arguments.

The editor of this paper has at times been urged to advance some further arguments regarding the propriety and necessity for the creation of a national department of mines and mining, in addition to those that have already appeared herein. While it is believed that the reasons already advanced are sufficient, yet it may be in order to make additional appeal to the general sense of justice which underlies all public movements in our country.

In the United States the highest tribunal is public opinion. We had a good illustration of that in the late war. Were the merits of this matter thoroughly appreciated by the mining world, the creation of a Cabinet department—a Secretary of Mines and Mining—would be hastened. So long as the question is advocated on local lines, and in a local way; so long as the miner in West Virginia, or Montana or Michigan is permitted to continue of the opinion that the idea is merely an effort of some ambitious California or Colorado or Utah man to achieve notoriety or create a place with a probable chance of filling it, so long the question will be overcome by the tremendous inertia of indifference. When the Michigan copper miner, the Ohio coal miner, the Alabama iron miner, the California gold miner and others can mutually realize that the matter is of common importance and to each an individual necessity, the leaven will work—and not till then. In such things, requiring realization of the identity of interests, our nation is so vast that the movement is necessarily slow. We of the mineral region, the west half of the continent, are partially awake to the needs of the nation's great basic industry. We need the aid of our Eastern co-workers. When they can be shown that this is not a matter of free coinage, nor politics, nor personal hope, nor sectional ambition, the work will be greatly advanced.

Probably the best additional argument that the writer can cite is the fact that our national government has recognized other functions and requirements no more sectional in their scope or character than the great mining industry, as justifying national supervision and administration. Railroads, commerce, agriculture, river and harbor improvement, forestry, the weather, life-saving, mail service, lighthouses, revenue, coinage, receive national recognition and are under governmental control. The great industry that underlies all others has not even a representative clerk in a division in a sub-bureau in a department at the national capital. The late war is an exemplification of the principle underlying our form of government: that the national government should do nothing that any other lesser control can do as well, but when any supervision or direction becomes necessary, that the United States Government can do better than any local agency, it is the province and duty of the Federal Government to take charge thereof. In the late war no State or Territory could cope with Spain; it required supreme Federal authority, the exercise of the national power vested in the Government at Washington, D. C. This principle is so fully established and conceded as to merely require allusion. If in war, or in the pursuits of peace as cited above, why not to other matters of similar national scope? It is only the national Government that can assume charge of so national an industry as mining. No State legislature can properly administer the necessary control, regulation and manifest needs of so great an industry. Interests common to so many different States de-

mand that the common government assume control. In many instances, notably those cited, the national Government recognizes its duty and fulfills it. No less is it the duty of the Federal Government to fill the just measure of demand by the mining industry. "Duty" means what ought to be done; what should be done; that which is plainly and manifestly required of some controlling, directing or governing power interested in the common welfare. This duty the U. S. Government has constantly shirked, disregarded or but partially filled in anything connected with its greatest industry—that of mining. Parsimony and pettiness has characterized the Federal record throughout. This is not a complaint; it is the simple statement of a fact. Take the history of the U. S. Geological Survey, where zealous work, intelligent direction and hearty effort have been hampered and stultified by lack of necessary appropriation. Pettifogging Congressmen peddling seeds gratis (at Government expense) to bucolic constituents, to aid in securing retention of place, are sometimes unable to see the plain path of national duty and governmental requirements.

Much is given and little required from the Government. Nothing but aroused public opinion among the mining men of the United States can bring recognition of the importance of the mining industry by the Federal Government. It is to the creation of favorable public opinion that the advocates of this new departure must address themselves. The present stupid and discreditable ignoring of this matter by the Federal Government does not tend to enhance national self-respect, and is opposed to the first primary rules of business.

A Hand Rock Drill.

To many a miner mention of a hand rock drill usually occasions a smile, and a disparaging remark regarding such a thing. Still, even those who decry hand drills must admit that there is often practical need of that device. The Jones hand rock drill is claimed by its makers to be just what is required: "strong, reliable, simple, light, easily handled by one man, and cheap." The drill, unmounted, weighs about 75 lbs., the column about 45 lbs. It is claimed to be easy of operation in any place or position in which the ordinary drill and hammer can be used. The drill is rotary, the bit revolving one full circle every twenty-two strokes. The manufacturers believe it possesses "the only perfect self-feed ever

invented." There are a good many special features about it that commend it to the attention of practical miners. The illustration shows the drill mounted for lifter hole. The drill is manufactured and sold by the E. P. Allis Co. A treatise giving completed detailed illustrated description of the drill will be sent to any address upon receipt of request by the Pacific coast agency, 9 Fremont St., San Francisco.

The Sonora Folio.

The Sonora, Cal., Folio adds another to the increasing number of valuable maps which the United States Geological Survey is issuing for the gold belt. The area of this folio is about equally divided between Mariposa and Tuolumne counties, the "mother lode" extending diagonally across it nearly through the center.

Embracing, as it does, so much of the main gold belt of the two counties, it ought to be of great value to those interested in mining. The only criticism to be passed upon it from the miner's standpoint, and one to which the other folios are subject, is that of the scale. It would seem that if the sheets covering the main gold belt were twice the scale their usefulness would be greatly increased. The original topographic sheets are on a larger scale, that of one mile to the inch, and if the geologic maps had been made the same all the mines as well as geologic features could have been placed upon them. It seems that miners generally do not seem to know of the existence of these folios, or how to obtain them. They are sold at such a reasonable price—generally at 25 cents each—that they are within the reach of all, although, as it is, those practically interested often get the least benefit from them. It would have been well, also, if in some of this work the State could have co-operated, as other States have, with the United States Geological Survey, and thus made the maps easier to obtain and more widely known. If collections of rocks illustrating the different formations bordering the mother lode were accessible to miners, it would aid very greatly in appreciating and understanding the maps, which have been gotten up at so much cost.

The maps are valuable not only to the miner, but to the engineer and the scientist. The language of the large amount of information which is there condensed into a few pages is necessarily somewhat technical and not always easily understood by every one. An added duty devolves upon the State, either through the University or the Mining Bureau, to make systematic effort for the dissemination of the elementary principles of mineralogy and geology through the mining communities. The characters of the common minerals, the more simple classification of rocks and of the different geological formations of the State could be appreciated and understood by the miner, and it is not his fault that the publications, which might be of great value, are sometimes beyond his reach. It is not necessary to call everything "granite," "porphyry," or "slate," for the miner to appreciate the classification. His observational powers are good and it is only necessary for him to have the classification indicated to have it understood in a more rational manner.

One of the most important means of dissemination of more scientific knowledge of the earth and its minerals is through the great schools, and those at their head are oftentimes remiss in not insisting that educational work should in the mining communities be more specifically adapted to the needs of the people.

A Trade School.

Some time ago a resident of San Francisco left by will a large sum of money for the establishment and maintenance of a trade school for boys in San Francisco to be under the direction and control of the Board of Regents of the University of California. By request of the Board, Mr. A. S. Hallidie, one of the Board, visited several Eastern institutions of a similar character to the proposed school during the months of June and July, '98, and made considerable practical research and inquiry, consulting men conversant with conducting such a school as Mr. Wilmerding desired to establish, "to teach boys trades fitting them to make a living with their hands, with little study and plenty of work." As a result of his visit, Mr. Hallidie says:

"In my judgment the existing examples to be studied are the New York Trade School, the Baron de Hirsch School and the Master Builders' Mechanical Trade School as one type and the Williamson Free School of Mechanical Trades as the other. And whoever is selected to take charge of the Wilmerding School should be given two or three months to carefully examine into and study the workings and results of these schools, to note the details of construction of the buildings and their equipment. He should then make a careful study of the conditions on the Pacific coast generally, and of California and San Francisco particularly, and prepare his scheme of instruction, the plan of building and their equipment. If the Wilmerding School is planned somewhat after the Auchmuty system, no expensive machinery will be required; if after the Williamson plan, a large investment in machines and apparatus will be necessary. The man to take charge of the Wilmerding School should be an educated mechanic, with ability to teach. He should have had experience in some such institution as the proposed Wilmerding School and have administrative ability. I do not think we would care to carry out the Williamson plan, and the Auchmuty system probably should be modified to suit the conditions which exist here and the character of the trades to be taught. It must be borne in mind that no school has yet succeeded in turning out a mechanic ready to take up the work of a shop. This is acquired, however, in a short time after leaving the school. It has, however, been proved to the satisfaction of those interested that a young man, by steady and assiduous work; by careful, concentrated and intelligent attention to instruction given in an earnest, clear and simple manner, by teachers who know more than they teach, and who are able to impart instruction from experience based on broad lines, can be taught the intricacies of manipulation in many trades in five and one-half months. There are trades, however, that will take three such terms, and the length of time should be graduated to the character of the work to be taught. While in the school the pupils are more than anxious to learn, and consequently things are kept somewhat under high pressure by general consent. The age of the youths, sixteen and up, and the good bodily health necessary for the physical labor required in such a school enable them to endure eight hours work for these short terms without mental and physical fatigue. The fatigue, in fact, is with the teachers.

"I have conferred very freely with men in and out of these schools in relation to the question, Shall articles be made in the school to be sold? The verdict is generally in the negative. The Worcester Polytechnic Institute supports the commercial view

and makes it part of the shop system. Quite a staff—thirty, I believe—of skilled workmen are employed throughout the year. Contracts are taken and executed, and the young men get their training in the shop, working at stated hours with and under the direction of these skilled mechanics. It is doubtful if the best results are attained in this way, for if the young men without experience have a chance at the work, the work must suffer and the commercial value of the same is reduced. If the commercial aspect has to be considered at all, it must be subordinate to the educational. Whichever plan is carried on, the other will suffer. With the commercial the temptation is to keep a youth at work on that which he does best and quickest, and thus limit the field of his experience; per contra, if a thing is made and put on the market, its commercial value is fixed, and perhaps the ambition of the youth is aroused.

"Shall Wilmerding School be free? The opinion of the three schools I have referred to considerable at length is against free instruction, and this is the opinion of gentlemen in California and of nearly all those connected with the management of manual training schools with whom I have conferred.

"In trade schools there is a great deal of material destroyed and wasted, and the New York Trade School charges are to cover the cost of the same, and no more. A great deal depends on the management of the school, but as much also on the convenience and healthfulness of location, adaptability of buildings and cheerfulness of surroundings. The proper sanitary condition of the neighborhood must be assured. Of this there must be no doubt. The immediate surroundings of the different workshops should be in accord with the trade being taught. Everything should be done to impress the student with that one idea—concentration of mind is essential to success."

Before leaving San Francisco on his Eastern trip, Mr. H. submitted to several prominent men identified with industrial pursuits in California some questions, which, with their replies, are here given:

Queries as to the School: 1.—What trades should be taught? Please name in order of your preference. H. J. Small, Superintendent Motive Power, Southern Pacific Railroad Company, Sacramento City: "Machinist, pattern maker, boiler maker, coppersmith, cabinet maker, molder, steam fitter." John F. Merrill of Holbrook, Merrill & Stetson, San Francisco: "All prominent and useful trades." James Spiers of Fulton Engineering and Shipbuilding Works: "General mechanics, including pattern making, machine shop, foundry, blacksmith shop and foundry, if possible, electrical machinery, carpenter trade, cabinet work, farming work." Asa R. Wells of Wells, Russell & Company, Planing Mills, etc.: "Iron work, electricians, architects, naval construction and engineering." Geo. W. Dickie of Union Iron Works: "Trades being commercially applied within a reasonable distance of the school. Working in iron and wood, cabinet making, all kinds of brass work, molding and casting, work in leather." Irving M. Scott: "All trades possible, especially wood and iron."

2.—Should other than practical instruction be given? H. J. Small: "Yes." John F. Merrill: "No." John Spiers: "Yes." Asa R. Wells: "Yes." Geo. W. Dickie: "Practical instruction should be illustrative. Scientific instruction needed also." Irving M. Scott: "All instruction possible will add to efficiency."

3.—If "Yes," please state the character and limit of such instruction. H. J. Small: "Pupils should be fully instructed in the theory of the trade he selects; also in the mathematics necessary for such trade." James Spiers: "Scientific branches of education relating to the trade or industry should be given." Asa R. Wells: "Technical studies and general information in the practical things of life." Geo. W. Dickie: "Instruction in the different kinds of scientific knowledge that have a direct and practical bearing on industrial production." Irving M. Scott: "Theory and principles, customs and state of the art."

4 and 5.—To what extent should the pupils be taught the use of hand tools; of machines? Replies from all: "Say to fullest extent; of machines, limited by funds available."

6.—Should instruction be free? H. J. Small: "Think it would be more appreciated if a charge was made." John F. Merrill: "No; if the pupil is able to pay even a small fee." James Spiers: "By charging a small fee, I think better attention is secured; but provision should be made for those unable to pay." Asa R. Wells: "No, not entirely so, except in special cases." Geo. W. Dickie: "Depends on class of pupils to be reached. If children of poor parents, instruction should be free. I am afraid that the class of pupils most desirable to reach can not be reached even by free instruction. Such a school could only reach those that most need its help by paying the pupils to attend." Irving M. Scott: "By no means. Teach the value of labor and earnings."

7.—Should the product of the pupils' work be put on the market? H. J. Small: "Think possibly it would be an advantage to place product on market, and solicit custom work. It would have the effect

to necessitate closer work and familiarize pupils with the commercial features of the trades." John F. Merrill: "Think it would have to be. Trades unions might object." James Spiers: "Yes." Asa R. Wells: "Yes; in the spirit of emulation." Geo. W. Dickie: "I should say certainly, if it can compete. The market itself would settle that question." Irving M. Scott: "Work should consist of making articles now imported."

8.—When practicable should custom work be sought? H. J. Small: (See answer to No. 7.) John F. Merrill: "I think not. That would make a direct competition with all factories and shops, and defeat the object for which the school is to be established." James Spiers: "Yes. When an article forming a good subject for education is in the market. * * * The proceeds from sales extends the school's usefulness." Asa R. Wells: "No; for the reason that trades unions would protest." Geo. W. Dickie: "Yes, if practicable; which I doubt." Irving M. Scott: "All work should be made with a view of being used to replace articles imported. With no interest, wear and tear, salaries or wages to pay, the school should be able to shut out the foreign article and build up a home product, by which some of your students will finally establish themselves in good paying enterprises, greatly to the benefit of the State. Kindergarten and show articles fill the community with sham artificers, and do not teach the mercantile value of the cost of products."

Queries as to the Principal: 1.—Should the principal be a practical mechanic? Replies from all, "Yes," except Geo. W. Dickie, who says: "In selecting a principal an effort should be made to get a man of wide experience in that kind of education, by securing the services of some one who has made a reputation in a similar institution. Where he comes from, where he has been taught, what his age is, should not form factors; but simply what the man is, and what he has done in the line of work he is sought for."

2.—In what branch? H. J. Small: "Machinist preferred." John F. Merrill: "Master mechanic, and possess general knowledge of different trades." James Spiers: "Mechanics, or general engineering." Asa R. Wells: "At the bench, or head of skilled labor." Geo. W. Dickie: (See answer to No. 1.) Irving M. Scott: "Many as possible."

3.—Should he have had experience in teaching? H. J. Small: "It would be an advantage." John F. Merrill: "Should be a practical man; well qualified to teach and explain intelligently." James Spiers: "If possible; but not necessary." Asa R. Wells: "Yes; for teaching is an art as well as a qualification." Geo. W. Dickie: (See answer to No. 1.) Irving M. Scott: "Yes."

4.—Should he write and speak English correctly? Replies from all: "Yes."

5.—Should he understand the higher branches of mathematics? Replies from all: "Yes." "With some qualifications" (J. F. Merrill).

6.—Should he understand the theory of applied mechanics? Replies from all: "Yes."

7.—Should he be a good draughtsman? H. J. Small, John F. Merrill, Geo. W. Dickie and Irving M. Scott reply: "Yes." James Spiers and Asa R. Wells: "Not necessary; but should understand drawing."

8.—Should he be a good executive officer and administrator of affairs? Replies from all: "Yes."

9.—Should he have a practical knowledge of book-keeping? H. J. Small, Asa R. Wells and Irving M. Scott: "Not necessary." John F. Merrill and James Spiers: "Yes."

10.—Are there any reasons why the principal should have resided in San Francisco or California for any length of time? Replies from all, "No," except Irving M. Scott, who says: "Only that he may be familiar with Western methods. High interest and wages, no iron, coal, or hardwood, are the problems in profits that must be worked out here on an entirely different basis than those used east of the Rocky mountains."

11.—What should be his age? John F. Merrill: "From thirty to forty years." James Spiers: "From thirty-five to forty-five years." Asa R. Wells: "Not over sixty-five years." Irving M. Scott: "Immaterial, so long as he is full of vigor, mentally and physically."

Queries as to the Pupil: 1.—What class of boys should have the preference in admission? H. J. Small: "There should be no restriction." John F. Merrill: "Boys of limited means, who are compelled to earn their living by manual labor and are anxious to learn a trade." James Spiers: "Those who by their condition will be dependent on the use of their hands for a living." Asa R. Wells: "Boys of good common school education, whose parents, if they have any, are citizens of the United States and live in California." Geo. W. Dickie: "The class of boys should be from the families of working people, as those most likely to derive benefit from such a course of instruction." Irving M. Scott: "Those with an aptitude for mechanical training."

2.—At what age should they be admitted? H. J. Small: "Fifteen to seventeen years." John F. Merrill: "Fifteen to seventeen years." James Spiers: "Sixteen to eighteen years, with exceptions." Asa R. Wells: "Fifteen to seventeen years." Geo. W.

Dickie: "Twelve to fifteen years. After three or four years in such a school, the boys would still have to serve an apprenticeship to any trade they might choose, and for that reason they should leave the schools at from seventeen to eighteen years old." Irving M. Scott: "Fourteen years; although much depends upon the boy's intelligence."

3.—On what qualifications? (a), as to character; (b), education; (c), physique. H. J. Small: "(a), good; (b), grammar school graduate." John F. Merrill: "(a), good moral character; (b), grammar school education; (c), good, robust physique." James Spiers: "(a), good; (b), fair primary education; (c), good, healthy body." Asa R. Wells: "(a), good moral character and aptitude for mechanics; should be excluded if addicted to intoxicants or cigarette smoking; (b), rudimentary; (c), unless crippled or deformed, his physique should not exclude him." Geo. W. Dickie: "(a), read English language fluently, write clearly, and perform quickly the ordinary computations required in the trade he proposes to learn; the school should be responsible for his character, as he is too young to have formed any distinct character; (b), included in a; (c), rules should be broad enough to embrace any physical condition. Irving M. Scott: "(a), honest and industrious; (b), immaterial; aptness for trade selected more important; (c), free from hereditary or acquired disease."

4.—Should rudimentary instruction be given as a grounding before giving instruction in any special trade? H. J. Small, John F. Merrill, James Spiers and Geo. W. Dickie reply "Yes." Asa R. Wells: "Would be well to a limited extent; but most boys, fifteen to seventeen years, know the bent of their capabilities." Irving M. Scott: "No; but should accompany instruction in trade."

5.—Should the principal or the pupil select the trade? H. J. Small: "Inclination of pupil should be considered." John F. Merrill: "The pupil, with advice of parents and principal." James Spiers: "The pupil; but the principal may advise." Asa R. Wells: "The principal's judgment should have great weight; but the pupil should be reconciled, if consistent." Geo. W. Dickie: "If principal and pupil do not agree, pupil would not derive much benefit from remaining in school." Irving M. Scott: "Pupil."

James Spiers' Notes.—A.—The words "little study and plenty of work" were evidently used by Mr. Wilmerding to express his desire that some "study" of a scientific character should be given; but that chief prominence should be given to the education of the hands to "work," so as to enable the scholar to earn a living for himself and family by the intelligent use of his physical powers, and to do this intelligently a certain amount of study (scientific) is necessary, and which Mr. Wilmerding desires the scholar should have. B.—There are many industries requiring the work of the hand that seems to me cannot come within the reach of a trade school; also, that a trade school, with limited means, must confine itself to but few trades, in order to be efficient, so that the choice of trades or industry to be taught will be mostly a matter of expediency.

Irving M. Scott's Remarks.—Referring to some of these queries, for instance those in regard to Principal, from Nos. 1 to 8 inclusive: it would be difficult to find all these qualities in the possession of one individual, although it would be of great advantage to do so.

In case of inability to find such a principal, I should lay more stress upon No. 8 than any of the others, as a good executive officer and administrator of affairs will reinforce all the weak points, supply all necessary requirements, and make a complete and successful solution of the whole question, while he will fail in everything if he has not high executive qualities.

In reference to the query as to the age of the pupil: there should be no rigid rule as to age, which should be governed by the applicant, as some boys are better suited at twelve years than others are at fifteen, while others are not suited at all, and there are cases where boys should be admitted even as old as nineteen. But I am of the opinion, judging from the observation of a large number of boys for a great many years, that the character of the boy is formed between the age of thirteen and seventeen years; therefore, I am firmly convinced that the boy who is taught habits of industry during those years becomes a useful member of the community, and, if he is not rigidly held to some occupation or calling, he is apt to become careless and one of the hoodlum class; consequently, I think it is of the utmost importance to teach boys habits of industry and learning from thirteen to seventeen years.

As to the education of a boy learning a trade: education is not absolutely necessary to make what is called a good workman; but it is absolutely indispensable in making what is called a leading or master workman, or a workman with executive ability. However, a good honest boy with intelligence will learn as rapidly while learning his trade as at any other time, and will pick out the more solid and substantial facts that bear on the trade he is following, and therefore a lack of education, if the boy has natural ability, should not prevent him from being admitted.

As to your queries in regard to the school, Nos. 7

and 8: there is a very large amount of what is known as heavy hardware, which is made in the different prison factories, and under conditions which do not exist on this coast, yet the conditions under which these articles are manufactured make the price; for instance, such articles as blacksmith's tongs, sledges, sash-weights, barndoor hinges, lawn mowers, all of which could be easily manufactured in a technical school. They should be sold, not retailed, to wholesale dealers, and an effort made to quietly supply their trade and diminish their importations. This will injure no one on this coast, and will get people in the habit of buying home products, which in the end will be of great benefit to the entire coast.

In response to a request for further views on the matter, Mr. Hallidie sends the following:

TO THE EDITOR:—There are few boys who do not take an interest in mechanical pursuits, and nothing is so pleasing to them as the knowledge that they can make something useful. And there is a period in boyhood when the habit of industry can be fixed; this period does not come at a stated age, but if the parents will watch they will perceive its development, and then is the time to encourage and to give opportunity for its growth.

Our best boys are those who are industrious; our worst those who are indolent, but indolence in a healthy boy is unnatural, hence the result of indolence is vice, then crime; for this the parents are responsible primarily, the State in the second instance.

I am not saying anything new; it has been stated time and time before, but I would like to emphasize the great truth. A community, like an individual, to be happy must be industrious. Wherever you find an industrious community there you will find schools, libraries, churches and other evidences of comfort, intelligence and progress. Fortunately we have men possessed of wealth who recognize this truth, and among them was the late Mr. J. Clute Wilmerding of this city, who left \$400,000, now increased to \$460,000, to found an institution to teach boys trades. Mr. Wilmerding did not care for academic education, but wanted them taught how to earn a living by their hands "with little study and plenty of work."

Col. Auchmuty of New York was imbued with the same idea when he founded the New York Trade School, and the Baron de Hirsch when he founded his school to teach Russian and Roumanian Hebrew youths trades.

In 1875 I made an extended tour of investigation through the United States and Europe to ascertain in what way the Mechanics' Institute of this city could develop the idea of industrial education in its application to the California youth. I spent half my time for the Mechanics' Institute for ten years building it up, with the hope that something could be done in that direction, only to be disappointed in results at the end. On my return from that tour I embodied the result of my observations in an address on "Trade Tuition: Its Status at Home and Abroad," delivered before the Mechanics' Institute, which was published in a pamphlet of thirty-four pages. Since then I have kept more or less in touch with the subject, and, as you will see from the report to the Regents of the State University, have quite recently returned from a tour of investigation in the same direction.

The various States are well supplied with manual training and technical schools, and the advance in this direction is wonderful since my observations in 1875. The field is well covered and the results satisfactory. Trade schools are still in the experimental stage and none of them to-day turn out finished mechanics or artisans, or, rather, mechanics or artisans finished in any particular calling or trade.

The necessity for thorough instruction in one important industry has been long recognized, but, as a national work, Germany, in her mono-technical schools, is the only country that has fairly and systematically taken it up.

There is a good sample of such a school in Philadelphia in the Textile Fabric School, an institution equipped with apparatus and machinery and supplied with an able teachers' staff, where wool, cotton and silk are taken in the raw state and go through all the processes needed in the art to the article finished for the market.

But although finished mechanics and artisans are not turned out from existing trade schools, they have a start for a profitable vocation which they can pursue and conquer, and rarely with such a start the taste fails to be developed.

Col. Auchmuty believed that if a young man was once given the taste of a mechanical trade it would act on him like the taste for music on some minds, and once get the mind open to receive instruction the rest was plain sailing, and he employed the most practical methods to bring about the results. Mortar was mixed and brick walls were laid up under the direction of a man who knew how to do it, and the knowledge was soon imparted and gradually the student was carried into intricate brickwork, plain and skew arches, groins and so forth, and to the surprise of the student he came out in five and a half months able to do a fair job, able to do well what he had been taught, and with knowledge enough to go

ahead and perfect himself in actual outdoor work.

The building trades are the great mechanical industries in demand everywhere and these are the trades mostly taught in such a school as Auchmuty's, where the methods are radical indeed, but indicate what can be done when you swing the pendulum of experiment the other way; it will swing back again by itself and a mean is soon found.

Col. Auchmuty has been a true benefactor and fearless experimenter; he broke away from the trammels of the old schools and proved to the world that a few months of actual active concentrated work in any trade, taught as he proposed, would save a youth the years of drudgery, waste time, abuse and degradation inherent in the old apprenticeship system.

Anything that can be done to better the condition of the youths of San Francisco, to give them an opportunity to make an honest living, to remove them from the influence of infamous surroundings and of neglectful parents, should be done.

A. S. HALLIDIE.

Concentrates.

COREA's gold export for '97 was \$2,034,079.

AMERICAN miners on the Yukon want a U. S. assay office at Circle City.

QUICKSILVER is reported discovered on the San Joaquin ranch, Orange Co., Cal.

THE platinum production of New South Wales for '97 was 2900 ozs., valued at \$19,575.

THE Parrot Silver & Copper M. & S. Co. of Butte, Mont., has increased its capital stock from \$1,800,000 to \$2,500,000.

THE Oregon Gold Extraction Co. of Portland proposes building a custom reduction and cyanide plant at Baker City, Or.

THE \$2,000,000 for the purchase of the Center Star mine, Rossland, B. C., was paid the Butte, Mont., sellers last week.

THE Glasgow & Western M. Co. will put in a 100-ton concentrator at Six-mile Springs, Cherry Creek, Nevada, by Oct. 1st.

LIKE other mining swindles the Electrolytic Marine Salts Co. was of Eastern origin, and it was Eastern people who were bitten.

THE total equalized assessment of Montana for 1898 is \$133,654,907—a net gain of \$2,897,496 as compared with the assessment of 1897.

IN the Ruby mine, in Jefferson county, Mont., J. Kuffman and H. Andrews, working on the 150 level, were killed last week by a cave-in.

A SENSATION is reported from Australia in the discovery, near Lake Winne, of a gold nugget weighing 115 pounds and valued at over \$30,000.

FROM the Klondike come stories of miners overcome at the bottom of their shallow shafts by smoke and gas from the fire put there to thaw out the gold-bearing gravel.

IT is calculated that during the first half of '98 25,000,000 pounds Mexican copper were imported into the U. S., and of this, 1000 tons per month re-exported to Europe.

IN a double-hand drilling contest at Placerville, Cal., Sept. 9th, G. H. Daniels made 29½ inches in fifteen minutes. In a single-hand drilling, J. Anderson made 16½ inches.

WITH the close of the war came renewed reports of Klondike richness. 'Tis, however, too late in the season for the transportation companies to lure many more victims.

RECENT sinking at the Nigel Deep gold mine, Johannesburg, South Africa, exhibits a good record. During July an incline shaft 14x7 feet was sunk from 946 feet to a depth of 1206 feet.

IT is reported that the diamond drills in the Never Sweat mine in Butte, Montana, have penetrated ore bodies at a depth of 5000 feet and that the shaft is being pushed to that level.

WHERE there has been a bona fide controversy and a compromise thereof, such settlement, in the absence of fraud or mistake, is as binding upon the parties thereto, as an original contract.

THE flourishing mining town of Jerome, Ariz., was almost totally destroyed by fire last Sunday, involving a loss of over \$1,000,000 and the terrible death of twenty people. There was little or no insurance and 1500 people were rendered homeless. The large plant of the United Verde Copper Co. escaped destruction.

A COPY is received of the official proceedings of the second session of the International Mining Congress at Salt Lake City, Utah, last July. By special arrangement, all the technical papers read there appeared in the MINING AND SCIENTIFIC PRESS, and have since been given further publicity by many of our contemporaries. A copy of the proceedings may be had by addressing Secretary W. D. Johnson, Salt Lake City, enclosing 5 cents for postage.

SUPT. ROSS of the Con. Cal. & Va., Comstock, mine, on the 14th inst., submitted the report and recommendations of the committee of Comstock superintendents, which was recently arranged for, regarding the practical determination of the question of resumption of deep mining on the Comstock. The report recommends that the mines be cleared, and that work on the lower levels be resumed, on the lines suggested in the MINING AND SCIENTIFIC PRESS of Feb. 5th, '98. It appears in full on page 287 of this issue.

FROM the 24th to the 31st ult. inquiries were sent to about three-fourths of the superintendents and managers of California enterprises depending wholly or in part on water, for maintenance, inquiring as to general conditions, betterments, etc. The replies are all in, and would fill this entire issue. Briefly, it may be said that nearly all the answers show a unanimity of sentiment and statement, the prevailing idea being that the serious loss and costly experience of '98 will prove of ultimate benefit in readjustment, repairs, and precaution so far as possible against recurrence of the present untoward condition. The low water stage, the worst, seems to have been reached, and most of the operating concerns say they have from one-fourth to one-third their usual capacity. In many instances increased water storage has been provided. As compared with previous dry years, the statement is generally made that '98 has been the driest year since 1864, a few asserting that not since 1822 has there been in California so dry a year as the present one.

The Occurrence of Platinum in the Oural Mountains.

NUMBER II.—CONCLUDED.

Written for the MINING AND SCIENTIFIC PRESS by
R. HELMHACKER, Prague, Bohemia.

In Russia, which now supplies the world with this metal, as most of it comes from the Oural, the platinum was first discovered in the year 1819 in the smelting works estate of Verkh-Tssetsk, then in 1824 with accessory gold in the estate of Nijni-Toorinsk, and at last the richest deposits in 1825 in the smelting works estate of Nijni-Taguisk. The deposits in this estate were worked without delay by Prince Demidov, and most extensively in the Veessim and Martian valleys, affluents to the Ootka, and this to the Chusovaja, and in the Chaoush valley. The deposit discovered on the Is river (a tributary to the Toora), in the estate of Nijni-Toorinsk, were developed since 1870, and they are contributing much to the general output, as in the other placers the Pt is only an inconsiderable attender of the alluvial gold.

Since the newly discovered metal was worked in the Oural, from 1824 to 1895 inclusive, 127,926 kg., or nearly 128 tons, were registered as the total production.

The price of platinum was fixed in the beginning by the Russian Government at 5½ times the value of silver (the proportion of silver to gold was fixed at 1 to 15½): 1 kg. platinum \$225.10.

As there was in the beginning a limited demand, it was made into coin by the Russians. It was used for coinage of 3-rouble, 6-rouble and 12-rouble pieces (3 roubles equal to \$2.316, 6 to \$4.62, and 12 to \$9.26), from which were struck 1,373,691, 14,347 and 3474 coins, affording a total of 4,251,843 roubles, equal to \$3,282,423. The Russian Government used for a while, from 1828 to 1838 and from 1841 to 1845, when the coinage was discontinued, to strike platinum coins of which one 3-rouble coin weighed 10.35332 grams; also, in sixteen years, to the total weight of 14,673.56 kg., or nearly 14½ tons; but soon came to give up the practice, on account of the numerous and sometimes immense fluctuations in the commercial value of the metal, ranging from shorter than four to eight times that of the silver.

The price has ranged higher during the past fifteen to eighteen years and is very high at present, as already indicated, in consequence of the constantly increasing demand for utensils. Since the coinage of the metal was given up the consumption has reached an increased aggregate; in consequence of its power of resisting the action of simple acids, its infusibility in the common furnace heat and its uncorrodibility by oxidizing processes, though its appearance is not inviting as a precious metal for jewelry. The only corrodors of it, however, are alkalis or alkaline earths, if heated with them; but it may be easily alloyed with most of the metals, the alloys being in general much more fusible than pure Pt; hence care must be taken not to heat the oxides of metals of easy reduction, as lead, bismuth, arsenic, antimony, etc., in platinum crucibles, as if any reduction took place the crucible would be destroyed by the fusion of the resulting alloy.

Platinum has long been used in the form of crucibles in the analytical laboratory, for without them, which share the infusibility of porcelain with the chemical inertness of gold ores, the composition of most minerals could not have been ascertained, and chemistry generally could not have come up to its present level. In consequence of this, it is of great service in experimental and manufacturing chemical processes, for philosophical apparatus consuming almost all of the platinum produced nowadays. But a large portion is made up into electrical apparatus, as foil and wire, while spatulas, evaporating dishes, capsules, crucibles, forceps, etc., are employed in every laboratory. But in the great industrial chemical manufacture it is used frequently for the construction of platinum stills—which have been made capable of producing eight tons daily—for the concentration of sulphuric acid, weighing sometimes as much as 30 and even 60 kg., which, although a single one costs a fortune, are cheaper in the long run than the former glass retorts.

All the production of the Oural is bought for years in the future by contracts at the present very high prices, and has to pass through the hands of the London manufacturers, Johnson, Matthey & Co. The production of platinum utensils now employed in the arts and chemistry on a large scale is in the hands of a very few firms, of which that of Messrs. Johnson, Matthey & Co. in London is generally understood to be the most important, as it is believed that of the total annual consumption of about seven and one-half tons three-fourths passes through the hands of the London manufacturers. In Paris, France, the firm of Deville & Debray is working, while Heraeus is established in Hanau, Hesse, Germany and, last, the chemical manufactory of Teutelevo, and the chemical laboratory of Kolbe & Laugsdorfs in Petersburg itself, which both manufacture only 50 to 60 kg. of metal per year. All these establishments extract and refine the platinum from the native metal, which process requires notice.

The native platinum is not the metal-pure ore, but

an alloy of Pt, and never to a greater extent than 86.5%, with Pd, Rh, Tr, Ru, Os, or polyxene metals from 3 to 7%, and with Au, Fe, Cu and sometimes gangue 1 to 3%. The even-named polyxene metals are united with a family—what is known as the platinum group—by a striking similarity in chemical characters and by their association in natural occurrence.

The analyses of samples of native platinum from the Oural, communicated by Berzelius, Osann, Deville & Debray, show the several components, which range approximately as follows:

| | |
|--------------------|----------------|
| Pt..... | 73.58 to 86.50 |
| Fe..... | 8.32 to 12.90 |
| Tr..... | .06 to 4.97 |
| Cu..... | .45 to 5.20 |
| Rh..... | .30 to 4.44 |
| TrOs..... | .11 to 2.35 |
| Os..... | 1.08 to 2.40 |
| Pd..... | .28 to 1.40 |

The native platinum is tested on its yield of pure platinum by the method suggested by Deville & Debray, as follows: Silver at the rate of 7 to 8 grs. and native platinum 2 grs. are fused with borax and charcoal. The weighed cold button gives the weight of pure Pt and Ag, less the several components which separated themselves from the two resisting metals, which remained unattacked.

The platinum is extracted from the native metal by the wet or dry method. The first process, often described, is the invention of Wollaston and published, though patented, in the year 1828, has been universally employed, and the leading steps are as follows: After the removal of some metals associated with the ore, and soluble by the successive action of the nitric and hydrochloric acids, the platinum itself is dissolved in hot aqua-regia, leaving unaffected the iridosmine. From the solution it is precipitated by a solution of ammonium-chloride in the form of a double salt, the chloroplatinate of ammonium— $(\text{NH}_4)_2 \text{Pt}_2 \text{Cl}_6$. The washed yellow salt (precipitate) is heated to redness, by which treatment the metal is left as a spongy, soft mass—the spongy platinum—when the chlorine and ammonium are expelled. The spongy metal, finely powdered under water, is next shaped by great pressure and then exposed to intense heat in a wind furnace, which cannot fuse it into a compact mass. But, possessing the property of welding, the ingot can be formed by hot and repeated hammering upon its two ends into a homogeneous and ductile mass. By this process improved upon, it is said, by an electrical treatment held secret, Heraeus produces a platinum with only 1% of other reguline components. The firms refining platinum have modified the process of Wollaston and hold secretly their manner of platinum parting.

The dry method was introduced by Deville & Debray in 1860, in forming a fusible alloy of platinum with lead by exposing the native metal with equal weight of galena (PbS) and litharge (PbO) gradually added, and some glass to act as a flux, heating to full redness in a clay-lined reverberatory furnace. The sulphur of the PbS is oxidized to SO_2 and expelled, and the liquid alloy of Pb and Pt is allowed to rest for some time, to allow the iridosmine, not being alloyed by the lead, to sink to the bottom. The upper portions of the alloy are then decanted, or cautiously taken out with ladles and submitted to cupellation, after which the crude cupelled platinum button is melted and refined in a lime furnace by means of the oxihydrogenous blowpipe. This process is also patented.

The platinum alloy with Tr or Rh, or both at once, is harder and withstands a higher heat than pure Pt and for that reason is better adapted for making crucibles. A percentage of 1 to 2 of Tr renders the metal very resistible for the highest heat. Alloys with 47% Tr and 57% Rh can be drawn into wire of high resistance.

The native platinum is associated with some other metals or alloys, or, rather, combinations, from the platinum group, which may be shortly mentioned.

The native iridium is very rare in the Keeshtim estate, Zlatoust district, as well as the native palladium, found in fine, flat scales.

The alloys of Tr and Os, in different proportions, have been named, depending on these proportions as nevianskite (the grayish white) and sissertskite (the tin white) named from Oural localities. The first, or osmiumirid Tr As_4 , is hard, and contains when pure less than 30% Tr; the chemical formula requires Tr = 19.9, Os = 80.1; but, as both metals are isomorphous and yet combined with other metals of the platinum group, its chemical composition is changing, and, according to Berzelius, 24.8 — 25 = Tr; 75.2 — 75 = Os. The second, or iridosmine Tr Os, is hard and should be Tr = 70 — 75, Os = 18 — 20; but its composition is very changeable in the Russian specimens. According to Berzelius, Claus, Deville & Debray, either:

| | |
|------------------|------------------|
| Tr 43.28 — 55.24 | Tr 64.50 — 77.2 |
| Os 49.34 — 27.32 | Os 15.38 — 23.01 |
| Pt 10.08 — .14 | Pt .41 — 2.80 |
| Rh 1.50 — 5.73 | Rh .50 — 7.50 |
| Ru O — 8.49 | Ru trace — .20 |
| Cu trace — .78 | Cu trace — .90 |
| Te trace — .99 | Te O — 1.40 |
| Pd traces. | and some Pd. |

Some newer analyses show that this alloy is on the

Oural sometimes combined even with 33% of Pt, being thus not as hard as the California specimen, which is, on account of its extreme hardness, used to make nibs, or points of gold writing pens, or axle wire, or pillows to watches.

Though the platinum and the associated metals occur in quantities of economical importance exclusively in the Oural mountains, they are in a very slight amount widely distributed in Siberia; and for that account, as there is little or nothing known in science about this occurrence, a short treatise about this matter shall be additionally here inserted.

In the Altai mountains platinum, either alone or associated with nevianskite and sissertskite, is found in the alluvial gold deposits accompanying the placer gold in a minimum amount; from 3800 to 4000 parts of placer gold only one part of platinum and its associates can be picked out. This gives a yield of about $\frac{1}{10000}$ gram in one ton auriferous gravels operated for gold washing.

In some placers in the tributaries of the Mrasa, or Pras river, a right-hand affluent of the Tom, which unites with the Obi stream at right hand, these rare metals are recognized; thus in the exhausted placer Viktorievskii, on the Koozeneligh brook, a left-hand affluent of the Onas, or Bolshaia riechka, a left-hand tributary to the Mras-su. As in the brook valley, a dyke of serpentine is recognized, the original source of the rare Pt and iridosmine and osmirid grains may be guessed.

In the region drained by the right-hand affluent of the Mras-su, the Orton, are two very small rivulets, or, rather, gulches, emptying at right in the Orton, named the Moursinskie sources. In the high waters of the Mras-su empties the Kareechilau brook, at right. These brooks carry traces of platinum in their gold placers. The latter drains a region with uraltite (amphibole) biotite granites, with dykes of uraltite porphyries, which may be the original source of the rare metal.

In the country drained by the Mondum river (Kondoma river) emptying at the left in the Tom opposite the town of Kouzneck; the right rivulets Orush, Tarlash, the left Chooktuk, the source of the left tributary Munja, the right Munja-brook Koore; the left brooks Sherik and Kazil to the Koochoora (left in the Mondum); and the Oiry-Mondum (Malaia Kondoma), with its right brook Chulesh carry traces only of platinum, without iridosmine.

The Obi stream is formed by the two streams Katuni (left) and Bia (right); a right-hand tributary to the Bia, the Koo-oo (Lebedi) which carry in its left-hand fork, the great Koo-oochak, traces of platinum without iridosmine. The Koo-oochak is a right tributary of the Koo-oo.

As the rivers flow in a ground formed from limestone, lidite, mica slate, metamorphous slates with eruptive rock and Ouralite porphyry (metamorphosed pyroxene porphyries) and its tuffas, it is not possible to guess the primitive or original rock from which this rare metal might be derived, and it will require investigation in the future to solve this question.

The Ala-Tau mountains, being the eastern dependencies of the Altai range, form the watershed between the Obi (Tom) and Bia and the Yenisei (with its left tributary, the stream Abakan, emptying at Minusinsk) and at once the line between western and eastern Siberia. Most of the rivulets formed in this range carry traces of Pt, thus in the Balik-su, emptying at the left in the headwaters of the Tom, and its tributaries. The sources of the three rivulets, the White, Black and Great Yus, uniting with the Yus, a left tributary of the Choolim, which is a right-hand tributary of the Obi, gather from the eastern Ala-Tau summits, and are, therefore, in eastern Siberia. The rivulet Ysikiul of the Yus system carries platinum in its gold placers. Though the amount of it, compared with the gold, is very slight, the pieces of Pt are great, weighing to 1 gram, which is nowhere to be observed in other places of its occurrence in Siberia.

The poor gold placers in the valley of the Kiiskii-Shalteer, a tributary of the Kiia river, this a tributary of the Choolim, in the district of Mariinsk, government of Tomsk, also carry very small quantities of iridosmine.

In the government of Irkutsk, district of Nijne-Oodinsk, platinum was met with in gold placers worked from 1855 to 1860, now exhausted, on the rivulet Touksha, a tributary of the Birusa, having its source in the Birusa snow mountains, a range of the southern Saian mountains. The Birusa belongs to the Ona system, the Ona emptying into the stream Angara at the left, not far from the mouth of the Yenisei.

If the attention of the miners would be directed more to the associating minerals in gold placers in Siberia the platiniferous gold placers would be noticed, though it is extremely uncommon that the very slight quantities of granules of this metal, which is always a rarity—sometimes accompanying the gold—are observed, and are detected only occasionally by experienced mineralogists. The conditions under which platinum-bearing and the original rock, from which the platinum or the metals of the platinum group, rarely contained in some of the Silurian gold placers, had been liberated are not as yet determined.

Electric Transmission From Mechanicville, on the Hudson.

NUMBER 11.—CONCLUDED.

The 550-volt motors in the testing department were supplied from an engine driven multipolar

750 K. W. THREE PHASE ALTERNATOR, REVOLVING FIELD UNCOVERED.

generator of 500 K. W. capacity, while a smaller engine drove a number of exciters which allowed of independent control of the excitation of all machines in this department. The factory is

plant at the works, therefore consists, of two synchronous motors, one of 500 K. W., the other of 100 K. W. and three 400 K. W. rotary converters—the synchronous motors for the testing department, the

EXCITERS AND SWITCHBOARD.

converters to supply current to the factory motors. The large engine driving the 500 K. W. multipolar generator is superseded by the 500 K. W. synchronous motor. This is a 12-pole, 400 revolution machine of the revolving field type, wound directly for 10,000 volts. The small engine driving the exciters is replaced by the 100 K. W. synchronous motor—an 8-pole 600 revolutions per minute revolving field machine similarly wound. The three rotaries supplying 250 volt current to

mand exceeds the supply from the synchronous motor driven machine, they may be connected to give 500 volt current, operating in parallel with the railway generator driven by the synchronous motor in the testing department. The rotaries are operated in parallel and all the factory motors, the factory railway and all the factory lighting are operated from the same direct current circuit.

The officers of the Hudson River Power Transmission Co. are Edmund Hayes of Buffalo, N. Y., president; R. N. King, president of the Stillwell-Bierce & Smith-Vaile Co. of Dayton, O., vice-president; G. H. Furman of Newark, N. J., treasurer; R. J. Richards of Boston, Mass., superintendent; J. S. O'Shea, manager.

A Possible Occurrence.

TO THE EDITOR:—Will you kindly answer the following questions in regard to mineral rights? Prospector "A" discovers a quartz ledge on a very steep slope of a mountain and files his claim thereon in the usual manner. A very large slide off this ledge had occurred, through which the discovery was made. The quartz in this portion of the ledge, amounting to many hundred tons, rolled to the foot of the slope, partly within and partly without the side line of the claim. Prospector "B" finds this large boulder and files his claim upon it.

Question 1—Can Prospector "A" claim the portion of this float which is lying within his side line? Question 2—Can he claim the rest of the float which is rolled outside of his side line?

PROSPECTOR.

While hesitating to attempt giving exact legal interpretation to this unusual statement of alleged facts, we are inclined to favor the claims of Prospector "A" in both instances. Regarding the boulder rolled from a located ledge, it may be considered as having been mined by nature instead of by man, and rolling upon another's ground, this irrespective of whether it weighs 1000 ounces or 1000 tons. If a piece of ore the former size fell from a wagon in transit, the owner could unquestionably pick it up and put it in the wagon again and there would be no one to dispute his act declaring ownership.

It is believed Prospector "A" can claim not only the portion of the float which is lying within his side lines, but the entire boulder and all the rest of the "slide."

The answer to Question 2 is given in the answer to Question 1. Prospector "B" seems to have no standing whatever, as he cannot locate a claim upon a boulder nor upon any ore not "in place." One of the cardinal principles of a valid location demands that the vein or fissure be "in place." Whatever rights in equity Prospector "A" may possess, Prospector "B" does not seem to have any at all.

A NOVEL method of measuring high temperature, capable of accuracy within one degree in measurements, up to the melting point of gold, depends upon the fact that the refractive index of a gas takes the same value when the density is reduced by diminution of pressure as when it is reduced by rise of temperature. A beam of light is divided, one-half passing through a tube of air in which the pressure can be varied and measured, the other half traversing a tube of air which can be heated electrically by a coil of wire surrounding the tube. The two portions of light are then recombined, so as to give interference fringes. The pressure of gas in one tube is varied so as to counterbalance any motion of the interference bands due to rise of temperature in the other, and the rise of temperature is then calculated from the variation of pressure.

A COAL MINE in Scotland which caught fire over fifty years ago, and has been burning ever since, has at last burned itself out. The mine is on the Dalquharran estate, Dailly. It was set on fire by the engine working the fans; and although many costly attempts have been made to extinguish it, they have been unsuccessful. The flames have, from time to time, burst forth from the ground in volcanic fashion. The fire was prevented from spreading beyond the one area by reason of the "dykes" of rock which intersected it.

INTERIOR OF POWER HOUSE—DYNAMO ROOM.

operated by a number of 250-volt motors running on the same circuit as the factory lights. These motors are not changed and the steam plant which supplied them is retained as a reserve in case the power from Mechanicville should fail. The electric power plant superseding the present steam

the factory motors are 10-pole, 400 K. W., 480 revolutions per minute machines, receiving the three-phase current from the air blast transformers. When connected in multiple they furnish current at 250 volts, but as they may be called upon to furnish current to the testing department in case the de-

of temperature. The two portions of light are then recombined, so as to give interference fringes. The pressure of gas in one tube is varied so as to counterbalance any motion of the interference bands due to rise of temperature in the other, and the rise of temperature is then calculated from the variation of pressure.

Is Darwinism True?

NUMBER IV.

W. S. PROSSER.

Bulwarks of evolution are "vestigial remains" and "embryonic recapitulations." In the higher animals are found certain parts, temporary or permanent, which are often useless and seem only "remains" of parts in older forms, as the vermiform appendix and others. No explanation has seemed possible except that they were such vestiges, inherited through an imperfection in the evolutionary process, which eliminated some obsolete parts but left others. Embryology is made to give similar testimony: that derivation by natural means is implied, because the embryos of higher animals go through stages of which the earlier slightly resemble the embryos of lower forms of life.

It seems to be taken for granted that something is explained by calling these "remains of older forms," as though it were a very simple thing for them to "remain." Quite the contrary. If superseded by a different device the cause of the change can only be sought in the power that introduced that new device. If we say the old parts were gotten rid of by atrophy, it has not been explained how or why they were or could be atrophied. Exactly the same explanation would make clear the origin of the new parts. The farmer discards his scythe and hangs it in a tree because he has found a better tool—the mower. The evolution of the mower from the scythe is not a physical, but a mental, process. So also of the animate inventions.

But Darwinism has been compelled to go a step further and claim not only the atrophy of superseded devices, which in certain cases actually happens, but the atrophy of useful parts by natural selection—natural means. The horse and his forebears form the best proofs that evolutionists have ever brought forward. At the beginning of the tertiary, millions of years ago, the eohippus—the size of a fox—had four toes and remains of a fifth on front feet and three behind; thence by several steps to the present horse, gaining size and losing toes at each, and, curiously, for every toe lost a molar tooth was gained.

If atrophy be alleged to account for the loss of toes, how is explained the gain in teeth? Simply that more teeth were needed by the larger animals, which is the exact reason. But Darwinists are barred from this simple and obvious explanation: that the inventor of each animal provided it in advance with all necessary teeth, and have recourse to obscure and impossible schemes of "environment," etc. Consider: for any of this horse line to have grown larger involves more food and digestion thereof. After this he grew larger and after that got more teeth, which therefore were not necessary as he had grown without them—that is, the smaller animal did not have more teeth, but the larger; yet, by the theory, they grew because they were necessary. Secondly, the theory supposes that more teeth grew either from the wish of the animal—a palpable absurdity, for animals have no such abstract wishes as far as known (the human race has wished for better teeth for centuries, yet they grow worse continually)—or from "environment," "external conditions," as, for instance, the food rubbed on the gums, the tongue and the roof of the mouth, but had not the slightest effect anywhere to make new teeth except just back of the other teeth, and here new teeth were created with all their intricate parts by—what? We are left to guess.

Did the first foot that walked on the earth have one toe or five? If five, it is a queer evolution that begins with a complex form and works to a simple. If one, it is equally queer, for it must have worked from one to five and then back again to one—the present horse. In fact, the original foot seems to have had five toes—a very complex arrangement—and one that cannot, fairly and candidly, be reconciled with the supposed development of high and complex animals from low and simple ones.

There is no proof of, and no plausibility in, the idea that one toe descended from two or three toes by atrophy or disuse. If it did, the process must be either special or general. If general, we ought to see everywhere stages of such process—cats and dogs with four, three, two toes; cattle with three or one; sheep, squirrels, birds and even men in the various stages, some with more, some less toes, or with dangling remnants of those atrophies. Going back ten or fifty thousand years, all ought to have more toes. Why is nothing of the kind found? Simply because nothing of the kind is going on. As a natural process, Darwinism is wholly imaginary. If it be claimed that the horse lost toes down to one and the ox down to two, from special causes, such must be produced and proved before they merit attention. If it be claimed that the horse ceased to use two of his three toes, proof is required first of the possibility and second of the fact of such disuse, both of which I deny. Animals, in a state of nature, use their several organs and parts in the same way century after century. If the middle of the foot bears most of the weight and the side toes act partly as buttresses, that does not atrophy them. If it did, all animals would be one-toed. The tails of many animals and the front feet of kangaroos have

no very heavy exercise, yet have not dropped off. Domestic cats have long tails, wild cats short, catamounts intermediate. No theory of "exercise" can account for the difference. The horse and elephant are both annoyed by flies, yet one has a long tail and one a short, while foxes and other furry animals need no fly brush, yet have large tails. If the horse really lost four toes out of five because they were not used as much as the middle toe (and that is the Darwinian case), then all these little used tails, the kangaroo's forefeet and the small toes of men, as well as the human ears and nose and other parts not actively used, ought to have atrophied and ceased to exist. The whole thing is absurd. There is no such process going on in nature, and there never was. All species keep steadily to their average and retain the full use of their various parts as from time immemorial. When, in the course of changes in the earth, conditions so change as to demand new devices to meet them, such can be invented and introduced only by the same power that originated the superseded parts.

(To be Continued.)

Mineral and Agricultural Patents.

TO THE EDITOR:—Articles have appeared in various issues of the MINING AND SCIENTIFIC PRESS during the past few years on the injustice done to the mining world through the classification of land as agricultural that might be, or may thereafter be, proven to be valuable for its mineral contents.

It is claimed that land worth \$2.50 to \$50 per acre agriculturally might be worth millions per acre if mined, and that it is for the greater good that the land owner give way to the miner.

Now, is it not possible that an injustice might be done to the mine owners also by any change in the present law?

Suppose a case, for instance: A mining man finds favorable indications for a mine on agricultural land. The owner objects to having his land torn up by prospectors. Without raising a howl, he quietly buys the land as a farm or ranch, and spends many thousands of dollars in developing a mine. We will say that from lack of funds he closes down the mine before it has been put upon a paying basis. If it were mineral land he would apply for and obtain a patent on his claim, and let it lie until he was able to resume work. A few hundred dollars makes his title perfect. Now, the miner working on land agriculturally patented cannot do this. He must rely on his existing title being perfect. He cannot ask the United States government to upset the title it has given, that he may repent as a mineral location. There is seldom a piece of agricultural land but that the owner is generally only too willing to sell at a reasonable figure.

Let the kickers buy, or interest capital to buy, land they think worthy of investigation for its mineral contents.

Would not the only really just way be for the Government to reclassify all lands through inspection by competent men, buy all lands then reclassified as mineral before known as agricultural, giving owners of mines on such lands ample time to protect themselves, and then throw the land open for location as mineral?

I venture to say that if the inspectors were dishonest Uncle Sam would have more mineral (?) land thrust upon him than would patch hides a mile.

Sept. 9th, '98.

READER.

The above was referred to one of the best mining lawyers in this west half of America, who comments thus:

"The writer is evidently of the opinion that when mineral is discovered in land already patented in good faith as agricultural land, the title of the owner to the mineral so discovered is rendered insecure by such discovery. Such is not the case.

"I know of no better way to state the general propositions of law touching this matter than by quoting from a decision of the U. S. Circuit Court of Appeals for the 8th circuit, rendered March 22, 1897. In that decision the following language occurs:

"If this action of the land department resulted from fraud, mistake or erroneous views of the law, a court of equity might set aside the patent, or declare it to be held in trust for him who had a better right to it. *Bogan v. Mortgage Co.*, 27 U. S. App. 346, 11 C. C. A. 128, and 63 Fed. 192; *U. S. v. Winona & St. P. R. Co.*, 32 U. S. App. 272, 15 C. C. A. 96, 107, and 67 Fed. 948, and cases cited. But in this action at law it is, like the judgments of other special tribunals vested with judicial power, impervious to collateral attack. In the case of *Steel v. Refining Co.*, 106 U. S. 447, 451, 1 Sup. Ct. 389, which was an action of ejectment in which the plaintiff's title depended on a patent issued upon a claim for mineral lands within the limits of a townsite, and the defense was that the patent was void because the land was not mineral, and the patentee was not a citizen, and had not declared his intention to become such, the Supreme Court held that proof of these facts was inadmissible to attack the patent, and declared that the land department necessarily 'must consider and pass upon the qualifications of the applicant, the acts he has performed to secure the title, the nature of the land, and whether it is of the class that is

open to sale. Its judgment in these matters is that of a special tribunal, and is unassailable, except by direct proceedings for its annulment or limitation.' To the same effect are *Heath v. Wallace*, 138 U. S. 573, 575, 11 Sup. Ct. 330; *Barden v. Railroad Co.*, 154 U. S. 288, 14 Sup. Ct. 1030; and *Davis' Adm'r v. Weibbold*, 139 U. S. 507, 524, 11 Sup. Ct. 628. In *French v. Fyan*, 93 U. S. 169, 172, the Supreme Court held that parol evidence was inadmissible to show that land patented to the State of Missouri as swamp and overflowed land was not in fact swamp or overflowed land, and on that account the patent was void. In *Ehrhardt v. Hogaboom*, 115 U. S. 67, 69, 5 Sup. Ct. 1157, that court held, on the other hand, that parol evidence was inadmissible to show that land patented to a pre-emptor was swamp or overflowed land, and was therefore included in the grant to the State of California, and that the patent to the pre-emptor was void on that account. A patent to land or mineral lodes, over which the land department of the United States has the power of disposition, and the jurisdiction to determine the claims of applicants for, under the Acts of Congress, is impregnable to collateral attack, whether the decision of the department on which it is based was right or wrong, and the patent conveys the legal title to the property to the patentee. *U. S. v. Winona & St. P. R. Co.*, supra; *Minter v. Crommelin*, 18 How. 87, 89; *U. S. v. Schurz*, 102 U. S. 378, 401; *French v. Fyan*, 93 U. S. 169, 172; *Quinby v. Conlan*, 104 U. S. 420; *Smelting Co. v. Kemp*, 104 U. S. 636, 645-647; *Steel v. Refining Co.*, 106 U. S. 447, 450, 452, 1 Sup. Ct. 389; *Heath v. Wallace*, 138 U. S. 573, 585, 11 Sup. Ct. 380; *Knight v. Association*, 142 U. S. 161, 212, 12 Sup. Ct. 253; *Noble v. Railroad Co.*, 147 U. S. 174, 13 Sup. Ct. 271; *Barden v. Railroad Co.*, 154 U. S. 288, 14 Sup. Ct. 1030. If a more careful analysis of the authorities upon and a more exhaustive consideration of these questions are sought, they will be found in *U. S. v. Winona & St. P. R. Co.*, 32 U. S. App. 272, 15 C. C. A. 96, and 67 Fed. 948, which was decided by this court in 1895."

A Rich Gold Country.

If a pin be placed at Denver, Colo., on the map, and another at Stockton, Cal., and a string be drawn from one to the other, an air line will be marked, passing through the heart of a wonderful gold territory. Slightly to the north of Denver is Central City, and southwest of that city is Cripple Creek; about thirty miles to the north of the string Leadville will be found; in the southwest corner of Colorado will appear Telluride, Rico and other points where gold is mined; Marysville in Utah, almost due south of Salt Lake City, will appear to the south of the string; fifty miles to the north of it, near the line between Utah and Nevada, will appear Osceola; Deep creek lies north of Osceola and on the southern edge of the great desert west of Salt Lake City; Detroit and several other rich gold camps are almost due east of Osceola; Pioche lies 100 miles south of the string; and the wonderfully rich gold territory of the Monkey Wrench district lies southwest of Pioche.

Now, north and south of the string will appear dotted on the map of Nevada the gold camps of Grant, Freiburg, Reveille, Wawich valley, San Antonio, Gold Peak, Hot Springs, Belleville, Candelaria and numerous others. Almost under the string, in California, we find Bodie, and to the north of it Markleeville and other points—all on the eastern slope of the Sierra Nevada mountains. On the western slope of the great Sierras the string will be almost on the Utica mine, which is located between San Andreas and Sonora. North and south of the Utica mine are hundreds of rich gold mines in profitable operation.

The distance from Denver to Stockton is about 1200 miles. On no portion of the habitable globe is there a region so continuously and enormously rich in gold as the territory described; and yet, notwithstanding this fact, the progressive Yankee has scarcely made a start in opening and developing these riches which have been entombed for millions of years, and which will remain so sepulchered until we awaken to an appreciation of the fact that the States of Colorado, Utah, Nevada and California bear within their bosoms more wealth than was ever dreamed of by Croesus.—J. A. Latcha in September Forum.

AS ILLUSTRATING the triumphs of modern science in the construction of instruments of precision the *Scientific American* instances a chronograph for recording infinitesimal intervals of time, such as a millionth of a second or less, which is stated to have been used to record autographically the compression by a blow of a cylindrical piece of copper. In one case a thirty-three-pound weight fell 15 inches and produced a permanent compression of .1658 inch in a copper cylinder, the time consumed in producing this compression being .0030317 of a second. The machine produces by means of photography a curve showing the precise progress of this compression. The chronograph which reaches such remarkable results consists of a rotating cylinder, with a surface velocity of 100 feet a second, on which is photographed a pencil of light, which is passed through a hole in the end of a rapidly vibrating tuning fork.

Coast Industrial Notes.

—A refinery at Vancouver, B. C., is importing raw sugar from Java.

—Competition has resulted in a \$25 and \$15 rate from Seattle, Wash., to Skaguay.

—The Santa Fe Co. now employs at its Albuquerque, N. M., shops over 600 men.

—The Lacy Co. of Los Angeles, Cal., have built a 36,700-gallon oil tank at San Bernardino, Cal., of steel plates.

—The Gila Valley, Globe & Northern Railroad from Bowie to Globe, Arizona, 125 miles, will be completed Oct. 1st.

—About 30,000 tons of sugar beets have been produced this season in the Grande Ronde valley district, Oregon.

—Victoria Island, containing 8000 acres, sixteen miles from Stockton, Cal., has been sold for \$320,000 to London purchasers.

—The Northwest reports that business with the big cargo lumber mills on the sound is better, foreign and coast orders coming in.

—From Baker City, Oregon, were shipped last Tuesday 23,000 sheep for Chicago. This is the final shipment this season of 73,000 head.

—Failure is reported to have attended the Government effort to discover an entrance for deep sea vessels at the mouth of the Yukon River.

—At La Grande, Or., farmers are paid \$4 a ton for beets containing 14 per cent saccharine and 25 cents for every additional per cent of sugar.

—The California Powder Works of San Francisco has a contract from the Government for 500,000 pounds of smokeless powder at 90 cents per pound.

—The San Francisco Mechanics' Institute has decided to hold an exposition in '99. The institute has held an annual fair for thirty years, but passed this year.

—A disastrous fire last Sunday destroyed the town of New Westminster, B. C., entailing a loss of nearly \$2,500,000. There is considerable resultant destitution.

—The California Oil and Gas Co. of Arizona has incorporated at Yuma, with a branch office at San Francisco. The capital stock is \$2,000,000, with shares \$10 each.

—A cable from San Francisco to the Hawaiian territory of the United States will be a commercial necessity. The estimated cost is \$1065 per mile, in round numbers \$2,500,000.

—The approximate earnings of the Mexican Central Railway for the fourth week of August aggregated \$352,950, against \$313,983 for the same period of 1897, an increase of \$38,967.

—The California Limited over the Santa Fe route will begin running on November 2nd between Los Angeles and Chicago, the fastest train scheduled between California and Chicago.

—Z. L. Tanner, U. S. N., has awarded the contract for building piers and coaling sheds at Pago Pago harbor, Samoa, to Healy & Tibbitts of San Francisco for \$142,900. The work will be finished by Jan. 1, 1900.

—The annual report of the Southern Pacific Co. for the twelve months ending June 30th shows an increase. The gross earnings for the year were \$55,780,337. The net earnings, after deducting the operating expenses, were \$1,160,611.

—Of commercial importance to the Pacific coast is Luzon, the largest of the Philippines, equal in area to Cuba and Porto Rico combined, nearest the Chinese coast. On it is the city of Manila. That island should be obtained by the United States.

—The Los Angeles, Cal., Railway Co.'s system of electric street railways has been bought by Southern Pacific men. The transaction involves the issue of \$5,000,000 in bonds, \$4,000,000 to be devoted to cancelling the bond issue of the old corporation, to the liquidation of indebtedness and to improvements. The bonds of the new company are to bear 5 per cent interest. The price paid is in the neighborhood of \$4,000,000.

—The Union Iron Works of San Francisco, which has received so much deserved commendation in the high character and splendid record of the vessels built for the Government, will be given a contract for the entire production of one of the three new warships and three of the new torpedo boat destroyers, the latter will cost \$281,500 each, and will be built on designs furnished by the Union Iron Works and approved by the Government.

—Till recent years the largest body of fresh water wholly within U. S. limits was Tulare Lake, Cal. Irrigation, etc., gradually reduced its limits, and this year the lake is entirely dried up. A land district has been formed in the lake bed and it is expected that 30,000 acres of the old lake bed will be converted into tillable land. A levee is to be built thirteen miles long, costing \$7000. Wells will be bored to furnish water for irrigation. It is said that the space left by the lake's disappearance has been appropriated, so that there will be room for a stampede. The work of reclaiming will cost some money, but for this purpose share of the purchase price is available, it is claimed, the State's price of \$2.50 an acre being cut to 50 cents, which goes into the State school fund. The claimants of the tract are paid in their assessments to complete the levee.

Catalogues, Etc.

Personal.

R. S. RAW, a mine operator of Placerville, Cal., is in San Francisco.

E. GOODWIN is the new Mgr. Manufacturers' and Producers' Association.

J. J. CRAWFORD has returned to San Francisco from Placerville, Cal.

ROSS E. BROWNE has returned to San Francisco from San Andreas, Cal.

A. N. BUTTS, Supt. Bovee mine, San Andreas, Cal., is in San Francisco.

M. C. HARRINGTON has been appointed Supt. Lucky Boy mine, Custer, Idaho.

F. W. BRADLEY of San Francisco is at the Spanish mine, Washington, Cal.

D. GUTMAN, Pres. Amelia mine, Jackson, Cal., has returned to San Francisco.

M. W. MATHER, Supt. Cramer G. M. Co., Alleghany, Cal., is in San Francisco.

D. HARMON, Supt. Gaston Ridge mine, Graniteville, Cal., is in San Francisco.

CAPT. BUCKLEY, Supt. Gold Valley mine, Downieville, Cal., is in San Francisco.

ALF. TREGIDGO of San Francisco is examining mining properties in Nevada county, Cal.

W. H. MARTIN, San Francisco, has returned from a visit to the Rawhide mine, Sonora, Cal.

O. KORBEL, Pres. Texas G. M. Co., Nevada City, Cal., has returned from a visit to the mine.

T. J. HOUGHTON, Supt. Lighter mine, Angels, Cal., has returned from San Francisco.

J. M. BUFFINGTON, Supt. La Suerte mine, Nevada City, Cal., has returned from San Francisco.

F. W. PAGE, Gen. Mgr. South Fork Gravel M. Co., Forest, Cal., has returned from San Francisco.

G. STEVENS is examining mining properties near Nogales, Ariz., for the Yellow Aster Co. of Randsburg, Cal.

A. B. FRENZEL, who has been exploiting a turquoise property near Tucson, Ariz., has returned to New York City.

C. A. PREVOST, 17 Popstone Road, London, S. W., has gone on a business trip to the Argentine Confederation, S. A.

L. I. SEYMOUR succeeds Hennen Jennings as consulting engineer to the New Modderfontein G. M. Co., South Africa.

J. A. CORAM, not wholly unknown to holders of Merced, Cal., mining stock, is inspecting his properties at Cochiti, N. M.

E. SCHWARTZ has been appointed director of the Wilmering Trade School, San Francisco, Cal., at an annual salary of \$2500.

HENRY T. SCOTT, Mgr. Union Iron Works, has returned to San Francisco from a successful business trip to Washington, D. C.

J. Q. PACKARD of Salt Lake City, Utah, is visiting his Tiptop mine at Hailey, Idaho. He has decided to build a mill upon the property.

W. R. CHAPBOURNE, Mgr. Mikado mine, Leadville, Colo., has returned to San Francisco en route to the Lindsay mine, Maybert, Cal.

H. P. GORDON, formerly foreman of the North Bloomfield, Cal., now fills a similar position for the Pande Basin Co., Sitka, Alaska.

MARTIN KELLOGG has resigned the presidency of the University of California, at Berkeley, Cal., the resignation to take effect March 23, '99.

H. B. WINCHELL, Assistant State Geologist of Minnesota, has accepted the position of geologist with the Anaconda Copper M. Co. at Butte, Montana.

O. O. HOWARD JR. and C. D. RICHARDS, who have been examining the Viznaga mine near Ensenada, Lower California, have returned to San Francisco.

H. W. NEWHALL of the Curtis-Newhall Adv'tg. Co. of Los Angeles, Cal., left San Francisco on the last steamer for Honolulu, Territory of Hawaii.

F. W. WILMANS, Supt. Bonanza mine, Sonora, Cal., has returned from San Francisco. His company is building a mill and expects to operate with electric power.

NELLIE CASHMAN, the famous female prospector, writes from Dawson that she has a tomato can or two filled with gold dust, but won't come out till she has a small barrel of it.

BINGER HERMANN, Commissioner General Land Office, is in San Francisco conferring with State officials on the subject of forest reservations and protection of standing timber.

S. F. EMMONS, of the U. S. Geological Survey, has been examining various copper properties on the coast, and is at Jerome, Arizona, this week. He expects to return to Washington Oct. 1st.

S. C. WILMANS, Supt. Boulder mine, Shingle Springs, Cal., is in San Francisco. He says the company, of which he is a member, is putting in steam power and will soon be able to crush ore independent of the water famine.

R. U. GOODE, geographer U. S. Geological Survey, is in San Francisco. He has been conducting a survey of the boundary line between Montana and Idaho and the boundary line between the United States and Canada in that region.

COL. CHAS. R. SUTER, Corps of Engineers, U. S. A., who for some time has been a member of the California Debris Commission, will on October 15th exchange stations with Col. Sam'l M. Mansfield of Boston, Mass., the latter officer assuming the duties hitherto discharged by Col. Suter.

J. B. REINSTEIN, of the University of California, has gone to Antwerp to attend the meeting of the international jury that is to pass upon the plans submitted in the Phebe Hearst architectural competition of the University of California. The jury will meet on

September 29th. Mrs. Hearst has provided that each of the architects who is successful in the preliminary trial shall be furnished free transportation to San Francisco and that his expenses shall be paid while in California.

E. M. HAND of Butte, Montana, sailed this week to inspect and report upon the mineral resources of the Malay archipelago and the Philippines for a London company. He says he will devote most of his time to Borneo. There is considerable placer gold in that island, and some quartz, a number of stamp mills having gone in during the last two years, but the interior is practically unknown.

Commercial Paragraphs.

CONTRACTS involving 10,000 H. P. are not common. Especially is this true when the agreement is to transmit this enormous amount of power over a distance of forty-five miles. And when the contract further stipulates that the losses in generators, transformers and line shall remain normal, notwithstanding the difficulties involved, the agreement then becomes of still greater interest. Such a contract has just been executed by the Westinghouse Electric & Manufacturing Company, in which they agree to comply with the above conditions. The plant is for the Snoqualmie Falls Electric Power Co., of Snoqualmie Falls, Washington. The power station is to be located at Snoqualmie Falls, forty-five miles from Tacoma and thirty-one miles from Seattle, to which place the current is to be transmitted and then utilized by Westinghouse motors. The contract involves the building and delivery at above points, of four three-phase, rotary armature generators, having a normal aggregate capacity of 6000 kilowatts, and which are to be direct connected to the water wheels: two 75 kilowatt kodak exciter dynamos also to be direct connected to water wheels; high and low potential switchboards, for main power station and sub-stations at Seattle and Tacoma, involving seventy-six marble panels with all necessary instruments, switches, etc.; high tension oil insulated static transformers having an aggregate capacity of 10,575 kilowatts; rotary transformers with a total output of 2700 kilowatts and six type "C" motors developing 1600 H. P. with adequate lightning protection at both ends of the line. These machines when installed will make available for industrial, railway and lighting purposes the power of Snoqualmie Falls. The line potential will be 25,000 volts, and its current will be carried over bare aluminum wires to sub-stations where lowering transformers will sufficiently reduce the voltage for safe transmission within the corporate limits of the two cities.

A MIDDLEBROOK, Denver manager Jeanesville Iron Works Co., writes that his people are building a compound mine pump to carry 500 pounds pressure for parties in Los Angeles, Cal., and that their shops are very busy on mine pump work.

Recently Declared Mining Dividends.

Grand Central, Utah, 12½ cents per share, \$31,250; Sept. 10th. Total paid in four months, \$125,000.

Elkton Con. M. & M. Co., Colorado, 2 cents a share, \$25,000; payable September 20.

Bunker Hill & Sullivan M. Co., Idaho, 7 cents per share, \$21,000; September 5.

Gold Coin M. Co., Colorado, 1 cent per share; payable September 25.

Mercur, Utah, \$25,000; payable Sept. 20.

Silver King, Utah, \$37,500; Sept. 10.

Horn Silver, Utah, \$20,000; payable Sept. 25.

Co-operative Mining Syndicate, Washington, \$1.50 per share; Sept. 17.

Portland, Colorado, 2 cents per share, \$60,000; Sept. 15.

Anchuria-Leland, Colorado, 1 cent per share, \$6000; Sept. 15.

Recent California Mining Incorporations.

Chaparral M. Co., San Francisco; capital stock \$100,000, subscribed, \$70,000; W. Christie, J. H. Middleton, F. L. Fine, F. J. Juchter, N. W. K. Schore.

Leviathan M. Co., Alpine Co., Cal.; capital stock \$1,000,000, subscribed \$60,000; P. Curtz, D. Barrie, F. E. Brooks, J. L. Brooks, H. W. Curtz, P. N. Packard.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey, Strong & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR THE WEEK ENDING SEPTEMBER 6, 1898.

610,377.—PREPARING PRUNES FOR DRYING—W. C. Anderson, San Jose, Cal.

610,378.—WAVE MOTOR—E. M. Barthel, San Jose, Cal.

610,387.—GANG PLOW—G. W. DeWitt, San Ardo, Cal.

610,436.—ROLLER BEARING—G. W. Dickenson, Tacoma, Wash.

610,393.—TELEPHONE—S. S. Fisher, S. F.

610,481.—ELEVATOR—E. M. Fraser, S. F.

610,353.—GRIP PULLEY—A. S. Hallidie, S. F.

610,181.—TYPE WRITER REGISTER—F. A. Hassler, Santa Ana, Cal.

610,354.—COMPASS JOINT—F. H. Heath, Tacoma, Wash.

610,458.—FRUIT GRADER—G. M. Peterson, Salem, Or.

610,421.—SHIP'S BERTH AND SETTEE—T. R. Turner, S. F.

610,503.—MOTOR CARRIAGE—W. E. Twitchell, St. Helena, Cal.

610,312.—STAND BOILER—F. Walker, Los Angeles, Cal.

29,319.—JEWEL CASE DESIGN—Dora M. Smith, Los Angeles, Cal.

NOTE.—Plain and Certified Copies of U. S. and Foreign patents obtained by Dewey, Strong & Co., by mail or telegraphic order. American and Foreign patents secured, and general patent business transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

APPARATUS FOR PREPARING PRUNES FOR DRYING.—Wm. C. Anderson, San Jose, Cal. No. 610,377. Dated Sept. 6, 1898. The object of this invention is to provide a continuous apparatus by the use of which fresh prune plums are first dipped in a lye solution for the purpose of removing the bloom and sterilizing any ferment, germs, etc. They are then carried to a second dipping and washing tank and from this delivered into a separator where dirt is separated from the fruit, thence to the graders or an intermediate pricking device, when the latter is used, whereby the skins are punctured, and then to the trays upon which the fruit is spread and conveyed to the fields for drying. These transfers are made successively and mechanically from one part to the other so that the amount of handling of the fruit is greatly reduced, and the number of operators and expense of the work is made much less than in the ordinary means employed for this class of work.

GRIP PULLEY.—A. S. Hallidie, San Francisco, Cal. No. 610,353. Dated Sept. 6, 1898. The object of this invention is to increase the gripping power in that class of wheels or pulleys over which grip ropes or cables pass, and it consists of devices by which elastic pressure may be applied to the gripping pulleys to prevent the rope from slipping, these devices adapting themselves to inequalities of the rope, variation in the truth of the pulley and fluctuation in the hauling strain upon the rope. These devices consist of spring-pressed pulleys or rollers between which the full-curved gripping jaws pass successively as the rope is gripped by the jaws and the rollers act to compress the jaws more closely upon the rope while it is passing around the pulley and between the jaws. These grip jaws are allowed to open for the rope to pass out as it leaves the pulley and are also sufficiently open for the rope to pass between them when it arrives at the pulley and is an improvement upon the grip pulleys previously patented by Mr. Hallidie, and it is particularly applicable for hauling ropes for logging purposes and for transmitting a large amount of power as may be needed in hauling logs long distances through timber regions for ropeway or tramway purposes.

GANG PLOW.—Geo. W. DeWitt, San Ardo, Cal. No. 610,387. Dated Sept. 6, 1898. This invention consists essentially in a mechanism whereby the draft may be applied toward the rear of the triangular frame, as well as the front end, and means by which the draft can be shifted from one side to the other of this portion of the frame so as to hold the plow up to its work and resist the tendency to slide downhill while working upon hillsides. The draft chain is connected with a ring by clevises which allow it to be adjustably attached to the front bar of the plow frame, and rods diverge rearwardly from the clevis to a transverse bar fixed across the plow frame intermediate between its front and rear ends with pulleys journaled at either side of the central line of draft and a lever connected with the chain that the draft may be transferred to one side or the other and regulated at will.

MOTOR CARRIAGE.—Walter E. Twitchell, St. Helena, Cal. No. 610,503. Dated Sept. 6, 1898. This invention is designed to produce an improved mechanism for transmitting the power of any motor such as gasoline, electric or other engine to both sets of the vehicle wheels, and to thus increase the efficiency of the driving. The vehicle body has front and rear wheels turnable upon their shafts and a countershaft journaled to the vehicle body between them. By means of a sprocket wheel upon this countershaft motion is communicated directly from the motor and through a second countershaft journaled essentially in line above the fore wheel axle and sprocket wheels and chain, motion is communicated to the front wheels, the axles of which have hinged or jointed ends and a mechanism by which they are turnable about their hinges to steer the vehicle without greatly changing the position of the driving sprockets with relation to those from which the power is received. Chains from sprocket wheels upon the main countershaft pass around sprocket wheels upon the rear driving wheels so that they are driven in unison with the front wheels. By means of suitable handle and connecting mechanism the gears may be changed to reverse the movement of the machine and the speed may also be changed by a suitable arrangement of gearing.

WAVE MOTOR.—Michael Barthel, San Jose, Cal. No. 610,378. Dated Sept. 6, 1898. The object of this invention is to provide a more perfect means for applying the vertically reciprocating movement caused by the action of the waves to produce corresponding movements in machinery. The apparatus which is built upon a wharf or structure comprises an enclosed open bottomed casing within which a float is freely movable and by which it is protected from the transverse movement of the waves and acted upon by the vertical movement only. A cross-head is slidable upon guides in line above the float with which it is connected and a drum mounted upon the journal shaft has flexible ropes coiled about its periphery, one extending upward to connect with the cross-head and others coiled in the opposite direction around the drum extending down to connect with the float so that the vertical movements of the float are transmitted to produce a rotary oscillation of the drum. By means of a second shaft and pulleys to which the power from this drum is transmitted and suitable ratchet gearing, the alternate rotations of the drum in opposite directions are converted into a continuous movement of the second drum in one direction.

Laws Governing Water Right.

TO THE EDITOR:—1. What is meant by filing on water? 2. How does it affect my interest in a stream of water? 3. How does it affect my neighbors on either side? 4. Can I file on more than one stream? 5. Where is the filing done and at what cost?

Eureka, Humboldt county, Cal.

1. "Filing on water" is probably an expression in the local vernacular, indicating one of the acts to be performed in appropriating the water of a running stream for some useful or beneficial purpose; that is, filing for record in the Recorder's office a notice of appropriation.

2 and 3. The laws of California provide that the right to use the running water in a river or stream or down a canyon or ravine may be acquired by appropriation. The courts of California construe this to mean that the running water of the stream may be taken out of it and carried elsewhere for use, provided that

(a) The land through which the stream flows below the place of intended diversion is Government land, unoccupied or unclaimed under any of the public land laws; or

(b) If claimed under such laws, the attempted appropriation must be of such quantity and for such uses and purposes as will not appreciably diminish the quantity or impair the quality of the water as it flows to the land of the lower proprietor. In other words, after lands of the public domain have passed into private ownership, or rights to such lands have been initiated under the public land laws, no subsequent appropriation of the water flowing through them can diminish or impair the rights of such prior riparian proprietor.

What is an excessive appropriation or an impairment of quality or an infringement of the right of the lower proprietor depends entirely upon the facts surrounding each particular case.

4. Subject to the qualifications above stated, a party may "file" upon as many streams as he pleases.

5. A person desiring to appropriate water must post a notice in writing in a conspicuous place at the point of intended diversion, stating therein, first, that he claims the water there flowing, to the extent of a given number of inches measured under a 4-inch pressure; second, the purposes for which he claims it, and the place of intended use; third, the means by which he intends to divert it, and the size of the flume, ditch, pipe or aqueduct in which he intends to divert it. A copy of the notice must, within ten days after it is posted, be recorded in the office of the Recorder of the county in which it is posted. So far as the expense of this is concerned, it is merely nominal.

Within sixty days after the posting of the notice, the claimant must commence the construction of his works and prosecute the same diligently to completion, unless interrupted by snows or rain. As between two appropriators, the first in time is first in right.

This is a general outline of the law of water as administered in California. It is an expert statement from a lawyer eminent in his profession, the matter being deemed of sufficient general importance to warrant extended and authoritative reply.

Rubber From Corn.

From the waste of ordinary yellow corn chemists, working in a guarded laboratory in a big sugar refinery in Chicago, produce a rubber that will bend and stretch, and which, it is claimed, has the resiliency of Para caoutchouc. Combined with Para rubber in the proportion of half and half, experts say this new rubber of corn will cheapen the cost of rubber goods 25 per cent. In the manufacture of glucose a good deal of corn has always been waste material. Some of this was made into other products, but there has always been a refuse of about 5 per cent which could not be utilized. This is what will be transformed into the new substitute for rubber. Corn rubber has almost exactly the appearance of the ordinary reddish-brown India rubber. The pro-

cess of manufacturing is not perfect enough to make it resist heat as well as India rubber, however. This has offered the greatest difficulties to the chemists, who are now working to remedy this defect. Tendency to oxidation is one of the defects of India rubber. The men who are working on the corn rubber declare that articles manufactured from it will always remain pliable and not crack.

An Odd Irish Railway.

Written for the MINING AND SCIENTIFIC PRESS by ARTHUR GORE.

The single rail railroad connecting the town of Listowel with the pleasure resort of Bally Union, situated on the southwest coast of the county Kerry, Ireland, and near the mouth of the river Shannon, is of unique construction and presents many features of interest not only to engineers, but also to those engaged in the promotion of cheap railroads in new countries. The line was built in the years 1886-87 by the Lartigue Railway Construction Co. of London on the patents of Mons. Chas. Lartigue, a French engineer, and has been in successful operation since that date. It is, so far as the writer is aware, the only one of its kind in Great Britain, the other similar lines having been built in France, Spain and Algeria. The chief traffic on the line consists mostly of passen-

and are in lengths of about 20 feet. Rollers on the engines and cars run against these side rails and prevent oscillation of the train when in motion, while the rail on top carries the entire load. The total weight of the permanent way, excluding switches, bridges, etc., is, roughly, 163,500 pounds per mile. The turntables are about 30 feet diameter, made in the same manner with rails and trestles suitably braced and revolving on a ring of live rollers in the usual way. The rail for turntables and switches is made slightly thicker in the web. The switch is an ingenious device. One of them may be seen immediately in front of the locomotive in the accompanying cut. It is made of a curved length of rail struck with a radius of 90 feet, in the same manner as the turntable and about the same diameter. The center pivot, on which the switch revolves, is not immediately beneath the center of the rail in a vertical direction, but is set at a distance from a tangent to the curve, depending on its radius, in this case about 10 inches. By means of this switch it is possible to shunt onto four or five different tracks. Each switch is provided with a signal and interlocking gear, which secures it simultaneously at both ends. The signal cannot be placed at safety until it is so secured and the key removed from the lock; and, conversely, the first

STATION ON A SINGLE RAIL RAILWAY.

gers in summer and sea sand in the winter months, large quantities of the latter material being hauled from the beach at Bally Union to Listowel, and taken from there by farmers for manuring purposes and reclaiming peat bogs. The road is about ten miles in length, single track, with a station and passing place for trains half way at the village of Leselton. It is constructed throughout of steel. The permanent base consists of a single rail mounted on trestles of a triangular shape, resembling the letter A, with an extended base to form the sleeper on which the engine and cars run. This rail is of double-headed section, about 4 inches deep by $1\frac{1}{2}$ inches wide across the head, by about $\frac{5}{16}$ inch in thickness, and weighs twenty-seven pounds per yard. Each rail is about 30 feet long. It is bolted to the trestles at the top by $\frac{1}{2}$ -inch bolts fitted with washers of a special kind to prevent the nuts slackening back. The top of the rail is 3 feet $3\frac{3}{8}$ inches above the sleeper in the ordinary line as used on level ground. The trestles are spaced at intervals of 3 feet $3\frac{3}{8}$ inches center to center, except at the rail joints, where the distance is reduced to 20 inches. They are made of angle steel $1\frac{1}{2} \times 1\frac{1}{2} \times \frac{3}{8}$ -inch section, riveted at the base to a sleeper about 3 feet 6 inches long of a channel section 6 to 7 inches wide by $\frac{3}{8}$ inch thick. At a distance down of about 2 feet from top of rail is riveted across the trestle a piece of angle steel of the same section as the uprights. Attached to this cross piece at its extremities, and running along either side of the structure, are light guide rails, formed with a web $\frac{3}{8}$ inch thick and single head 1 inch wide on face, laid on their sides. They weigh twelve pounds per yard

operation in connection with unlocking the switch places the signal at danger, and while the switch is open the signal cannot be moved from that position.

The crossings are of two kinds on this line: Where a roadway crosses the line at the level of the sleepers, a gate is formed in the line, hinged at one end, with its outer end moving on a roller path. These gates are interlocked with signals in the same manner as the switches. Where the roadway crosses at a higher level, posts are erected at either side of the line, to which are hinged at a suitable height gangways or doors, raised or lowered by means of chains and counter-weights, somewhat similar to those in use at ferryboat landings to allow for the rise and fall of the tide. The doors, when down, rest on the rail and provide a roadway for traffic to pass. These crossings are also interlocked with signals which show at danger until the doors are tight up against the vertical posts, free for the trains to pass clear. The engines are provided with two boilers of the ordinary locomotive type, connected together both in the steam and water spaces by suitable pipes; they are slung on either side of the line and suspended from cross beams attached at the centers to the frames containing the wheels and motion. They are fitted with copper fireboxes and brass tubes. The wheels are three in number, 24-inch diameter on tread, coupled by side rods. They are of steel and fitted with tires; the leading and trailing wheels have flanges on either side $\frac{1}{2}$ -inch deep, and the center wheel is made broad on the tread and without any flanges. The cylinders are 7-inch diameter by 12-inch stroke; the pressure of steam is 150 pounds per square inch. The ordi-

nary Stephenson link-motion is used for operating the valve gear. The tender is also fitted as an auxiliary motor, supplied when in use with steam from the boilers, and can be used when required with heavy loads on a steep grade.

The motor is thrown out of gear by a special form of friction clutch; the cylinders and motion is contained in frames similar to those on the engine. On either side is a water tank and coal bunker. The tender carries 200 gallons of water and one ton of coal. The weight of engine in working order is about 15,680 and tender 10,000 pounds.

The passenger cars are made to accommodate twenty in the first-class cars and thirty in the third-class cars, equally divided on either side. They weigh about 6700 pounds unloaded and from 9700 to 11,200 pounds loaded. Each car is mounted on two trucks; each truck has two wheels 22 inches in diameter; they are of the Mansell type, with wood centers and steel tires fitted with flanges. All the engines and rolling stock are fitted with the Westinghouse automatic air brake, and the engine is also provided with a hand brake. The freight cars are built to carry 9000 pounds and weigh, unloaded, from 6500 to 7000 pounds. Special ballast cars are used for the transport of sand. They are constructed of angles and thin iron plates with drop doors at the bottom. The usual weight of passenger trains hauled—six cars, exclusive of engine and tender,—is about 64,000 pounds, and the average speed twenty miles per hour. Attached to each passenger train is a dummy car, fitted with steps for crossing to either side of the train. The grades on the line vary from 1 in 40 to 1 in 150, and the sharpest curves are 90 feet radius.

It is claimed by the promoters of this system that it presents many economical features, besides favoring simplicity of construction, especially in mountainous countries or mining districts, as the single-rail permits of sharp curves, and, the rail being elevated, the inequalities of the ground surface can be met by lengthening the supports as required, and the rail level preserved without recourse to expensive earthworks. In running through countries where timber is plentiful, a large amount can be used in constructing the line. In such cases ordinary rails can be used and spiked to the timbers. Where steel is used, though, the section is of course made stronger as the length of trestle increases.

At the exhibition held last year in Brussels an experiment with one of these lines on a large scale was carried out. Three miles of track was laid down, considerably stronger than the line above described, the object being to demonstrate the adaptability of the system for rapid transit, and speeds as high as 100 to 120 miles per hour were proposed. The motive power used at Brussels was electricity, generated at a power station on the grounds and supplied to the motors at a pressure of 700 volts through a copper conductor of channel section running along the line and resting on insulators secured to the sleepers, the return circuit being made through the wheels and rail. The car was 58 feet long by 11 feet wide and was made to accommodate 100 passengers. The total weight, including all machinery, was fifty-five tons. It was mounted on two trucks having four wheels each 4 feet 6 inches diameter on tread. There were four motors, two to each truck—one on either side; two wheels of each truck were driven and two ran free. The motors were of the four-pole type and each developed 150 H. P. when running at 600 revolutions per minute and supplied with current at 700 volts. The car axles ran at the same speed. The connection between the spindle of the armature and train axle was made by means of a steel chain of special make; the armatures were 26 inches in diameter by 11 inches long. The total weight of each motor was 8288 pounds. The car was provided with pointed ends like a boat to diminish the effect of wind pressure. The weight of rail used in this case was eighty-two pounds per yard.

The accompanying illustration represents a station on the Irish line.

Mining Summary.

ALASKA.

F. C. Wade, crown attorney of the Klondike, estimates the gold output this season at \$8,000,000. A recent census shows that there are 16,000 people in Dawson and 10,000 on the rivers and creeks in the district.

A report from United States Consul McCook at Dawson City, written on August 4, says that prices of provisions are very high, exceeding by 25 per cent those of last year, and lodging is hardly to be had at any price. Outsiders, he says, cannot realize the conditions: destitution and suffering is imminent for many unfortunate prospectors, who are unable to get away. No one, he continues, should go to the gold fields without a couple of thousand dollars and supplies for two years. The output of gold has been exaggerated five fold.

ARIZONA.

A Tombstone dispatch says Smith Bros. & Moore of that place have sold to Stein & Borek of Philadelphia seventeen mining claims of wolfrinite in the Dragon mountain. It is used for hardening steel and heavy ordnance. The purchase price was \$200,000.

At Silver Bell the Nelson smelter is turning out three tons of copper bullion daily from ore taken from the Old Boot mine.—The developments on the Young America have produced several thousand tons of copper ore which average, it is said, about 7 per cent. The tunnel which has been run 400 feet has cut the ore body at a depth of 500 feet.—N. Faison's Silver Hill copper mine has developed a large ore body yielding gold and silver as well as copper. A vein 14 feet wide is claimed for it.

The Sterling Placer Co.'s ground and placer machinery at Walnut Grove, costing \$70,000, is being placed in position and will start in a week. The company has 5000 acres of gold-bearing gravel in the Walnut Grove section.

At the Copper King mines in the Dragons near South Pass the company is at work securing water for the smelter, with encouraging prospects. A large quantity of ore is ready for reduction.—At the Oro mine in the Oro Blanco district work has been resumed and preparations are being made for building a mill.

CALIFORNIA.

Amador.

Sinking continues at the Zeila mine. About thirty of the men who were laid off a few weeks ago went to work again last week.—It is locally reported that development work will soon begin on the Summers mine at Plymouth.—Among the improvements contemplated by the Blue Lakes Water Co. are a large reservoir and a new ditch. The ditch is to have an elevation 80 feet higher than the present one. The improvements will cost upwards of \$400,000, and when finished a new electric plant will be built at White's Bar, on the Mokelumne river.

Dispatch: A 10-stamp mill has been erected at the Pocahontas mill, near Drytown, and a three hours' run on Sept. 1st developed that the mine has ore that will pay \$30 a ton in free gold. Owing to the shortage of water, it will not be possible to operate the mill at present, but the work in the mine is not allowed to lag.—The gallow's-frame of the Douglas M. Co., at Volcano, is completed, and the shaft has been unwatered to a depth of 153 feet. The old timbers are found to be as solid as when put in thirty years ago.

Republicans: At the Bay State, Plymouth, work has resumed.—At the Butte Basin M. Co. sinking, suspended on account of foul air in the shaft, will be resumed as soon as the blower is put in.

Ledger: The Tennessee mine at Pine Grove has struck a chute of ore at the 200-foot level which is 2 feet wide, and the average value assays \$54 per ton. This was formerly the Tellurium mine and was abandoned years ago, the rock being so rebellious that the gold could not be extracted in free milling.—The Amador Queen No. 2, at Jackson, operated by an Eastern company, is sinking the shaft.—The operators of the Douglas mine, at Pine Grove, contemplate the erection of twenty stamps as soon as the grading is finished. The new hoist has started and work is progressing.—The Jackson E. & D. Co. has the Amador Queen No. 1 shaft down 1100 feet, and sinking is going on.

Record: Work is progressing at the Balio mine at Sutter creek. The crosscut from the shaft is in 180 feet, and some good quartz has been found. By the time water comes this property will be in a condition to be worked on a large scale.—The Potazuma M. Co. took out a run of ore from their mine last month and had it milled in the Zeila mill at Jackson. They crushed 140 tons, and the proceeds were \$3825, besides 1½ tons of sulphurets worth \$200. The richest rock was not milled, but will be sent to Seiby & Co. for treatment. There is in the neighborhood of five tons of ore, which assays \$200 per ton. The ledge is from 2 to 4 feet in width.—Men interested in the Douglas M. Co. of Volcano visited the property from San Francisco. This company has been in operation for some time and has expended \$20,000. They have sunk 210 feet on the Douglas claim, and on the old Sorocco mine, which in former years was sunk to a depth of 400 feet, the shaft has been cleaned out and repaired 150 feet in depth. The company is well satisfied with the prospects and will push development.

Butte.

The dredgers being built near Oroville will be afloat Oct. 1, and machinery will be placed.

Calaveras.

At Sheep Ranch the Sheep Ranch mine, which has not been worked for five years is preparing to resume work. There is about 1100 feet of water in the shaft, but a tunnel is being run to the shaft at the 300 level. The gallow's-frame is ready to be hoisted. The

machinery will be run by compressed air and electricity. A new mill will soon be erected to be run by electricity.—At the Gwin mine the steam power plant is about completed and it is expected to have everything in running order by the middle of the month.—River bed mining in the Mokelumne this season is carried on to good advantage as the river is low, and a large number are taking advantage of the situation.

Near Angels Camp the water in the Coleman mine broke through and flooded the Lightning mine up to within 125 feet of the surface this week.—At San Andreas the strike of a rich lead while crosscutting at the 700-foot level at the Ford mine is reported. The vein shows a width of 20 feet.

El Dorado.

Work is being done by E. W. Chapman at the Gold Note and Philadelphia mines at Omo. Rollers, engines, hoisting apparatus and air compressors are being hauled in. About fifty men are employed.

Inyo.

The Independent reports a favorable outlook for a deal in the upper belt of mines around Pleasant canyon, Panamint mountains, including the Montgomery properties and Radcliff mine.

Kern.

Los Angeles Review: The Johannesburg Reduction Works cleaned up last week a fifty-eight ton run of Black Hawk ore that averaged \$27.40 per ton.—P. McMahon, Mgr. Wedge mine, has taken a lease to sink 100 feet and drift 100 feet each way on the Little Butte extension, and the Little Butte Extension Co. will soon resume work on the shaft.

Mariposa.

A corporation headed by J. Moss of the San Joaquin Valley railway is developing a slate quarry near Hornitos.—Work has begun on the Houghton mine by an incorporated company.

The following is a Boston report: "G. M. Hyams has returned from his inspection of the late developments at the Merced gold mine, and reports that the company has now at Coulterville a gold mine, but not a large one as at present developed. The single ore chute upon which the last six months' developments have been made, has continued to make a good showing as depth has been attained, and the management is well satisfied that at this point it has a paying gold mine. It has been decided, therefore, to start up the Merced mill and expend the profits from the milling of the present developed bodies of ore in endeavors to find more paying ore chutes. The property is a very extensive one geographically, but does not warrant extensive operation unless more paying gold chutes are uncovered. It is believed that the present ore chute, even if yielding only \$1 per ton profit, will furnish sufficient money to make a thorough test of the entire property."

Merced.

At Hornitos Mr. Hutchings of Coulterville is sampling the tailings from the old Washington mine.—It is locally reported that work will be resumed shortly on the Yellowstone mine.

Nevada.

The bedrock tunnel at the Malakoff mine at North Bloomfield is in about 500 feet and it is expected that the channel will be reached in another 400 feet.—Operations have begun on the old Slide mine at French Corral and twenty men are at work.

A strong flow of water was encountered in the Mountaineer mine, Nevada City, on the 1200 level, and the pumps are having a hard time to handle it.—It is said that operations will begin soon on the Pawning mine at Grass Valley.—J. A. Lipman & Co. have bonded the Rising Sun mine in Maybert district and have begun work.

The Old Home Con. M. Co. has levied an assessment of 2 cents per share, delinquent Oct. 8.

Placer.

Near Rocklin Hart & Ross have been operating eighteen months, and are employing ten men. The pay gravel is 40 feet from the surface and varies in depth. It is of cement formation and is pulverized by the arrastra system.—At Ophir W. P. Black has bonded the Boulder mine and will develop the property.—The Eclipse mine has closed down temporarily.—Development work is being crowded at the Bellevue mine and the prospects are encouraging.

The Mayflower G. M. Co. has levied an assessment of 5 cents per share, delinquent October 10.

Plumas.

Bulletin: Mining on the North Fork in the river bed will be in operation before the end of the month.—At the Golden Gate quartz mine near Quincy the owners sank a shaft and crosscut the ledge, disclosing a body of ore 3 feet wide and prospecting well in free gold. There is ample water on this claim for a mill.—At La Porte the Alturas M. Co. controls three miles of the creek bed. During the last forty years this stream has been the outlet for the debris from the Gibsonville, St. Louis, Howland Flat and other mining districts. A hydraulic elevator is in use. The length of the gravel carrier is 100 feet. The debris piles up in the shape of a levee. The Alturas Co. have two of these machines working and twenty-two men employed. During six months about 1000 feet of a channel 150 feet wide is mined. The property is paying well. The company furnishes its employees cabins, cooking utensils and tools and pays them \$2.50 a day, the men boarding themselves.

Independent: Mrs. Gruss has made a discovery in the Genesee gold mine, near Genesee, of much value. For years the owners of this and adjoining mines have looked for an oxidized black formation, which was rich, the quartz being thrown aside as of no value. Five years ago a cut 12 feet wide was run into the hill and through an 18-inch vein of quartz, which interposed, in search of this black ma-

terial, and, failing to find it, the work was abandoned. Recently it was discovered that the ledge through which the cut had been made was rich in gold. Five stamps are turning out \$1000 a day.

Riverside.

At Winchester Mott Bros. have temporarily discontinued work at their asbestos mines.

San Bernardino.

At Canyon del Oro district the new gold find continues to develop. There are over fifty claims located, some producing high-grade ore.

The Colton Chronicle says the water question at Lytle Creek is apt to get into the county courts, as J. C. Christy claims that he will not stop his hydraulic mining, as his claim to the water is over a quarter of a century older than that of San Bernardino. He has taken out \$55,000 from his mine and does not propose to quit just at present.

Shasta.

(Special Correspondence).—In several portions of this county where properties were abandoned years ago, either because the ores were not free milling or because their treatment was not understood, work is being resumed quite extensively. New prospect work is also being followed to greater extent than has been done for many years. Much of this is due to the impetus given by the Mountain Copper Co. in the purchase and, also, custom treatment of ores. Old dump piles of ore, that were considered waste, have been tested by the newer treatments and found to be of value.

Not all the sections of Shasta county are base metal regions. New properties are being opened that have free milling ores. Mines, too, that have been worked to only 200 feet, are being pushed to greater depth, and find either a lost ore body or an improvement in the existing ledge by smelter treatment.

The Mountain Copper Co. has bought a large group from individuals and the railroad company one mile northeast of the Iron Mountain mine. They have put on a large plant of machinery and done considerable development. The ledge is 60 feet wide, of low-grade ore. The company's railroad will be extended to the property.

The great copper belt of this county begins at Iron Mountain and follows a northeast course in a semicircle for twenty-five miles. At various points on this belt exploiting is going on by men of means. Principal among these are the company of Berlin and Dusseldorf capitalists; the Lewishow Bros. of New York; Salee & McDonnell, and a number of smaller operators.

D. McCarthy is furnishing the Copper Co. thirty tons daily of ore for fluxing, at \$1.75 per ton at his mine. In addition, he is storing a good grade of ore.

The Mount Shasta mine, about two miles from Shasta, in which O. O. Howard Jr. of San Francisco recently became interested, has reached 140 feet depth on a 3-foot ledge containing a streak of high-grade ore. The ore is shipped to the smelter at Keswick.

In the same neighborhood Herrin & Leetch are taking out a blue quartz that carries good values in free milling ore in a ledge running from 6 inches to 4 feet in width.

Near Muletown, J. Christensen is successfully opening a paying property.

In the Black Bear mine work has been resumed cleaning out the tunnels—one 175 feet and the other a 350-foot crosscut. The property has been idle for five years. Ore from the old dump has been sampled at the smelter and shown to be of fair grade.

Pugh & Messell are putting up a mill on Clear creek, near Shasta, to mill ore from two meritorious mines.

In the One section the outlook is encouraging. The Bullychoop mines are about to be reopened, probably by an English corporation.

The old Sunny Hill mine, which in its day has been a rich producer, and is now owned by the Mariscano Co. of San Francisco, is still idle, though it is known to some of the company that this is a property of merit. Together with its regular ledge this mine some years ago yielded a pocket 60 feet long, 3 feet thick and 30 feet high—supposed to be the largest ever found in California. The average value of the ore was \$200 a ton. The property had been worked only 200 feet deep. The present company ran a 1500-foot crosscut tunnel and cut the ledge at 600 feet depth. They found the same character of ochre ore that paid richly when worked by the first owners, but by the latter supposed to be barren, yet, when induced to assay it, found it to run \$153 in gold. Resumption of work on the mine, it is said, will be an agreeable surprise to some of its present owners in the outcome.

The Black Spider mine, near Keswick, is about to be reopened by a San Francisco man.

The old Phoenix, on Clear creek, is being exploited for San Francisco people. This is a 60-foot ledge of low-grade ore running from \$2 to \$4.75 per ton.

Redding, Sept. 12th, '98.

Mr. Campini of San Francisco bought the interest of C. Flick in the Flick, Stolberg & Maurer mining claims near Shasta for \$3000.

Sierra.

The Gold Valley mine near Downieville is down 400 feet, with the 200 and 300 levels well developed, and carries a 10-foot ledge of medium grade ore; it has yielded \$70,000 in two years. It is a contact vein with slate hanging and diorite footwall. It has a 25-stamp mill run by electricity, and a chlorination plant of four tons daily capacity. The reverberatory furnace is 70 feet long and 13 feet wide. The chlorinating vats are of two and one-half tons capacity. Fifty men are employed.

At Gibsonville the Schofield Bros. are running a tunnel, which is in 1500 feet.—The Crown Point Co. has begun operations and expect to strike the pay channel by a tunnel of 400 feet in length.—Spencer & Gould have their claim in readiness for water.

F. B. Hill of Colorado has bought the Ori-

ental mine, near Allegheny, from C. Heintzen, the owner. The Oriental has been idle eighteen years. It has been worked to a superficial depth and has produced \$3,000,000. From one pocket \$740,000 was extracted. Work will begin on the property without delay.—In the Plumbago, after driving 1500 feet, the pay chute has been discovered and is a good body of ore. The air compressor plant is well under way. There will be 120 H. P. generated; and after transmitting it a mile to the mine, the air will be reheated and applied. The improvements at the Plumbago will cost \$25,000.

Siskiyou.

The miners in the several river claims at the Klamath have not been taking out much gold yet, but expect to do well on their second cuts.—In the Pacific mine at mouth of Humboldt creek, Klamath river, night and day shifts are busy, with prospects of success.

The tunnel being run through the Humboldt range on the west side of Yreka, as a prospecting venture by a company of Yreka business men, is in 500 feet, and has tapped quartz containing iron and sulphurets in large quantity.

The Golden Eagle mine, near Fort Jones, idle since 1860, is to be developed in an extensive manner. It is the intention to commence sinking in a few weeks, going down 500 feet and running crosscuts at each 100-foot level.

Alta Advance: J. H. Smith of Portland has purchased the Knownothing mine from Bennet & Bevans for \$20,000, and is developing the property, and as soon as it is in good shape machinery will be added.

Journal: The Barton windmill claim at Oak Bar is paying well. A large force is employed.

McCaw & Co. are opening the ledge on Patterson creek recently purchased from Fry & Macaulay, which prospects well. It is 20 feet wide and is believed to be a lode of value. They have also bought the Lina mine adjoining.—W. G. Stanley & Co. are running a tunnel in the Hoboken mine on Cherry creek. The ledge varies in width from 6 inches to 2½ feet. It contains sulphurets in large quantity.

Mr. Bromley, who has charge of sinking the prospecting holes along Yreka creek, has fifteen more holes to complete the work, and when finished the managers of the enterprise, Souther & Gardener, will come to a conclusion about putting in a dredger.—A Chinese company at work near Oak Bar, in Klamath river, has been taking out rich pay.

Another Chinese company working a bar near Oak Bar is down to bedrock and doing well.—The Distlehorst & Barton Dredger Co. has found rich prospects working into a bar in Klamath river at the mouth of Horse creek. Scrapers have been used in taking off the surface down to water level, and the dredger will remain at that point until the winter rains raise the river.

News: Seattle men represented by J. W. Martin have made the first payment on the Cape mine.—S. R. Gardner of Oro Fino, has purchased a fourth interest in the Bunker Hill hydraulic mine, near Happy Camp, and has secured control of the entire property for \$20,000. He is putting the mine in order for the coming season's work. Two new giants are being fitted up.

Tuolumne.

The Atlas M. Co. are driving a drain tunnel into their properties near Tutletown which will be half a mile in length.

Independent: A good strike has been made in the Sonnet claim near Sonora. The vein is 18 feet wide, 3 feet of this being fair grade. The remaining portion is of low grade but payable. The owners are T. Lane and E. C. Davis.—The Jubilee G. M. Co. are erecting a 40 H. P. steam engine and a four drill compressor. The tunnel is in 400 feet.—E. B. Barner, operating for foreign capital, has begun work on a tunnel to tap the Atlas mine at Jackass Hill 500 feet from the surface, and when completed will be 2000 feet long.

Democrat: The Excelsior mine near Sonora, which has long been idle, has been secured by the Bodie Standard Con. M. Co. R. C. Turner is Supt. Men have been put to preparatory work for the extensive operation to be done in the spring.—The new hoist at the Mazepa will be running the 20th, when sinking will be resumed.—In the shaft on the Brewer & Adams sinking is progressing. The vein is 20 inches wide. A steam hoist is contemplated.—At the Kanaka at Groveland operations go ahead rapidly. The mill runs twelve hours out of each twenty-four, enough water being secured to drive the machinery.

COLORADO.

The Miners' Union at Victor, Colo., is building a \$30,000 opera house.

The daily ore output of the Leadville, Colo., mines is 2000 tons.

BOULDER COUNTY.

While doing development work the Adit tunnel at Ward has taken out during the year \$60,000 worth of ore, which almost balanced the expense of equipment and work, which reached \$63,000. The tunnel has been driven 991 feet this year, making a total length of 2727 feet. The Ni Wot branch has been driven 245 feet. In a crosscut there are 14 inches of smelting and 5 feet of mill ore. A big body of ore is also opened in the upraise. Sixty men are on the payroll.—The Virgin mine in the Eldora district is taking out ore that proves the high-grade values claimed for the camp. The ore shipped last week returned \$11,500 per ton in gold.—In the Enterprise mine on Spencer mountain the shaft is going down 100 feet deeper, and is in ore which improves with depth. There are 500 tons of low-grade ore on the dump, and the amount of high grade is being increased.—The new pyritic smelter, near Ward, will soon start up. If the process proves a success, there are many thousand tons of low-grade ore in the district that will at once become valuable.

CHAFFEE COUNTY.

Ho Hoy, the Chinese manager, is pushing work on the Lalla Rookh at Turret. In the

shaft are 26 inches of ore which gives values from \$46 to \$76 in gold per ton under mill-run tests. The property is owned by a California company. Large veins of low-grade ore are being opened in the Heron Park district. The veins are from 12 to 36 feet wide, and the ore runs from 60 cents to \$12 in gold per ton. A depth of 600 feet will be gained in some of the tunnels. The tunnel on the Ethel T. Whitehorn district, has opened up a vein 2 feet wide composed of thin layers of quartz and slate.

CLEAR CREEK COUNTY.

Denver capital is successfully operating the Edwards placer, at the mouth of Chicago creek. They struck bedrock at 18 feet and found coarse gold. They also found that the shaft was on a well-defined vein in the bedrock. Denver capital is developing a section of Clear Creek county near Idaho Springs that has been considered a ranch region. Float has been found that assays from \$200 upwards.

DOLORES COUNTY.

The Enterprise mine at Kico is again in operation and from 80 to 100 men are employed and the shipments average four cars a day. The average of the ore produced during 1897 was 2.15 ounces gold and 170 ounces silver per ton. The Laura claim of the group will be operated through the Onomo tunnel, which will open the mine at the 250 level and expose a large body of low-grade ore.

EAGLE COUNTY.

The Iron Mask group of Battle mountain is working in high-grade sulphides and making regular shipments of 242 cars a month.

EL PASO COUNTY.

At Cripple Creek the Anaconda Co. is outputting at the rate of thirty tons per day of mill ore running \$20 a ton. From the Kittie M. two shipments have been made from the new strike that went \$30 per ton. The ore shipments over the Golden Circle Railway show an average of forty-five carloads a day for the past month. Goldfield is sending out thirty and the others fifteen. Potvine & Vaine of the Christmas closed a 90-ton shipment recently of ore that yielded \$40 a ton. The ore body found on the 400 level of the Midget is improving with development. The ore chute is 30 feet long, with an average width of 42 inches. Official estimates place the earnings of the Elktion mine, Cripple Creek, during July and August at \$50,000 net. The Vindicator Co. shipped only 1000 tons in August, which was less than usual. The values of ore, however, were of a higher grade. Other portions of the property worked under lease shipped about 800 tons. The total production of the Lafayette last month was 200 tons, some of it running fifteen ounces. R. W. Petie, treating dump ore at the Lillie mine, received from the first carload shipment of sediment saved from the washings of the rock \$110 per ton, while the screenings went \$80. The sale of fifty acres of placer ground near Cripple Creek was made by E. Bell to J. R. McKinney for \$13,000 cash.

On the Johnson lease of the Half Moon the output for August was 1200 tons, with a gross value of \$60,000. The Hart group of thirty acres near Cripple Creek was sold last week to J. R. McKinney and others for \$50,000.

GILPIN COUNTY.

During the month of August there were 460 stamps dropping in the Black Hawk mills. The greater part of the work was done on Gilpin county ores. Some company mills will be added to this list next month. Considerable new ground is being opened and September will show a marked increase. Lessees on the East Notaway mine shipped five and three-fifths tons of ore last week and received \$5,827.90. There were two classes, the first worth \$1200 per ton, the second \$800. A carload of regular ore ran \$45 per ton.

The shaft on the Robert Emma mine, Maryland mountain, has been retimbered. It is 300 feet deep and is ready for the cage. The ore is a good grade of gold and there is enough to place the mine among the big shippers of the camp.

LAKE COUNTY.

The 10-stamp mill of the Penn Leasing Co. at Leadville has proved such a success, and the ore bodies in the mine have increased so rapidly, it is proposed to enlarge the capacity to 100 stamps. From one shaft fifty tons of dry silicious quartz are hoisted daily and sent to the smelter. It is estimated there is \$500,000 worth of ore in sight. The Resurrection G. M. Co.'s daily output is 150 tons. The company owns between 400 and 500 acres of patented ground. The Little tunnel is in 1150 feet and a contract has been let to drive it 300 feet farther. The Ixex M. Co. is daily sending to the smelters about 325 tons of dry silicious oxides and copper iron sulphides. The biggest shipper in the Kokomo district near Leadville is the Colonel Sellers, with its output of 175 tons daily. The ore is an iron sulphide, the iron excess being valuable, and good values in gold and silver are also carried.

OURAY COUNTY.

(Special Correspondence): The O. & N. and the American Nettie, situated on the mountain side, about 2000 feet above Ouray, are known as the gold-belt mines. They produce high-grade gold ores which exist in contact formation and consist of both sulphides and oxidized material. The O. & N. has produced \$200,000 within the last two years. The work on this property now is mainly for development purposes.

Up Dexter creek are the Khedive, Bachelor, Wedge, Caliope and Old Maid, all of which are working good forces. The ores in this belt are a galena and gray copper, the main values being silver and lead. The Bachelor and Khedive, under the same management, operate a concentration mill.

The Caliope, consisting of mine and mill, ships ten cars of concentrates per month to the smelters. This is an old property, reopened within the past year. Mgr. F. A.

Sparks states that the ores run 125 to 200 ounces silver and 40% lead.

The Mineral Farm, near Ouray, was reopened this year after five years of idleness. It has a concentrating mill and is shipping small batches of ore, carrying silver and gold in sulphides and gray copper. The property belongs to R. J. Lucas of St. Louis and is superintended by E. T. Haughey.

The Ouray matte smelter, belonging to the Cleopatra M. & M. Co., is handling about 2000 tons of ore per month. The district furnishes the limited amount of copper ores required to produce the matte. As a fluxing material, iron ores from Ironton are used to a limited extent. This plant disburses about \$20,000 per month at Ouray.

The properties of the Caroline M. Co. are near the base of Mt. Sneffles, eight miles from Ouray, toward Telluride. They consist of the Revenue tunnel, the Virginus mine and a concentration mill of 400 tons per day capacity. The mill, air compressor, ore cars and hoists are operated by electricity, generated by water power in the canyon three miles below.

The Revenue tunnel is about 7x8 feet, double-tracked, electric-lighted and goes in 7500 feet, crosscutting the Virginus vein. Near the breast of the tunnel an incline shaft upraises, at a 45° angle, 1400 feet on the vein to a station, which connects with a 900-foot vertical shaft from the surface. Thus the tunnel, incline and shaft described form the basis of the extensive underground workings. The tunnel drains the property of about 1500 gallons of water per minute, the latter being utilized to some degree in the mill. The ores produced are a sulphide of lead, with streaks of gray copper, the latter carrying high silver values. From 180 to 200 tons of ore per day are shipped from the tunnel, the most of which is concentrated. The mill, in charge of W. A. Garrett, has sixty stamps, six Huntington, four crushers, four sets rolls, twelve Wilfleys and a drier. The concentrates are reduced to one-half inch and one-fourth inch sizes and five tons of ore to one ton of concentrates. Mr. Crusher is mine superintendent, A. E. Reynolds of Denver is Gen. Mgr. A force of 600 men is employed.

The Camp Bird mines are in Imogene basin, on the opposite side of the range from Savage basin. The vein here trends along a few hundred feet below the crest of the range and is opened by four different crosscuts, the principal one cutting the vein at 620 feet. The ores carry high values in gold, about fifty tons of which are milled per day at the company's water-power mill two miles below. The altitude of Camp Bird mine is 11,400 feet above sea level.

Ouray, Colo., Sept. 6th, '98.

The Fowler smelter at Ouray is receiving ore from thirty properties, more than twice as many as were contributing at this time last year.

PITKIN COUNTY.

Aspen: (Special Correspondence).—While the ore tonnage of Aspen has greatly fallen off since the days of the '80s, it still remains one of the most interesting mining districts in the State. The operations here are not only on a large scale, with first-class equipment, but the methods generally have been up to date and scientific. The Cowenhoven tunnel, which penetrates Smuggler mountain a distance of 2½ miles, was not the conception of a stock schemer, nor was there any visionary purpose about it. It was driven primarily for drainage of the then partially exploited mines of Smuggler mountain and for the transportation of their ores. Incidentally, there were other accruing benefits; but with the two main purposes in view, the promoter and executor of the project had the co-operation of the principal property owners on the premises named. It stands to-day as one of the most successful tunnel enterprises in the State, because it has constantly received a profitable revenue from the mines which use it. At present the tunnel is utilized by the Della S., Alta Argent, Homestead, Bushwhacker, Park Regent and Mineral Farm, which ship through it 6000 tons of ore per month.

Near the base of Smuggler mountain are the Mollie Gibson and Smuggler mines, whose workings are by means of shafts which sink 1000 feet below the level of the Cowenhoven tunnel, making it necessary for those two properties to operate powerful pumping plants to keep out the water.

On Aspen mountain, which is on the opposite side of the town from Smuggler, are the Argentum-Juniata and the Aspen groups, the former having to pump its surplus water, the latter being drained by tunnel work. The Durant, Millme, Enterprise, Veteran, Iowa and Camp Bird are likewise important groups on Aspen mountain.

The products of the district, as is generally known, are silver, lead and lime ores. The values in silver range from 20 to 40 ounces per ton; lead values vary from 5% to 12%; ores from various properties carry from 30% to 45% lime. For the lime the smelters pay 10 cents per unit, which often overbalances the treatment charge on a given quantity of silver-lead-lime ore. As a result of the lime ores becoming such a factor of late years, and the reduction of freight rates and smelting charges, it is now possible to ship a lower grade ore from Aspen than in former years, when the price of silver was higher.

In the properties drained by the Cowenhoven tunnel a large proportion of present production is by lessees, who pay royalties ranging from 10% to 50% of the smelter returns.

The Mollie Gibson and Argentum-Juniata, separate properties, but worked under one management, are concentrating about 4500 tons of ore per month. Together they operate a mill equipped with crushers, jigs and twenty-two vanners.

The Smuggler and Durant groups, under the same management, ship 2000 tons per month to the smelters, 800 tons of which are concentrates and 1200 tons crude ore. This

property operates two concentration mills, aggregating about 125 tons capacity per day, in one of which is a new type of concentrator, designed by Supt. S. I. Hallett.

The Aspen group ships about 800 tons of ore per month, which runs about 40 ounces silver and 7% lead, with a high percent of lime. The Bushwhacker, controlled by the Aspen Co., and worked by lessees, ships about 750 tons of crude ore to smelters and 1000 tons to concentrators per month.

The Millme ships about 1500 tons and the Iowa and Camp Bird groups about 250 tons per month.

The Mineral Farm produces 800 tons per month, mainly by lessees. The company, however, is sinking a three-compartment working shaft from the Cowenhoven tunnel, to be equipped with an electric hoist.

The Aspen Contact, on Woody creek, is being worked by three sets of lessees. The Bi-metallic, eight miles north of Aspen, is not working.

The only gold property in Pitkin county, it is claimed, is that known as the Hunters' Pass mine, eighteen miles east of Aspen. It is an old property recently infused with life and managed by C. H. Munger. The property is worked through a tunnel, the ores carrying gold in iron and copper pyrites. A new 30-stamp mill, equipped for amalgamation and concentration, has been operating since July 1st.

The Aspen concentrator, operated by G. W. Thatcher, has forty stamps, twenty-five concentrating tables and is handling seventy-five tons of ore per day, which is reduced in the ratio of six to one.

It is estimated that the Aspen camp ships about 12,000 tons per month to the smelters. The deepest workings in the district are in the Mollie Gibson, reaching 1200 feet.

Aspen, Colo., Sept. 1st, '98. WASCOTT.

PARK COUNTY.

H. E. Pease has sold to the Kansas-Burroughs Con. M. Co. for \$7500 a portion of the Kansas lode, Nevada mining district.

SAGUACHE COUNTY.

Creede never showed more progressive mining activity nor better results. The Old Solomon is keeping up its big output, with twenty-five men on the payroll. A large body of low-grade ore has been opened in the Revenue tunnel in 1500 feet. Prospects in different parts of the camp are looking like mines, and the mills have all the work they can do. The ore is generally a concentration proposition, low grade but with good margins on account of the large and easily handled bodies. The Nelson tunnel is 6000 feet in and the effects are beginning to be visible in the lowering of the water in lower levels of the Last Chance and Amethyst. The camp is working 500 men and shipping an average of 300 tons a day.

SAN JUAN COUNTY.

In the tunnel on the Mabel claim near Silverton a 6-inch streak of talc is found which carries \$50 in gold and \$33 in silver. Accompanying the talc is a small streak of quartz which runs \$180 in gold per ton. The Ridge-way mine is shipping two carloads of ore a week.

SAN MIGUEL COUNTY.

The North American Expl. Co., near Telluride, owner of the Nellie and Ella mines, has bought the Star Gazer lode for \$15,000, a cash payment of \$5000 being made. A company of New York capitalists, headed by Horatio Page and J. N. Huston, has bought twenty-two claims near Telluride, and will extensively develop and equip the property without delay. From the Ophir district weekly shipments have been increasing until they have reached twelve carloads per week. This is from the old mines of the district. The Tom Boy mine and mill, Telluride district, is handling 150 tons of ore daily. It requires 100 men during the day and 75 men at night to keep work going.

SUMMIT COUNTY.

The El Dorado mine at Robinson is shipping forty tons daily of sulphide ore, mined at a depth of 1100 feet. Since the sale of the X. L. mine, in Ten-mile district, men have been put to work and are rapidly getting it on a producing basis. The product is a gold-lead combination, the values being 70 per cent lead and \$20 in gold per ton.

IDAHO.

In the Bull Dog mine near Ketchum the lode is 40 feet wide. The property is being developed by C. Crane of Salt Lake City.

Near Centerville there are twenty-one men working on the Twin Sisters mine and mill.

The Elkhorn is being opened up. A force is at work cleaning out the old stopes and tunnels. The mill has been started. Forty men are working on the Morning Star mine. It is announced that the company contemplate a tramway to the Payette, a distance of two miles, and there erect a 50-stamp mill. Fifty men are at work on the new dredge near Centerville. At Wallace the Father Lode tunnel has 2 feet of ore that is nearly a shipping grade and considerable concentrating ore additional.

The dredge below Warm Springs is running night and day. The boat is lighted by electricity. Magee Bros. of Pittsburgh, who own the Morning Star group of quartz claims near Grimes Pass, have bought the Bunch quartz claim near the Morning Star.

The Twin Springs Placer Co. on the upper Boise has made a satisfactory clean-up since the water was turned in last month. The electric light plant is completed and everything is being put in shape for next season's work. They will run until about the middle of December, and the mines start up again in the latter part of February, making a shut-down of less than three months.

At Kingston the Idaho Antimony M. Co. is again running its plant to its full capacity, employing twenty-five men. It has now passed the experimental stage, and the work from this time on will be of practical nature. This

is said to be one of the few deposits of antimony being worked in the United States.

MICHIGAN.

The Oliver M. Co. is studying the matter of drying their ores before the latter are shipped from the mine. Mgr. N. P. Hulst says that the moisture contained in the ores to be sent out this season represents about 90,000 tons. It is said that, after drying, the ore takes no moisture from the atmosphere when placed in stock. The space occupied by the ore would be the same, and might be somewhat increased, but the weight would be 12 per cent less. More tons of ore could be transported in a boat load. Ninety thousand tons of water is a big amount to ship from one mining concern in a single season.

MISSOURI.

The Joplin News says: "The feature of last week was the tremendous bulge in the zinc ore market. There was a net advance of \$2.50 per ton on high-grade ore, and thirty-two cars sold at that price, but the advance was even greater on ore of the lower grade, the price in some cases bounding up \$3 to \$4. Every mill is running to the limit of its capacity and double shifts are tearing down ore in the mines at a rate to astonish miners of five years ago, all in the effort to make big sales while the price hangs round \$30. The spelter market kept pace with the advance of ore, and the price went up to \$4.60 with no offerings, and the metal strongly held. In fact there is no spot spelter and none for August delivery to be had, and September spelter will sell for \$4.75 this week. The lead market also advanced. Ore sold at \$24 and was in demand at that price, which is 50 cents per 1000 better than last week's price. The big lead market is strong and the metal in demand at \$4 with a certainty of better prices this week."

MONTANA.

At Sterling the lessees of the Galena mine shipped two carloads of ore which netted \$90 per ton.

The shaft of the Anaconda Co.'s coal mine at Carbonade is down 900 feet, and the 50-foot stratum of sandstone which overlies the coal vein has been penetrated. It is expected that the company will be shipping coal in the course of a month or so. The Silver Tip mine at Libby has been bonded to H. G. Lougee for \$15,000 and a cash payment of 5 per cent of this amount.

A fourth interest in the Graham, Legal Tender, Tip Top, Mountain Chief, Fraction, Iron Duke, Mary, Lippett, Golden Butterfly and Roger Williams quartz lodes, sixty acres of placer ground and water rights near Livingston were sold at sheriff's sale last week to satisfy a judgment and costs of \$40,788.78. The property was bought by G. O. Freeman for Receiver Wilson of the First National Bank of Helena. At the Moulton mine at Neihart twenty men were working on the 300-foot level, cleaning out and working on the stopes, but the water raised faster than the pumps could handle it, and most of the men were laid off, and the tanks put to work again to enable the pumps to be lowered and set further down. Temporary guides will be put on and the tanks kept going until the pumps are reset.

Picket: The Rocky Fork Co. at Red Lodge will shortly increase the output of their coal mines from 1000 to 1500 tons per day. To this end an extra track will be laid the full length of the slope, giving the workings 4800 feet of main track. There never was a time in the history of the Rocky Fork mines when the demand for the output was so great as it is at the present, and to keep up with the increase in the orders pouring in the company is extending its underground workings on the main vein 1100 feet. With every foot of extension the large vein increases in width and the deeper the mines the better becomes the coal. The regular monthly payroll of the mines aggregates \$30,000. The Never Sweat shaft of the Anaconda Co. is being rapidly pushed to the ultimate end—5000 feet. It is said that at that depth bodies of high grade ore have been found with the Diamond core drill, and the expense of sinking the costly shaft will not be in vain. Much of this work has been accomplished at a cost not exceeding \$1 per foot. The New Year mine at Fergus Falls, comprising five claims, has been bonded to Wright & Johnson of Denver, Colo., for \$50,000 for two years. The bond provides that the lessees shall expend not less than \$400 per month in development work and pay \$1 per ton royalty on all ore mined, to apply on the payment.

NEVADA.

The ore shipments from the mines of Eureka and Hamilton districts for the last week were 555,660 pounds.

The Wilson Ore Tailings Leaching Works at Pine Grove, Esmeralda Co., were recently destroyed by fire. At Silver Peak work on the Mary mine is progressing and they are extracting good ore. The contractors in the Drinkwater tunnel are making good headway. Case & Jaegels are taking out ore from the Homestake and A. Valencia & Co. are at work on the Bourbon mine and have a large ledge. At New Pass the mill is running steadily at the Bell mine and the returns from the ore are satisfactory. At Tuscarora the Dexter Co. is rushing the work of obtaining additional power and will have their 40-stamp mill running inside of sixty days. The Eira is producing three carloads of high-grade ore per month. L. Parsons is reported to have struck an ore body over 100 wide. Judge Talbot is said to have struck pay ore. Twelve men are employed sinking three shafts. The new mill at the Reno mine in Como is dropping ten stamps successfully. The mill is running twelve hours out of twenty-four. A force of 300 men is employed in performing work on the iron deposits at Lovelock to perfect title for patent. A broad gauge railway to connect with the Central Pacific is included in the plans of the

owners of the property, who are Eastern capitalists.—The articles of incorporation of the Era M. Co. at Tuscarora, recently filed with a capitalization of \$10,000, have been changed to a capitalization of \$250,000.—Supt. Berthelot of the Bald Mountain M. Co., near Elko, has paid off his men and closed down the property until next spring; scarcity of water.—The Alta mine and mill at Virginia are closed down, the last lot of ore not proving sufficiently profitable to warrant a continuance of operations in that part of the mine.

The report from the committee of Comstock superintendents on proposed drainage and deepening was prepared and ready on the day set—the 14th inst.—and on the following afternoon the executive committee met in the Nevada block, this city, to receive it. There were present Charles H. Fish, Charles Hirschfeld, George R. Wells, W. G. Morrow, C. L. McCoy and John Sanders. The report is as follows:

VIRGINIA, Nev., Sept. 12, 1898.

Charles H. Fish, Esq., President General Committee on Comstock and Deep Mining, San Francisco, Cal.—DEAR SIR: In response to the request of your committee for information concerning the levels of the Comstock mines below the Suto tunnel, we respectfully submit the accompanying reports, which are summarized from the weekly and annual reports of the superintendents who had charge of the mines from 1886, before deep mining was suspended, which said reports detail the exploratory work done in the levels below the Suto tunnel in the several mines, to-wit: Utah, Sierra Nevada, Union Mexican, Ophir, Con. California & Virginia, Best & Belcher, Gould & Curry, Savage, Hale & Norcross, Chollar, Potosi, Yellow Jacket, Crown Point, Belcher, Overman, California, Alta and Justice.

The reports show that in several of the mines mentioned pay ore was found below the level of the Suto tunnel, at points ranging from the 1800 to the 3300 level, which was the deepest point reached. The opening and partial prospecting of the lower levels was done in constant fear of encountering water in excess of the pumping capacity, and the history of the Yellow Jacket deep workings shows this fear to have been well founded.

The great width of the Comstock lode calls for an enormous amount of development work in each level below the ground can be said to have been thoroughly prospecting. In illustration of this fact, attention is directed to the great yield of ore from the Crown Point, Belcher, Yellow Jacket, Chollar, Hale & Norcross and Consolidated California and Virginia mines (bonanzas) after they were supposed to have been worked out.

In the light of such developments as were made in the vicinity of the Comstock bonanzas, and the counteracting water in excess of the pumping capacity in the north end mines, it can be truly said that there is not a level on the Comstock lode that has been so thoroughly prospecting that there is not a chance of finding ore in it.

Becker in his "Geology of the Comstock Lode" says: "The first condition for the formation of a quartz bonanza is an opening to receive it. The group of mines worked through the Union shaft and the Yellow Jacket, Crown Point and Belcher mines show peculiarities of structure which point to the likelihood of such openings at lower levels. Openings such as that which contained the Consolidated California & Virginia bonanzas, however, gave almost no warning of their approach from above, and may at any time be struck in the intermediate mines."

With modern pumping appliances placed along the lode so as to pump the greatest quantity of water at the least possible cost, we feel safe in saying that all of the water that was encountered in the lower levels can be handled for very much less than the former cost, and at the same time providing for pumping much larger quantities of water than was found in all of the deeper workings. Such machinery would enable a thorough exploration of all the lower and still deeper levels to be made in safety, while the old system allowed only partial prospecting, and in some cases the levels were barely opened when the work was suspended.

In conclusion, we wish to state that in consideration of the fact that it has been figured that a modern pumping plant can be operated on the lowest levels of the Comstock lode and pump the water to the Suto tunnel for one-twelfth of the cost of pumping by the old system, and assuming that such calculations can be verified, and then considering the favorable prospects that were encountered together with the great area of unexplored ground on the lower levels, we do not hesitate to advise the expenditure of the money necessary to install and operate a complete modern pumping plant for the drainage of the lower levels of the Comstock lode. (Signed)

D. B. LYMAN, ex-Superintendent Ophir, Mexican, Union, Utah and Con. Cal. & Va.
G. McM. ROSS, Superintendent Con. Cal. & Va., Ophir and Mexican.

P. KERWIN, Superintendent Gould & Curry and Best & Belcher.

A. C. KYLE, Acting Superintendent Union and Sierra Nevada.

H. W. GORHAM, Superintendent Savage, Chollar, Potosi and Crown Point.

JOS. R. RYAN, Superintendent Hale & Norcross and Andes.

W. E. SHARON, Superintendent Yellow Jacket, Belcher, Seg. Belcher, et al.

A. JACKEY, Superintendent Overman and California.

E. D. HOYLE, Superintendent Alta and Lady Washington.

JAS. H. KINKEAD, Superintendent Occidental and Kentuck.

CLAYTON BELKNAP, Acting Superintendent Justice.

A. C. HAMILTON, Superintendent Alpha and Eschweiler.

R. PRENDERGAST, Superintendent Bullion.

The report, after being read, was ordered submitted to the immediate consideration of the general committee.

NEW MEXICO.

A strike on the Corena at Cochite assays twenty-three ounces gold.—A large cyanide plant is to be set up at the Crown Point mine.—The Andrews cyanide mill, Sierra county, is treating fifteen tons of ore per day from the Trippie mine.—J. E. Collard is saving 90 per cent of the value of the Mastodon mine ore at the Porter mill, Hillsboro district.—At the Wicks mine Supt. Williams is working eight men and has the shaft from the 300-foot level down 90 feet. At this depth the ore vein is 1 foot wide and two assays yielded \$58 and \$76 respectively, in gold.

Trux Texas at Central shows good ore and a strong vein. The mill will have a capacity of seventy tons per day.—The Kansas City S. & R. Co. has sixty men employed and is shipping forty tons of ore per day from the

Othello and Desdemona mines at Cook's Peak. These mines have produced more than 12,000 tons of ore per year during the past three years.—J. M. DeKiersey is developing properties in the White Signal district. A trial lot of five tons from the Golden Dawn mine gave returns of \$32 per ton gold, \$6 per ton in silver and 5 per cent copper. On the Gold Dust mine, the same owner, the pay streak is from 6 to 18 inches in width and averages \$37 per ton.

The Philadelphia mine at Hanover made a strike last week of an ore body 7 feet wide that averages 26 per cent in copper.

OREGON.

The Eagle group of mines near Baker City, comprising twelve claims in a 500-foot tunnel, has a ledge from 2 1/4 to 4 feet wide that gives an average return of \$17 to the ton. There are 3000 feet of development work done.—The King Solomon mine will soon be a producer. Canadian capitalists have secured the ownership of the property and are making arrangements to put up a mill. A large force is employed at the mine.—Godfrey & Tabor, owners of the Red Boy mine, report their new mill completed and ready to begin work.

At the Baisely-Elkhorn mine near Baker City forty men are at work. The shaft is down 450 feet. The mill is crushing from thirty-five to forty tons of ore every day.—The Landry hydraulic mine near Baker City has closed for the season. Because of water shortage the mine had only a four months' run. The cleanup was considered good.—Some sixty men are working and drifting on Lower Powder river with good results owing to low water.

At Hull & Beck's quartz mine, near Jacksonville, the vein increases in width as work progresses; it is now several feet wide. A 5-stamp mill is crushing the ore taken out by six men.—J. R. Mitchell of Colorado, who represents foreign capital, has bonded the Braden and Alice mines in Kane's Creek district and the Lucky Bart and Gray Eagle in Sardinia Creek district. Development of some of the properties is proceeding.—The Jones Co. has twenty men developing its properties in Mt. Reuben district, Josephine county.—Near Ashland, Molander & Felger of Port Townsend have bought 160 acres of land on Evans creek, Josephine Co., having four claimable ledges which are reported running 8 per cent of quicksilver. One of the ledges is said to be 400 feet wide and 1 1/2 miles long.—L. D. Fay & Co. are getting their mine on Powell's creek fitted up for work this winter. They have 120 acres of placer ground and have their ditch almost completed and have pipe and giant ready for work.

Stith & Phillips have bonded the Free and Easy mine, near Grants Pass, to Bonneau & Mohr of Denver, Colo., for \$10,000.—At the Golden Standard mine, near Jacksonville, the mill will be put in operation as soon as water can be had. A large amount of good ore is ready for crushing.—Fifteen cars loaded with hydraulic pipe, ranging from 15 to 38 inches in diameter, are being put on the J. C. Lewis placer mine, near Leland.—The C. Cook mine at Glendale is down on the ledge 117 feet. He will put a mill on the property soon.—The Victory mine has the reservoir completed. Wood & Smith of the Lincoln mine are also building a reservoir.

UTAH.

Shipments from Tintic for last week were 147 cars of ore, 11 cars of concentrates and 19 bars of bullion.

In the South Swansea, in the 750-foot level, a 4-foot vein of galena has been opened that runs 50 per cent lead and over ninety ounces in silver.

The Swan-Bemis mill, at Bingham, at which operations were suspended three weeks ago to make a change in the elevator, last week started on ores from the Niagara M. Co.'s property.

Mercur Mercury: The Chloride Point, with the changes made in the mill, will handle 150 tons of ore per day. A departure is being made from the usual manner of treating zinc shavings, it being found that strips 1/2-inch wide work well in the settling boxes, better than the fine shavings, the zinc being entirely eaten up by the solution, and combining readily with the silver and gold. The cyanides carry a large percentage of silver, the last shipments being richer than some of the bullion brought from the smelters. As soon as the mine begins to run to its capacity of 150 tons per day, a clean-up will be made three times per week. An experiment has been made to see if a higher grade of ore can be successfully leached, and the result has been satisfactory. Some of the high grade ore was mixed with the low grade, and the leaching has been more successful than in the other cases.—The total output of the Ophir Hill mill for August was 1017 tons of concentrates.

The Herschel Co., after driving a tunnel 2200 feet, have decided to make a change in the method of exploration, and an upraise is being made at one point and a winze sunk in another.—The work inaugurated on the Omaha of West Dip continues with good results. The company has put down three shafts upon the strike of the vein, and in each of them it is said that milling values have been found.—The Mercur shipped 1000 pounds of auro-cyanides. The Annie, in Camp Floyd district, will resume work immediately. The shaft had reached 500 feet, and the ore values were \$5.50 when work ceased.

Mercur Miner: Machinery for La Cigale roaster will be ready for operation within a month. The roaster is of a daily capacity of 100 tons. Only a small portion of the ore will need roasting, as there is no arsenic or other base metal in it.—The Macintosh Sample, at Park City, last week shipped 1,798, 830 lbs. of ore.

Bingham Bulletin: A. J. Bettles is having a test run made at the Markham mill on 100 tons of ore from the Copper Center and Jubilee tunnels. It is liable to lead to important developments in connection with properties of the Boston Con. Co.—Smith & Walker are

starting work on the Yukon, an old claim under relocation at the mouth of Cottonwood.—Indications are that the September shipments will show a gratifying increase over those of August. The starting of the old Jordan and Dewey mills alone insures an increased output.—Good bodies of high grade ore have been opened up the past season in the east workings of the Old Telegraph mine. Some of the assays show 300 ounces silver.

WASHINGTON.

At Colville cleaning out the tunnel of the Old Dominion mine is progressing with three shifts. The length of the tunnel is 4000 feet. Opening the works will not be so difficult as at first anticipated. The Bonanza mine is shipping two carloads of first-class ore per day. The company is preparing to sink to the 500-foot level. When this is completed it will be necessary to put in a new hoisting plant.

The purchase of the Daisy group of claims on Troublesome creek by C. E. Haber, representing a German syndicate, promises to result in extensive mining industries in the Cascade mountains. He is employing fifty men, divided among four camps, and is driving long line tunnels, the main tunnel being 300 feet long. The principal ore so far found is a low grade arsenical iron. The several camps will be connected by a cable tramway.

FOREIGN.

AUSTRALIA.

There were forty-one tons of bismuth ore exported from the colony of New South Wales in 1887, the value being £490. This metal is found in the Glen Innes, Pambula and Nymagee districts, but the demand for it is limited; and the Queensland report states that no ore was raised from the antimony and bismuth mines.

BRITISH COLUMBIA.

In the White Bear, at Rossland, the shaft is down 230 feet. The ore body is 2 to 3 feet wide.—In the Alberta the whole face of the workings is in mineral, and of this about 2 1/2 feet is a good grade of quartz, mixed with arsenical iron and copper. Values range from \$8 to \$50.—At the War Eagle the shipments for August were heavier than during the previous month. The hoisting plant is raising the regular quota of 300 tons daily. No dead work is being carried on, with the exception of sinking the shaft, and toping and drifting continue to monopolize the force.

A Montreal company, in which Hosmer & Mackay are said to lead, has bought the Iron Horse mine at Rossland. The price is said to be \$100,000. The intention of the purchasers is to commence work immediately. It contains the two veins that are in the Virginia, which run through the entire length of the property, and are traceable by croppings. The plan of work has not been decided upon, but it is thought that a shaft will be sunk 300 feet and a drift run to tap the vein.—The Tom Payne Co. have put men to work on the Myrtle group at Ymir.—The Rio Grande Co. have found a 26-inch vein that runs \$26 in gold and silver per ton. The force has been doubled at the Le Roi and 225 men are working in the mine. There are twenty-one machine drills at work. The mine is shipping 350 tons of ore a day. Of this amount 200 tons will be raised from the mine, and the balance, 150 tons, will be taken from the dump, where an enormous tonnage has accumulated since shipments had been suspended.—The Douglas Pine claim, Shoal bay, has been sold to J. H. Adams for \$10,000. A recent strike shows a vein from 5 to 10 feet wide with assays running well in gold. Development work is to be begun at once.—In the strike of a new ore body last week in the White Bear at Rossland, at a depth of 235 feet, the average assay gotten was \$46 and the character of the ore is almost identical with that in the Le Roi at a depth of 350 feet.

LOWER CALIFORNIA.

It is locally reported that the Juarez placer mines, owned by Los Angeles men, and which have been worked by Chinamen and Indians for ten years past by dry washing the surface, without water nearer than three miles, will soon be supplied with water which has been developed by the aid of two pumping plants, one of which is six miles and the other three miles distant. A pipe line has been laid. Either of these pumping plants can furnish an ample supply of water to work the hydraulic and centrifugal pumps used for washing the gravel. It is expected that they will handle from 400 to 500 cubic yards of gravel every ten hours, which the most conservative say will average 75 cents per yard; and from assays made by experts, have shown as high as \$1.50 per cubic yard. The gold taken out is nearly pure, selling at \$20 per ounce. Wood for fuel is to be had in unlimited quantity at \$1 a cord, and labor is comparatively cheap, wages to Mexicans and Indians being \$1 50 a day, Mexican money, equal to about 75 cents of a gold dollar.

FOR SALE.—THE SHASTA CO. SAMPLING WORKS. A complete plant for the sampling of ores, gasoline engine, crusher, assay outfit, ore bins, etc., etc. Address O. H. S., this office.

NOTICE.

Parties having Mining or Milling Machinery for Sale or those wishing to purchase same on easy terms, please call at or address

ASSAY OFFICE, 10 Stevenson St., S. F.

MOTHER LODGE MINE FOR SALE. THREE CLAIMS UNDEVELOPED AND IN CLOSE proximity to several best paying mines of Tuolumne Co. Address OWNER, care Mining and Scientific Press.

Gold Mine for Sale.

Eight Claims on Mother Lode, Calaveras Co., Cal. Twenty-stamp mill building, and ten stamps. Some development work done years ago, including shaft 500 feet deep. Trustee offers at low price. For particulars address KNOX, care Mining and Scientific Press.

WANTED.

Partner in Extensive Placer and Quartz Mines. Free wood and water. JAMES ARTHUR, Cornucopia, Union Co., Oregon.

POSITION WANTED

By Superintendent of Mine and Mill.

Having twenty years' experience in assaying, mining and milling gold and silver ores, and bullion refining. Also familiar with the separation of gold from copper without acids, as practiced in Colorado. Have served four years as assayer in U.S. coinage mint. Address "Mine Supt." Mining and Scientific Press Office, San Francisco, Cal.

WANTED & &

GENERAL SUPERINTENDENT

Having experience and perfect knowledge of mining large bodies of ore, and familiar with square setting. Man now occupied in this position preferred. Prefer mining engineer having a knowledge of milling and machinery. Good salary, with chances of advancement. Address only in confidence LOCK BOX NO. 1252, SALT LAKE CITY, UTAH.

Mine and Mill Superintendent

Will be open for an engagement Oct. 1, '98.

Highest References Furnished.

Can also do Mine Surveying, Mapping and Assaying. Competent to take full charge of a gold or silver property anywhere.

As to terms, qualifications, etc., address F. G., Mining and Scientific Press Office, San Francisco.

Mine Wanted.

Man of experience will develop gold mine for 1/2 interest, or will bond whole property and develop. Must have ore chute IN SIGHT. State exact conditions. Correspondence with owners only. Address P. O. Box 887, Los Angeles, Cal.

WANTED.

METALLURGIST and PRACTICAL SMELTER

Will be open for engagement October 1st as Superintendent of Copper or Lead Smelting Works.

Thoroughly competent in analyzing, assaying, and handling men. Speaks Spanish. Excellent references. Address SMELTER, care Mining and Scientific Press.

COPPER MINES WANTED

—ALSO—

A Good Dividend = Paying Gold Mine.

Address "MINING ENGINEER," P. O. Box No. 1, ROSINDALE, MASS.

THE

UNION IRON WORKS,

222 Market Street, San Francisco, Cal.

MAKE THIS SMALL

DOUBLE CYLINDER SINGLE DRUM HOIST

HOIST FOR PROSPECTING.

For Prospecting Purposes
or Underground Work,

USING COMPRESSED AIR.

The entire hoist is self-contained, being mounted on an iron sole plate or bed which carries all the operating levers and provides a footboard for the operator. The engines are provided with reversible link motion and the drum with a broad strap brake, insuring safe and rapid work.

The general lines upon which this hoist is designed are neat, strong and substantial and all the operating parts are conveniently arranged.

The size herewith illustrated is the 4 in. x 10 in., rated at 15 horse power. The larger sizes, 8 in. x 12 in. and upwards are provided with post brakes.

"Union" Hoist.

The above cut represents our 10 h. p. Double Cylinder Engine of latest type, and Hoist combined on strong iron base. This hoist is designed to raise one ton 125 feet per minute from an inclined shaft, or 1500 pounds at the same speed vertical lift. The drum will hold over 600 feet of $\frac{1}{2}$ -inch cable. The outfit weighs 3500 pounds.

THE UNION GAS ENGINE CO.

— BUILD THE —

"Union" Gas Engines,

Which use either Manufactured or Natural Gas, Ordinary Stove Gasoline (Naphtha or Benzine), Distillate or Kerosene.

STATIONARY ENGINES for All Kinds of Work, Built in Sizes from 3 to 200 h. p.

"UNION" COMBINED HOISTS in Sizes from 2 to 40 h. p.

"UNION" COMBINED COMPRESSORS — 20, 30, 40 h. p.

HOISTS and COMPRESSORS Can Be Built in Larger Sizes to Order.

"UNION" MARINE ENGINES, 4 to 200 h. p., of Single, Double and Four-Cylinder Types.

TEN YEARS' EXPERIENCE Building Gas and Oil Engines.

"UNION" ENGINES Are in Use All Over the United States.

"UNION" ENGINES Are Simple, Durable and Economical.

A REVOLUTION IN FREIGHTING.

THESE WAGONS ARE ESPECIALLY ADAPTED FOR STEAM FREIGHTING; CAPACITY OF TRAIN 50 TONS.

"The Daniel Best" 50-Horse Power Traction Engine.

The most powerful and only Successful and Practicable Road Engine in the World. Over sixty of them in use in this State, and they are being Successfully and Profitably Employed in Hauling Logs Lumber, Ore, Salt, Borax and other kinds of freight. The work is being done **FIFTY PER CENT** Cheaper than it is possible to do with Animal Power. They can be operated over any ordinary road where it is practicable to use mules or horses, doing the same work. They can ascend or descend grades as much as 20 to 30 inches to the rod, hauling their loads of 35 to 40 tons, depending upon the condition of the roads; loads may be increased to even greater amount on moderately level roads. Send for descriptive Circulars and price List of Wagons and Engine. We solicit correspondence. No trouble to answer questions. Estimates made for complete Steam Freighting Outfits. Address

SPECIAL DEPARTMENT OF

Hydraulic Mining Machinery,

Comprising Hydraulic Gravel Elevators, Double-Jointed Ball-Bearing and Single-Jointed Giants, Sheet-Iron and Steel Water Pipe and Fittings, Water Gates, Etc.

NOTICE.—All other forms of Hydraulic Gravel Elevators are simply poor imitations in construction and infringements of the patents held by us. The Double-Jointed Ball-Bearing Giants recently perfected and patented by our MR. JOHN H. HENDY are incontestably superior to any other form of Giants yet introduced.

We are prepared to furnish plans and estimates of cost of any proposed Hydraulic Mining Plants upon any specifications submitted to us, and tender the services of our Hydraulic Mining Engineer to erect and place same in successful operation under guarantee.

THE JACKSON HAND POWER ROCK DRILL.

Rapid stroke. Powerful blow. Easy running. No jar. Long bits changed and hole spooned without dissembling machine. Operated by one man. A guaranteed drill. Will work in any rock or position.

Dealers in General Mining Machinery and Supplies. THE JACKSON DRILL AND MFG CO., DENVER, COLO.

PATENTS

DEWEY, STRONG & CO'S PATENT AGENCY.

Our U. S. and Foreign Patent Agency presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American reports, with full copies of U. S. Patents since 1872. All worthy inventions patented through DEWEY, STRONG & CO.'s Patent Agency will have the benefit of a description in the *Mining and Scientific Press*. We transact every branch of patent business, and obtain patents in all countries which grant protection to inventors. The large majority of U. S. and foreign patents issued to inventors on the Pacific Coast have been obtained through our agency. We can give the best and most reliable advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and circulars free.

MARSH STEAM PUMPS.

SINKING AND STATION PUMPS
For Mines.
BOILER FEEDERS,
Deep Well, Tank and Vacuum Pumps.

The MARSH SINKING PUMPS are Superior in the Following Points:

- First—Compactness.
- Second—Strength of parts.
- Third—Fast speed, quiet action.
- Fourth—No throttle valve necessary in exhaust pipe.
- Fifth—Steam valve self-governing: will not race or pound if water gives out with steam valve wide open.
- Sixth—All moving parts can be covered and protected from falling dirt.
- Seventh—No packed joint between chamber and pump to give out and need renewing.
- Eighth—Exhaust can be turned into suction.
- Ninth—All parts easily accessible and fewer than in any other pump.

VULCAN ROPEWAY

— WITH —
**AUTOMATIC ORE LOADER AND
AUTOMATIC DUMPING DEVICE.**

For Conveying
Ore, Cordwood,
Etc.

EMPIRE, NEVADA, April 17, 1896.
Vulcan Iron Works.—GENTLEMEN: The Ropeway furnished by your company to convey tailings from Morgan Mill to Mexican Mill, a distance of seven-eighths of a mile, is giving entire satisfaction. We transport 200 tons of tailings in ten hours; one man does the whole business, including elevating tailings from hopper in the ground, operating Vulcan self-loader, and attending to the Ropeway generally. The self-dumper requires no attention whatever. The Vulcan loader I consider the best feature in the whole Ropeway, making it possible for one man to load 200 tons in ten hours.
Yours very truly,
J. P. WOODBURY, Supt.

Market Reports.

The Markets.

SAN FRANCISCO, Sept. 15, 1898.
SILVER.—London, 28d; New York, 60%; San Francisco, 60%; Mexican Dollars, 46% @ 46%.

COPPER.—Electrolytic, 12½¢; Casting, 11½¢; Lake, \$12.25 @ 12.37½. Boston prophecies 14¢ for copper "before the snow flies." The closing down of a part of the Anaconda, Butte, mine is one of the reasons assigned. New York advices to-day report "business sluggish." A Boston financial paper of the 10th inst. says: "The future of the copper market, aside from the supply and demand, and aluminum competition, is in the hands of the Rothschilds, the Lewisohns and the lake people, and it is Arizona, and not Montana, that will control the future price of copper."

Under date of Sept. 1st, James Lewis & Son, 5 Fenwick St., Liverpool, England, report: Gold, 77s 10½d per ounce standard; silver rose from 27½d to 27 13-16d on the 23rd ult., and closes at 27 11-16d for prompt and 27½d for forward delivery; quicksilver from second hands is quoted at £7 12s per bottle; sulphate of copper is more inquired for and sales for forward delivery have been made at £17 per ton; lead is dull at £12 17s 6d per ton for English; soft Spanish, £12 16s 3d; ore of 70 per cent, about £26 per ton and fine silver value; antimony, firm at £36 10s to £37 per ton; nickel, quoted at 1s 1d to 1s 2d per pound net; tin advanced from £71 5s to £75 on the 16th ult., but has since receded to £72 per ton.

LEAD.—New York reports "quiet, with \$4 bid and \$4.05 asked. The firm fixing the settling price for miners and smelters quotes lead \$3.85." Local, pipe, 6 @ 6½¢; sheet, 6½ @ 7¢; pig, 5½¢; bar, 6¢.

IRON.—American, soft, \$20 and \$22 per ton; Scotch, \$23.

SPELTER.—Unchanged, 5½ @ 5½¢. TIN.—Menlo Roofing, redipped, 7¢; English, to arrive, \$4.50; Pig, 18¢; Bar, 19¢.

ANTIMONY.—92½, 10.

BABBIT METAL.—10-12-14—best 16¢.

QUICKSILVER.—Firm and unchanged, domestic \$42.50; export \$38; carload lots, special rates.

POWDER.—F. O. B., San Francisco: No. 1, 70% nitro-glycerine, per lb., in carload lots, 15½¢; less than one ton, 17½¢. No. 1* 60%, carload lots, 13½¢; less than one ton, 15½¢. No. 1** 50%, carload lots, 11½¢; less than one ton, 13½¢. No. 2, 40%, carload lots, 10¢; less than one ton, 12¢. No. 2* 35%, carload lots, 9½¢; less than one ton, 11½¢. No. 2** 30%, carload lots, 9¢; less than one ton, 11¢. No. 3 Black blasting powder in carload lots, minimum car 725 kegs, \$1.50 per keg; less car lots, \$2 per keg.

FUSE.—Triple tape, \$5.10 per 1000 feet; double tape, \$4.35; single tape, \$3.45; Hemp, \$3; Cement No. 2, \$4.35; Cement No. 1, \$3.45.

CAPS.—3x, \$5.50 per 1000; 4x, \$6.50; 5x, \$8; Lion, \$9.

COAL.—San Francisco coast, yard prices: Wellington.....\$8 00 Coos Bay.....\$5 00 Seattle.....6 00 Southfield.....7 50

Coke.—Foreign, \$13; domestic, \$12 per ton.

OILS.—California Castor, pure, cs., \$1.12 per gal.; bbl., \$1.07; pure No. 2, cs., 85¢; bbl., 80¢; Baker's AA Castor Oil, in case lots of 200 gals. and upward, \$1.11; less than 200 gals., \$1.20; in bbls., 4¢ per gal. less than case; Baker's Crystal, \$1.50; China Nut, 52¢; Linseed, strictly pure, boiled, bbl., 43¢; es., 43¢; raw, bbl., 41¢; cs., 46¢; lots of 5 bbls., 1¢ less; Lucol, boiled, bbl., 38¢; cs., 43¢; raw, bbl., 36¢; cs., 41¢; lots of 5 bbls., 1¢ less. Kerosene—Pearl, cs., per gal., 17¢; Astral, 17¢; Star, 17¢; Eocene, 19¢; Extra Star, 21¢; Elaine, 22¢; Water White, bulk, in tanks, 11½¢; Mineral Seal, iron bbls., 21¢; wooden bbls., 23½¢; cs., 26¢; Mineral Sperm, 27¢; Deodorized Stove Gasoline, bulk, 12½¢; do., cs., 18¢; 86 deg. Gasoline, bulk, 20¢; do., cs., 25¢; 63 deg. Naphtha or Benzine, deodorized, in bulk, per gal., 11½¢; do., in cs., 16½¢; Lard Oil, Extra Winter Strained, bbl., 56¢; cs., 61¢; No. 1 bbl., 46¢; cs., 51¢; Neatsfoot Oil, bbl., 65¢; cs., 70¢; No. 1 bbl., 55¢; cs., 60¢; Sperm, crude, 60¢; Natural White, 65¢; Bleached do., 70¢; Whale Oil, Natural White, 40¢; Bleached do., 45¢; Cocoa, cs., 55¢; Pacific Rubber Mixed Paints, white and house colors, \$1.25 @ 1.35 per gal.; wagon colors, \$2 @ 2.25.

CHEMICALS.—Cyanide of potassium, jobbing, 29 @ 30¢ per lb.; carloads, 27¢; sulphuric acid, 2½¢ per lb. for 60%; soda ash, \$1.60 per 100 lbs. 58%; hyposulphite of soda, 2½¢ per lb.; blue vitriol, 4½¢ per lb.; borax, refined, 5 @ 6¢ per lb.; chlorate of potash, 9½ @ 10¢; roll sulphur, 2½¢; blue vitriol, 4¢; alum, \$1.90 @ 2.00; flour sulphur, French, 2½ @ 2½¢; California refined, 1½ @

1½¢; nitric acid, 12½ @ 16¢; caustic soda, 60%, 2½ @ 3½¢; 70%, 3½ @ 4½¢; 77%, 3½ @ 4½¢; Cal. s. soda, bbls., 65¢; sds., 60¢ @ 100 lbs.; chloride of lime, spot, 2.10 @ 2.25¢; to arrive, 2.10 @ 2.25¢; saltpeter, refined, 9¢; chlorate of potash, 9½ @ 10¢; caustic potash, 8 @ 9¢.

CORDAGE.—Net rates on not less than 10,000 lbs., subject to change without notice.

Sisal, Manila.
1½-in. cir. (7-16 dia. and upward).....93¢ 103¢
12-thread (¾ dia.).....104 114
6 and 9 thread (¾ and 5-16 dia.).....104 114
Bale Rope (3 and 4 strand).....93 103
Bale Rope (2, 6 and 8 strand).....104 114

Yesterday the Tubbs Cordage Co. of San Francisco issued a new price list, quoting invoices of 10,000 pounds as follows: Manila Rope, 10½¢; Sisal Rope, 9½¢; Duplex Rope, 8½¢.

CANDLES.—Electric Light Candles—6s, 16 oz., 7½¢; 6s, 14 oz., 6½¢; 6s, 12 oz., 5½¢; 6s, 10 oz., 4½¢; Granite (Mining) Candles—6s, 16 oz., 8½¢; 6s, 14 oz., 7½¢; 6s, 12 oz., 7½¢; 6s, 10 oz., 6½¢. Paraffine Wax Candles—1s, 2s, 4s, 6, 12s, white, 8¢; colored, 9¢.

LUMBER.—Retail: Pine, ordinary sizes, \$17 @ 18.50; redwood, No. 1, \$18 @ 20; No. 2, \$16 @ 18.

Mining Share Market.

SAN FRANCISCO, September 15, 1898.
The prompt and affirmative action of the committee of Comstock superintendents to whom was delegated the duty of compiling data and making recommendations regarding the feasibility of drainage of the Comstock, and resumption of deep mining thereon, resulted this week in a material advance in the price of stocks and the volume of business thereon, is an index of future movement, if the recommendations on page 287 can be carried to a successful conclusion.

To Our Customers and Friends on the Pacific Coast:

Through frequent complaints made to us, we have learned that unprincipled and dishonest dealers on the Pacific coast have counterfeited our trademark numbers and substituted inferior, spurious goods as ours, when ours were distinctly ordered, thus defrauding the customers and injuring our trade and reputation.

Our goods are acknowledged to be the best, and are fully warranted by us, and are marked with our name or initials or with our well-known trademark and catalogue numbers.

We request direct notice if any goods alleged to come from us, or bearing our trademark or numbers, prove to be other than the best, and perfect in every respect, as we will follow up and expose such frauds for our customers' and our own protection. We have no exclusive agents on the Coast, but our goods are obtainable from all respectable dealers in drawing materials, stationery, hardware, artists' material, etc. Respectfully,

KEUFFEL &

ESSER CO.,

127 FULTON ST.

New York.

Assessment Notices.

CONSOLIDATED ST. GOTHARD MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Nevada County, California.
Notice is hereby given, that at a meeting of the Board of Directors, held on the 11th day of August, 1898, an assessment (No. 1) of 10 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 113 Crocker building, sixth floor, San Francisco, California.
Any stock upon which this assessment shall remain unpaid on the 26th day of September, 1898, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on WEDNESDAY, the 12th day of October, 1898, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.
By order of the Board of Directors,
J. F. HOLLING, Secretary.
Office—113 Crocker building, sixth floor, San Francisco, California.

NATIONAL CONS. MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Rich Gulch, Shasta County, California.
Notice is hereby given, that at a meeting of the Board of Directors, held on the 22nd day of August, 1898, an assessment (No. 4) of ten (10) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 916 Market street, Room 57, San Francisco, California.
Any stock upon which this assessment shall remain unpaid on the 3rd day of October, 1898, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 31st day of October, 1898, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.
By order of the Board of Directors,
GEO. W. FLEISSNER, Secretary.
Office—No. 916 Market street, Room 57, San Francisco, California.

EUREKA CONSOLIDATED DRIFT MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Forest Hill, Placer County, California.
Notice is hereby given, that at a meeting of the Board of Directors, held on the 12th day of September, 1898, an assessment (No. 13) of one-half cent per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, Nos. 1209 11th Claus Spreckels building, San Francisco, California.
Any stock upon which this assessment shall remain unpaid on the 15th day of October, 1898, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on TUESDAY, the 1st day of November, 1898, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.
By order of the Board of Directors,
J. J. CRAWFORD, Secretary.
Office—Nos. 1209-11th Claus Spreckels building, San Francisco, California.

LEON GOLD MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, near Winchester, Riverside County, California.
Notice is hereby given, that at a meeting of the Board of Directors, held on the 16th day of May, 1898, an assessment (No. 1) of 1/4 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, Room 7, fifth floor, Mills building, San Francisco, California.
Any stock upon which this assessment shall remain unpaid on the 25th day of June, 1898, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 25th day of July, 1898, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.
By order of the Board of Directors,
R. L. CHENEY, Secretary.
Office—Room 7, fifth floor, Mills building, San Francisco, California.

POSTPONEMENT.
By order of the Board of Directors of the Leon Gold Mining Co., the day of delinquency of the above assessment is postponed to July 9th, 1898, and the day of sale to MONDAY, August 31st, 1898.
R. L. CHENEY, Secretary.
Office—Room 7, fifth floor, Mills building, San Francisco, California.

POSTPONEMENT.
By order of the Board of Directors of the Leon Gold Mining Co., the day of delinquency of the above assessment has been postponed to September 3rd, 1898, and the day of sale to MONDAY, October 3rd, 1898.
R. L. CHENEY, Secretary.
Office—Room 508, Safe Deposit building, Cor. California and Montgomery streets, San Francisco, Cal.

POSTPONEMENT.
By order of the Board of Directors of the Leon Gold Mining Co., the day of delinquency of the above assessment has been postponed to September 3rd, 1898, and the day of sale to MONDAY, October 3rd, 1898.

ROPP STRAIGHT LINE FURNACE

FOR ROASTING, CHLORINATING AND DESULPHURIZING ORES.

Extracts from Letters Received from Mr. Philip Argall, Manager the Metallic Extraction Co., Cyanide, Colorado:

January 2, 1897.

"The roasting is invariably good. We can do 80 tons per day to 0.13% sulphur, when everything runs smooth. Our month record which, of course, includes all delays, is 1700 tons, from 1.94% sulphur to 0.16%."

February 19, 1897.

"Our furnace is now running very nicely indeed, averaging 90 tons per day to 0.10% sulphur, and doing excellent work; in fact, it has improved right along and we are highly pleased with it."

"For 24 hours ending 7 A. M. to-day 102 tons were roasted."

The ROPP FURNACE is now in successful operation at the following reduction works: The Hanauer Smelting Works, Salt Lake City, Utah (one furnace); The Metallic Extraction Co., Cyanide Colo. (one furnace); The Colorado-Philadelphia Reduction Co., Colorado City, Colo. (three furnaces); The Selby Smelting & Lead Co., Selby, Cal. (two furnaces); The Mount Morgan Gold Mining Co., Rockhampton, Queensland (one furnace); Broken Hill Proprietary Co., Broken Hill, New South Wales (four furnaces); Puget Sound Reduction Co., Everett, Washington; Colorado Ore Sampling & Reduction Co., Cripple Creek, Colo.; Consolidated Kansas City Smelting & Refining Co., for the Arkansas Valley Smelting Works, Leadville, Colo.; Robert Lanyon's Son's Spelter Co., Iola, Kansas (two furnaces); Mountain Copper Co., Ltd., Keswick, Cal.

AND PACIFIC ELECTRICAL REVIEW.

No. 1994.—VOLUME LXXVII.
Number 13.

SAN FRANCISCO, SATURDAY, SEPTEMBER 24, 1898.

THREE DOLLARS PER ANNUM.
Single Copies, Ten Cents.

Latest in Electrical Transmission.

The most recent application of electricity to the steam railroad, superseding, with faster schedule, the steam locomotive and steam schedule, was made August 15th on the Buffalo & Lockport Railway, a branch line of the Erie Railroad from Tonawanda to Lockport. The total length of the tracks owned or leased by the company is twenty-nine miles. Work was commenced May 17, 1898, and at midnight Au-

INTERIOR SUBSTATION, LOCKPORT, SHOWING
AIR BLAST TRANSFORMERS, ROTARY
CONVERTERS AND SWITCHBOARD.

gust 14th the steam service was suspended. Nothing has since occurred to mar the perfect and punctual operation of the road on the new schedule. Power is obtained from the Niagara Falls Power Co. by tapping its long-distance transmission line between Buffalo and Niagara Falls. It is carried at a pressure of 10,500 volts alternating current over bare copper wires to the rotary converter substation at the Lockport terminal of the Erie branch, there led into six 150 K.W. static transformers of the air-blast type, in which the pressure is reduced to 350 volts. At this pressure the current passes to two rotary converters, where it is converted into continuous current at 500 volts. The rotary converters

are standard General Electric six-pole, 400 K.W., 500 revolution machines.

The switches for the high tension current are of the quick-break type, each blade being separated from its next neighbor by a marble barrier. The blades are pulled open by means of a hooked stick, the hook being inserted into an eye let into the end of the blade. The fuses on the high potential circuits are of the expulsion type, in which the fuse is held between two springs, so that at the moment of fusing the two ends, between which the arc would ordinarily spring, are instantaneously pulled apart. Each of the direct current panels is equipped with a "K" automatic circuit breaker. The line is protected by General Electric lightning arresters of the short gap type, so successfully employed in local high-voltage, as well as on the Niagara transmission circuits. As soon as their present plant is completed another rotary converter substation will be erected at Tonawanda, taking current also from Niagara Falls.

From the starting point in Buffalo to the city limits the cars are operated by current from the Buffalo Railway Co.'s station. The new converter substation at Tonawanda will feed seven miles to Lockport and half way in the direction of Niagara Falls, the converter at Niagara Falls feeding half way back to Tonawanda. The arrangement will be such that the Buffalo & Lockport Railway system can give current to or take it from the Buffalo & Niagara Falls Electric Railway. The Lockport converter station will then feed back seven miles to Lockport, and supply current also to the city lines in Lockport itself.

The new rolling stock consists of two 36-ton electric locomotives, supplied by the General Electric Co., for freight service, and ten electric motor cars mounted on eight wheels.

The theory of handling the passenger service has been entirely changed from that in force with steam traction. Instead of long intervals between trains, the cars are run on half-hour headway. This requires five cars to operate the twenty-five miles between Lockport and Buffalo. The speed is high. Over their own right of way the cars ran on their first trip at the rate of fifty miles per hour, including stops. The running time from Lockport to Tonawanda is twenty-six minutes; to Buffalo, one hour and fifteen minutes. In this trip thirty-three minutes are spent in the city of Buffalo in a distance

END VIEW OF LOCOMOTIVE UNDER TEST AT
SCHENECTADY.

of six miles, where the speed has to be kept low to conform to city ordinances. Even with this drawback, however, it is expected that soon the running time between Buffalo and Lockport will be reduced to one hour.

The passenger and combination cars are 31 feet 8 inches long over the end panels, and, with platforms 4 feet 6 inches long, measure 42 feet 4 inches over the buffers. These cars are run on T rails at a speed that will enable them to average forty-five or fifty miles per hour. Electric brakes are provided upon each axle, the discs being cast upon the wheels themselves.

The baggage and passenger combination cars are 31 feet 8 inches long over the end panels, 7 feet 8 inches wide at sills, and 8 feet wide at the widest point. The platforms are 4 feet 6 inches long. The total length over the angle iron buffers is 37 feet 10 inches. Each car is equipped with four General Electric 57 (52 H. P.) motors and B8 controllers. The weight of each car loaded is from twenty to twenty-five tons.

The two locomotives have been built for the purpose of handling the freight business of the road exclusively. The road being a feeder to the main Erie system, the traffic is considerable. To haul it, therefore, powerful locomotives were necessary, and in them the General Electric Co. has incorporated such improvements as the actual operation of its locomotives on the Baltimore & Ohio Railroad, the New York, New Haven & Hartford Railroad and Hoboken Shore road has dictated. The design follows closely that of the locomotives just mentioned, two sloping shields being placed one on each side of a central cab, the whole carried on two swiveled trucks. The cab frame is made of 1½ x 1½-inch angles, covered with a sheathing of ½-inch iron. The

ILLUSTRATIONS.—Interior Substation, Lockport, Showing Air Blast Transformers, Rotary Converters and Switchboard; End View of Locomotive Under Test at Schenectady; Locomotive and Train at Lockport, 301. Two-Stamp Mill of New Design, 305.
EDITORIAL.—Latest in Electrical Transmission, 301. Copper Apparently to Fall in Price; Another Decision of Ruling; Claim Presented by Fresno County Recorder; Extensive Circulation Sometimes Has Disadvantages; Unusual Drouth in California; Assessment Work on Unpatented Mining Locations, 302.
MINING SUMMARY.—From the Various Counties of California, Nevada and Other Pacific Coast States and Territories, 309-311.
THE MARKETS.—The Local Markets; Mining Share Market; Sales in San Francisco Stock Board, 322.
MISCELLANEOUS.—Concentrates, 303. Mining and Mill Practice in Arizona; Why Sandstone Was Used; Gasoline Engine at an Arizona Mine; Zinc-Lead Ores in Colorado; British Investors and California Mines, 304. Two-Stamp and Three-Stamp Mills; Floating California Mines in England; Grade of Plates in a Gold Mill, 305. Tabulated Results of Mill Work; Killed by the Fumes; A Short Account of the Cyanide Process in New Zealand; An Electric Foundry; A Regular Cycle; Much of the Land Surface of the Globe Still Unexplored; Tapping the Nile; Electrolysis in Making White Lead, 306. The Gas Engine; Coast Industrial Notes; Personal; List of U. S. Patents for Pacific Coast Inventors; Recently Declared Mining Dividends; Recent California Mining Incorporations; Catalogues, Etc.; Commercial Paragraphs; Obituary, 307. Is Darwinism True? Platinum in the Ural Mountains, Russia; Correcting Their Imperfect Records; Electric Smelting; The Fatal Blue Point in Working Iron or Steel; The Greatest Producers; Chemical Experiments in Relation to Heat; Traveling by Tunnel to Mont Blanc; New Gases in the Atmosphere; Calcium Described as a Yellow Metal, 308.

platform or main frame is built up of 8-inch channels, running the entire length of the platform and securely riveted to cross plates at the ends directly over the center truck bearings. Heavy oak buffer beams, to which are attached drawheads and pilots, are secured to the ends of the platforms.

The locomotives are equipped with pneumatically controlled trolleys. With this arrangement it is no longer necessary for the engineer or helper to leave the cab to replace the wheel on the wire or reverse the trolley. This is effected by a handle conveniently placed over the engineer's head. The downward motion is obtained by admission of air to a cylinder, the piston of which in moving compresses the spring holding the pole in place when running. The upward motion is accomplished by the spring and the movement sideways by hand, both pole and handle being on a swivel plate. The end view of the locomotive was taken while it was being tested at Schenectady. Here, for convenience, the current was taken from a third rail, and this explains the absence of a trolley pole.

The transformation of this line from steam to an electrically operated road marks an important step in the employment of current on the steam road. If in its operation it successfully attains the results expected, it will conclusively prove that electricity can be economically applied to the operation of branches and feeders of steam trunk line systems. It would be too much to expect an immediate conversion of these latter main lines from steam operation to operation by electricity, but with electric locomotives and motor cars profitably carrying on both freight and passenger traffic on their feeders, the entering wedge will be driven still further and the ultimate result will be so much nearer of attainment.

THE unusual drouth in California will seriously affect the aggregate gold yield of that State for '98. Not for a generation has there been such a scarcity of water in every part of the State. In probably no other section of the country is annual mountain and foothill rainfall so necessary by reason of the nature of the country, the California miner in many parts of the State depending on the ditch system. There are comparatively few springs, the bedrock being so often slate with vertical cleavages, through which the water readily percolates, that the streams depend upon mountain snowfall, and when that is lacking they are very low early in the season. Upon the ditch system depend largely the quartz and hydraulic mines; and when, as in the present year, the ditches are unable to furnish the usual water supply, the result, in many instances, is a general cessation of work with a corresponding decrease in the gold output.

Assessment Work on Unpatented Mining Locations.

As is usual at this season of the year, comes a multitude of inquiries regarding annual assessment work. It is customary to answer many questions with what is usually a sufficiently accurate reply in two or three lines in "Concentrates," it being of little general value to publish a column of questions all practically asking the same thing.

During this week thirty-seven questions on one point have been received. They can all be answered by citing Section 2324 of the U. S. Statutes, as amended Jan. 22, 1880, as follows: "Provided, that the period within which the work required to be done annually on all unpatented mining claims shall commence on the first day of January succeeding the date of location of such claim."

So that, in the case of a mining claim located any time after Jan. 1st, '98, the locator or locators have till Dec. 31st, '99, to do the \$100 worth of work required by the above federal statute. So far as California is concerned, holders of mining claims must remember that, in addition to the \$100 in work or improvements required by the U. S. Government, a State mining law which went into effect May 26, '97, makes it mandatory that on all lode locations after that date \$50 worth of work must be done within sixty days after posting the preliminary notice, and in the case of placer claims \$10 worth of work must be done on each twenty acres of placer ground within sixty days after location. This in the case of either lode or placer claims is not to be counted and will not be allowed as part of the required federal assessment work.

From Halleck, San Bernardino Co., Cal., comes what is practically the same question as asked by the other 36, with the exception that it asks, in addition: "Is there any way in which the \$50 already expended in compliance with the State law can be applied to the \$100 in work required by the U. S. law?"

The close of the preceding paragraph answers that question "No;" but it must be qualified, as there are possible cases where "Yes" might be a correct answer. In this State, where a mining claim is located, say, Nov. 20th, '98, it would be possible to do the required \$50 worth of work after Jan. 1st, '99, within sixty days after location, thus complying with the California law, and, at the same time, making that a part of the required annual assessment work specified by the U. S. statute.

Relative to points raised in some of the letters to which this is a general answer: Colorado has a State law that requires that a 10-foot shaft or tunnel must be dug at the point of discovery, to show by such work a lode or deposit of mineral in place, to complete the location; Nevada has a similar State statute; Utah has a law the same as the California statute cited, except that it gives ninety days instead of sixty, which is better. Sixty days are not enough, and that law has created considerable dissatisfaction, as there are many sections of California where compliance with that law is a hardship on the miner and prospector. The object of the framers of the California law was to compel development and prevent holding claims without work, but its practical working is not satisfactory.

THE Secretary of the Interior has made another decision or ruling of interest to miners. On April 16, '98, in the case of McFadden vs. M. V. M. & M. Co., State of Washington, plaintiff filed an adverse claim in the local land office, which was rejected for reasons (1) that it was not evidenced in manner prescribed by the rules of the department; (2) plat of adverse claim was not made by a deputy United States mineral surveyor; (3) no showing as to value and ownership of labor and improvements upon the claims as required by the rules of the department. These objections were sustained by the commissioner of the general land office. The Secretary of the Interior overrules this decision and holds that the adverse as presented at the local land office by McFadden was sufficient and that it was not necessary for a deputy United States mineral surveyor to make survey and plat which was filed with the adverse. The Secretary follows the decision in the case of Anchor et al. vs. Howe et al., 50th Federal Reporter,

366. The Secretary further holds that rules made by the commissioner of the general land office cannot be binding when said rules exceed the scope of the law, therefore the rule requiring that a deputy United States mineral surveyor shall make the plat and survey for an adverse claim is not binding and does not have the force and effect of law.

"WHAT is the chief present need of the mining world?" is asked. 'Tis a difficult question to answer, but a most suggestive topic, and one that can not be compressed into ordinary limits. Even assuming that the questioner means to ask what is of most present practical demand in daily duty, the field of answer is a broad one. Narrowing the scope of the query still more, and viewing but one little section of the domain of gold quartz mining, comes to the mind a swarm of suggestions as viewed from different standpoints. Probably were the question asked quartz miners as they came from work they would answer, "Something to make our work easier;" a foreman, manager or superintendent might say, "Something to make it cheaper;" an owner, "Less legal entanglements and more direct results for outlay." The problem of quartz mining is often a costly one to successfully solve. The miner has to contend with hard rock, water, soft ground, timbers and air. In many instances the first is the greatest obstacle. "Something to break rock easy" would probably be the prayer of many a worker. There is something defiant in the face of a hard rock drift that makes miners feel how small and weak are their efforts, and few things are more discouraging than to pound on a drill in hard rock. In the same line something that would better solve the water problem would be a boon to the working miner, this in particular as allied to deep mining. This is meant to be merely indicative of the vastness of the subject and the manifest impossibility of an answer that could more than touch the smallest segment of so mighty a circle.

WHETHER from a desire to influence the market, or other cause, there is a present Eastern attempt to make it appear that copper is about to fall in price. It is claimed that new discoveries and improved processes will soon make copper worth less than it is now: that presently, the increased output will soon reach an enormous annual total. While that part of the statement is true, it cannot be inferred that copper will decline in price, nor that copper properties will be less valuable. It must be borne in mind that the demand is also "enormous," and shows signs of being greater than at present. The claim is also made that aluminum is fast superseding copper, and that it can be commercially substituted therefor. This is also unlikely. The possible output and price of aluminum preclude probability of its entering into competition with copper to any great extent. It is true that for some purposes aluminum is preferable to copper, but the cost of the lighter material will constantly militate against its economic superiority.

THE Fresno Co., Cal., recorder has presented to the board of county supervisors a claim for \$1056.88, the amount of fees collected for recording mining claims. The money had been paid into the county treasury by the recorder, who now insists that he made a mistake in turning it over to the county, and seeks reimbursement. He claims that under the law he is entitled to the money so collected, and cites in support of his contention a decision of the Supreme Court in a Riverside, Cal., case. The recorder of that county had retained the money so collected and the county sued for its recovery. The court held that the official was entitled to it.

EXTENSIVE circulation of a mining journal sometimes has its disadvantages. An Arizona mining engineer, writing of a method of handling ore, says: "I want to write a technical article on this subject, but your paper has so many readers in this section that publication of the contemplated article might interfere with proposed transfer of the property." Apparently, there are three solutions of the problem of publishing that article—to sell the property, to transpose the location, or to stop having so many Arizona people read the paper—though that last would probably be the most difficult of the three.

Concentrates.

SMARTSVILLE, Cal., will be lighted with electricity.
The Trade Dollar mine at Silver City, Idaho, is said to be paying \$50,000 a month.
The Porterville, Cal., Development Co. will buy a 75 H. P. engine for its pumping plant.
The Cariboo Con. mine, Cariboo, B. C., in the six weeks of its spring run took out \$87,000.

ENSENADA, Lower California, last week shipped \$2000 in gold bullion to San Diego, Cal.

The Portland mine, Cripple Creek, Colo., has yielded a net profit in six years of \$3,000,000.

It is estimated that within five miles of Sandoz, B. C., 1000 men are employed at mining.

Mill sites are not mineral entries. The land so entered must be shown to be non-mineral.

The Hamilton mine and mill in Summit Co., Colo., have not suspended work one day in three years.

The Tharsis copper mine, Spain, has paid over \$6,000,000 in dividends during the past eighteen years.

The Boston & Montana mine of Butte, Mont., is designated as the Calumet & Hecla of the Butte camp.

A TEN H. P. gasoline engine in the Sonora, Cal., water works raises 400 gallons of water per minute.

To correct "knots" to geographical miles, multiply by 1.15. Twenty "knots" equals twenty-three miles.

The El Dorado County, Cal., Miners' Association holds its annual meeting at Placerville, to-day, Sept. 24th.

POLYBANITE is a metallic, iron-black silver sulfantimonite, Ag_2SbS_4 , crystallizing in the orthorhombic system.

From the safe of the Golden Cache mine, Lillooet, B. C., on the 18th inst., were stolen 800 ozs. amalgam, locally valued at \$8000.

In the Morning Star mine, Boulder Co., Colo., three lessees cleaned up in four months \$9000 net, after paying 30 per cent royalty.

In the Smuggler-Union mine of San Miguel county, Colo., there are said to be twenty-seven miles of underground workings.

The Mollie Gibson mine at Aspen, Colo., is putting in an electric plant and an underground trolley line to haul its ores to the shaft.

The Anaconda Mining Co. of Montana, has bought the plant of the Blackfoot Milling Co., at Banner, the largest concern in the State.

The Canadian Smelting Works at Trail, B. C., employs 400 men and has a monthly payroll of \$30,000. It has a capacity of 700 tons a day.

The Eagle-Shawmut M. Co. of Jacksonville, Cal., has donated \$1600 for the erection of a school building for their employees' families.

At Volcanoville, El Dorado Co., Cal., forest fires have destroyed the mill on the Josephine mine and the sawmill of the Channel Bend M. Co.

In a crevice in the Morning Star mine at Iowa Hill, Cal., were found last week nuggets worth from \$10 to \$400; a total of \$1500 was taken out.

The Highland Boy M. Co., at Bingham, Utah, will build a tramway from the mine to the Denver & Rio Grande railway, a distance of 12,700 feet.

A LOCATOR of a mining claim may abandon a portion of his original location without forfeiting any rights he may have to the remainder of the claim.

J. J. AND J. F. NEARY, splitting a round of twelve holes in the Green Mountain mine at Butte, Montana, last week, were killed by a premature blast.

In Butte, Mont., it is stated that it takes 200 tons of Butte & Boston rock to get the same result as is obtained from 100 tons of the Boston & Montana ore.

The smiths who sharpen the drills in the iron mines of Grangesberg, Sweden, are paid not by the number sharpened, but by the number of meters bored.

In the iron mines of Grangesberg, Sweden, the amount of rock broken for every pound of dynamite used averages 5½ tons, each ton representing 12 feet bored.

TO GUARD against the smoke settling around the works the United Verde Copper Co. at Jerome, Ariz., is building a stack 25 feet wide at the base and 155 feet high.

THE Russian Government has issued a decree for the removal of all duty on mining machinery during the next ten years into the Ural and Siberian provinces.

At Smartsville, Yuba Co., Cal., thirty years ago, it was not uncommon for a gravel mining company there to have three tons of quicksilver in the sluice at one time.

At Minas Prietas, the mining camp of Sonora, Mexico, the recently completed reservoir, holding 34,000,000 gallons, is full to overflowing, ensuring a water supply for a year.

It is locally reported that the De Lamar, Nev., Company will change the process of working the ore from a dry-crushing to a wet one. About 500 men are at work there.

The Sierra Railway Co. has let a contract for the extension of their road from Jamestown to Sonora, Cal., and say they will have trains running to the latter place by Jan. 1st, '99.

CERANGYRITE is a resinous, variously colored silver chloride, $AgCl$, crystallizing in the isometric system; horn silver. It occurs massive or crystallized, is colorless, when perfectly pure, to brown, and is easily cut.

MINE INSPECTOR BYRNES of Butte, Montana, says that some miners estimate that a fuse will burn one foot a minute, but that this theory is wrong. He maintains that the standard of a foot of fuse is only thirty seconds.

AFTER an adverse claim has been filed, and suit begun, no relinquishment or other abandonment of suit will be accepted by the U. S. Land Office or Interior Department. It must be a fight to a finish so far as legal forms are concerned.

THERE is no limit to the number of mining claims any person or corporation can take up, but there is usually a limit to the number that can be held, being ordinarily determined by financial ability to do the necessary assessment work.

It is calculated that in ten years of the Comstock workings over 5,190,000 cords of wood were burned in the sixty steam hoists and pumping plants. Between the years 1874 and 1879 over 4000 men were employed in the underground workings.

The Old Jordan and Galena mines at Bingham, Utah, were located Sept. 17th, '63, and have been operated almost continuously, thirty-five years. It is estimated that they have pro-

duced 10,000,000 ounces of silver, 30,000,000 pounds of lead, some copper, and \$2,500,000 in gold. The deposit is exposed to only 65 feet vertical depth, yet there are thirty miles of workings in the grounds.

THE Bloss & McClary hydraulic mine at Trinity Center, Cal., comprising 1000 acres, was sold last week to McDonald Bros. & Co. for \$50,000. A contract has been let for 400 M. feet of lumber to build a 4-foot flume for a perennial water supply.

ANTIMONY found near Havilah, Kern county, Cal., recently sent to the National School of Mines, Paris, France, by A. Blanc, of Alameda, Cal., assayed, quartz and argite, 9.30; antimony, 90.00; arsenic, trace; lead copper, silver, none; total, 99.30.

THE Yellow Boy and Tam O'Shanter mines in Pitkin Co., Colo., are 14,000 feet above sea level. The Jumbo mine in Chaffee Co. is 13,500, whilst the King Solomon in San Juan Co. is 14,000 feet. They are in a formation of limestone connected with porphyry.

THE Camp Bird mine near Ouray, Colo., comprising thirty-five claims, is owned and operated exclusively by citizens of Ouray. The property is above timber line, and, though amid snow peaks and in the line of snow slides, the men are well housed and the mill runs steadily.

W. A. KEARNS, superintendent of the North Star mine at Silverton, Colo., furnishes the following recipe as an aid in welding steel: Carbonate of ammonia, ¼ lb.; soda of borax, 2 lbs.; muriate of ammonia, ¼ lb.; black oxide of manganese, ¼ lb. Grind and thoroughly mix.

ANY mineral lands in any forest reservation, shown to be such and so subject to entry under the existing federal mining laws, are not included in the recently promulgated rules regarding forest reservations. Mineral lands in those reserves are subject to location and entry the same as before.

THE advance in sulphur in the early weeks of the war caused the profitable working of Utah, Nevada and California sulphur deposits, thousands of tons having been shipped. The price has fallen to its former figure, but it is believed that the new trade connections made will enable the home industry to compete with the foreign product at a slight margin of profit.

ACCORDING to G. T. Brilby the world's annual production of ferro-cyanide and cyanide, calculated as yellow prussiate of potash, is estimated at 8700 tons. The consumption of cyanide is estimated at 2600 tons, equivalent to, say, 3300 tons of yellow prussiate. Prof. Wm. Ramsay reported in 1895 that it was possible to produce cyanide, commercially, at a cost of 10 cents per lb.

THE recently organized Klondike Miners' Association held its first meeting August 29th and drafted a letter to the Canadian Governor-General, appealing for the appointment of a Commission of Inquiry to inquire into the manner in which Gold Commissioner Fawcett has conducted his office, and also making specific charges against him and other Canadian officials.

WHAT is believed to be the largest piece of gold free of quartz ever found in the world was taken from Beyer & Holtermann's claim, Hill End, New South Wales, on May 10th, 1872, its weight being 640 pounds. It measured 4 feet 9 inches long, 3 feet 2 inches wide, and averaged 4 inches thick. Its value was \$148,800. It was found embedded in a thick wall of blue slate at a depth of 250 feet from the surface.

DOUBLING the length of a board or timber reduces the stiffness eightfold and the strength one-half. Doubling the width of a board doubles the stiffness and strength. Doubling the thickness of a board or the depth of a timber increases the stiffness about eightfold and the strength fourfold. If, therefore, it is desired to double the length and retain the same stiffness, it is necessary to double the thickness or depth.

THE statement going the rounds that some time ago responsible men of Butte City, Mont., offered \$10,000 reward for the discovery of a process whereby the destructive smoke of the smelters might be done away with, but that so far the reward has not been claimed, interests the officials of the Mountain Mining Co., at Keswick, Cal., who would like to find some feasible solution of the smoke problem in that vicinity.

THE copper mine at Falun, Sweden, has been worked for 700 years. From records it is learned that the mine has yielded 500,000 tons of copper, 15 tons of silver and 1¼ tons gold, representing a value of about \$27,500,000. The mine is 1200 feet deep. Its greatest production of copper was in 1651, when 3066 tons were made; the lowest was 338 tons, in 1838. The mine, in addition to its metallic products, yields large quantities of red ochre.

FOR 1897 the United States' production of lead was 196,295 tons, of which amount the Cœur d'Alene, Idaho, lead belt produced 69,600 tons of metallic lead, having shipped during the year 116,000 tons of concentrates averaging 60 per cent lead and 30 ounces silver to the ton. The output was made up from the three districts—Canyon Creek, Gardner and Mullan, as follows: Canyon Creek, 54,565 tons; Gardner, 36,715 tons; Mullan, 23,660 tons.

THE revenue collected for the Canadian Government in the Yukon for the seven months ending July 31st, '98, is thus stated: Sale of lots in Dawson, \$28,450; liquor permits, \$6829; certificates and licenses issued by Gold Commissioner, \$90,964; fines, \$1695; lease of water front for three months, \$7500; Crown timber account, \$923; customs, \$38,000; royalty on gold produced, \$351,738; total, \$526,145. In addition, \$24,000 was collected on behalf of the Northwest Territorial Government for saloon licenses.

SOMETHING new is noted in the employment by the Anaconda, Mont. M. Co. of a "geologist"—straight. This company recognizes in this way the fact that, while a mining engineer knows something of geology, the relation of that useful science to economic mining is sufficiently intimate to justify the employment of a specialist therein, in addition to the mining engineer who usually has his time fully occupied with more pressing daily problems.

It has been decided in California courts in case of a working bond or sublease that where the owner or owners of the mining property so bonded or leased gave due public notice of the fact that he or they would not be responsible in any way for labor or supplies bought or secured or bargained for by the bondor or leaser, that the property could not be attached for any debt contracted by the bondor or leaser in connection therewith. A notice setting forth the detailed facts and conspicuously posted on the leased or bonded premises, or published in the nearest newspaper, should secure the owner or

owners from any financial responsibility. What is required is that the owner or owners shall make their disclaimer public and of general knowledge to all interested so far as possible.

SOME surprising statements are made by South African papers regarding surface conditions in the mining world there. One paper—the *Critic*—asserts that thievery of gold is a governmental practice there; that "the machinery of the State is used for the purchase of gold stolen from the mining companies by dishonest employees. The gold thefts from the Witwatersrand mines amount to at least 50,000 ounces per month." That would be over \$10,000,000 a year. The Government denies the charge.

PROGRESS during the last few years in the smelting of lead and silver ores has been mainly in improvement of construction, better knowledge of the chemical requirements for the constitution of the ore charges, greater care in the choice and preparation of the fuel used, and more perfect arrangements for the collection of flue products. The competition among smelting works has raised the prices they pay to the miners for ores, and the incentive to find more economical methods, and practice greater economy in the methods already known, has been strong, and the results correspondingly remarkable.

THE congressional enactment exempting U. S. soldiers owning unpatented mining claims from the customary annual assessment work, and exempting them from their share of such work in any case where they are jointly interested, went into effect June 1st, '98. Briefly, it provides that at any time prior to January 1st of each year if a U. S. soldier file with the county clerk or recorder in the county or district in which the claim is located a statement that he is in the volunteer service of the U. S., no one can relocate his interest in the claim, the assessment work being deemed done by the Government as to his interest.

REGARDING the so-called "selective action" of potassium cyanide for gold, W. A. Dixon considers the term "selective action" as inappropriate, and points out that in the treatment of ores with solutions of cyanide, the cyanide dissolves the free metal, which is generally gold, so long as free oxygen or its equivalent is present, and subsequently any remaining cyanide attacks the compounds of its base metals, hence when comparatively much cyanide and little oxygen is present, as in strong cyanide solutions, much base metal and little gold is dissolved, but in dilute cyanide solutions the conditions are reversed, and so also is the result, so that much gold and but little base metal pass into solution.

It is not always practicable to prevent electrical insulation from being spoiled. Soldering acid, as commonly used, is a solution of chloride of zinc. If this falls on cellulose it turns to a paste. It never evaporates, always takes up moisture from the air, and will gradually eat its way through quite a thickness of insulation. Whether it is acid or neutral makes no difference so far as its action on the insulation is concerned, though the neutral solution does not corrode the wire. Resin has the disadvantage that it is not a fluid and is clumsy to handle. By shaking up powdered resin in very strong ammonia, an ammonia soap is produced which works well in most cases. The ammonia dissolves the copper oxide and evaporates afterwards, leaving the powdered resin, which is an insulator.

THE borax works in Harney Co., Or., mentioned recently in "Concentrates" are in Rose Valley, fifteen miles from Disaster peak, Nevada. Water for domestic use is procured by condensing steam arising from the hot springs, the hot water itself being too strongly impregnated with borate of soda to be used. The borax is the result of evaporation of the water from these springs upon the desert, and the product is obtained by scraping up the dirt, boiling in the tanks and condensing the solution, employing a small proportion of sulphur to crystallize the borax while in the tanks. The crystals adhere to the sides of the tanks or to any article hung in the solution. The water is then drawn off, the crystals knocked from the sides of the tanks and sacked for shipment. The sulphur used is obtained on the surface of the same ground where it is found in large flakes.

THE Nogales Oasis tells of a deposit of sodium carbonate, recently discovered in Sonora, Mexico, two miles inland from Adair bay, an indentation from the Gulf of California, 100 miles south of the mouth of the Colorado river. The deposit covers an area about seventy acres in extent, in the center of which are several flowing springs, the water being strongly impregnated with the salts. This water has spread over the surrounding area, and evaporation has formed a crust of the crystallized salts, 1 to 3 feet in thickness, beneath which is a foot or 18 inches of water. As this crust, which is the product, is excavated and taken away the water from below quickly fills its place, and very shortly, by evaporation, it is completely renewed, making the deposit practically inexhaustible. It is estimated that there are fully 100,000 tons available in the deposit, and a trial shipment to San Francisco yielded handsome returns. Sodium carbonate is used in the manufacture of acids, glass, bi-carbonate of soda, etc.; the demand is steady.

GRATIFYING indeed are the daily words of commendation received from subscribers and readers everywhere. One, writing from Douglas Island, Alaska, this week, says: "I feel every heart-beat of the mining world through your paper." A Prescott, Arizona, man says: "Other mining journals rarely have their wrappers removed, but yours is grabbed, and often carried off before I have time to read it." A Los Angeles, Cal., reader writes: "You folks seem to know just what is wanted." Another from Nogales, Arizona, somewhat critically says: "The advertisements are the most interesting part of the paper," which opens up another field of thought. Probably the most satisfactory of the commendations received during the week is that from a Cœur d'Alene, Idaho, subscriber, who says: "I long since learned to believe what I see in the MINING AND SCIENTIFIC PRESS." Reliability and accuracy are the constant aim, and, though not infallible, it is believed very little gets in that is not exact truth. Not all is commendatory. Frequently come sharp little reminders of remissness and caustic criticism on sins of omission or commission. These are of value when just and deserved, effort being made to deserve such comment as little as possible. This journal deems itself fortunate in having so many kindly critics in the mining world, for if they did not feel so intimate an interest in it they would not take the trouble to point out its occasional errors, mistakes or omissions. The standard demanded is a high one; much is expected; and, because of this, is gladly welcomed such candid expressions of opinion.

Mining and Mill Practice in Arizona.

TO THE EDITOR:—To a Pacific coast Zaccheus roosting up a tree, and with some knowledge of California practice as applied to the milling of free gold ores, it would appear that with the innovation of a crew of mill hands approximating a man to the stamp, with a rock crusher, on friable quartz, mortar plates, a single 12-foot amalgamating plate, and a 6-foot belt concentrator to herd, the highest efficiency would result, and at the least 80 per cent of the assay values be won, the gold essentially free and visible—shot, wire and flake, no float gold—the sulphurets and hematites of a premium concentrating kind.

Yet so perverse are these hitherto free ores of the desert that they will not respond kindly to the Colorado method of mill manipulation, as practiced here. So, approximately, 50 per cent of the gold values go to fatten the tailings pond.

Again, heavy draft horses are doubtless of peculiar and abiding worth in the transportation of Cripple Creek, Colorado, ores. But in this locality, when the summer heat reflects from off the sun-burned mesas, they do not fit the environment.

A mule is an unpretty, non-esthetic creature, but he is "powerful handy" and the only reliable element in remote desert transportation.

However, one learns many new wrinkles in an unfamiliar country, though sometimes the knowledge comes high. Reference is here made, and these practical examples are cited to illustrate upon what ground many mining ventures founder, *i. e.*, in trying to bend the local conditions to meet the requirements of a totally different locality, instead of making the "practice" fit the locality.—

"Thus sickness doth inflict
The very life-blood of an enterprise."

The several failures by mine operators from other sections in this desert region are generally traceable to this self-sufficiency. It is often "money in thy purse" to absorb a bit of local experience with the ozone of a strange country.

That Colorado produces and has some of the most skillful, progressive and competent mining engineers, mill men and miners of any locality is beyond the shadow of a doubt; but in so far as the desert region bordering the Colorado and Gila rivers is concerned, with their "sweet" ores, the truly competent mine manager is yet a resident of Colorado.

And here, by way of parenthesis, the writer would suggest to any Colorado people who would emulate the success of the California miner in this desert field that, as a preliminary starter, he procure and carefully study the difference in the Colorado practice and the California method of gold milling, as ably and fully recited in "Stamp Milling of Gold Ores," by T. A. Rickard of Colorado.

Briefly related, here is one Colorado fiasco as an illustration of which the writer has personal knowledge:

Given a partly developed group of gold claims—thickness of vein 12 to 20 inches, dip of 80°, walls of granite, gouge cased both sides, gold free and visible in clear grit quartz, easy breaking ground to strip ore, ready of access, five miles from mill and down-grade pull, wood in abundance (mesquite delivered at \$2 per cord at mill), average assay of ore \$25 per ton, with the 5-stamp mill now on ground, a practical California manager should net from \$40 to \$75 per day.

But there's the rub—"practical manager." This factor was wanting. This property of merit was secured under bond and lease by Colorado sporting men. They incorporated, sold shares for twelve head of heavy draft horses, Colorado breed. These unacclimated animals were driven overland from Colorado City at a large expense, with them low-wheeled logging wagons. With the teams came a nondescript crew of "swampers"—unskilled labor—to whom were added from time to time barroom rounders, all under pay. There was at no time a head; the manager, a sickly man, from pure physical weakness and want of force and positiveness let this harmful element do about as it pleased.

In the regular, defined ore shoots of the mine occurred rich pockets of friable and fragile honey-comb quartz, holding a value of from two to five ounces gold per ton. This was taken down carefully in the mine on canvas, and often sacked before sending on top. This and all classes of ore was sent down in a car to an open platform, from whence it was shoveled into wagon beds, none too close as to cracks, as so much sawdust would have been handled by teamsters more familiar with sawdust than rich gold ore. Arriving at the mill, it was again carelessly shoveled into the mill ore bin. In every instance ore rich in metallic gold and dust, from which a good string of colors could be panned in the naked hand, could be taken from the ground in both places, mine and mill. The superintendent, an Arizona man, kicked and growled and fought (as would any true miner) at this uncalled-for loss, but the general manager moved in his easy way, and the Colorado contingent voted "the 'supe' a damned crank."

At the mill a somewhat similar condition obtained.

There were five to six men herding the 5-stamp mill plant. The Colorado millman, though given too much to slow drop of stamps of the Colorado mill practice, was gradually getting the mill into higher productive condition, though assays showed the tailing pond enriched from \$7 to \$13 per each ton of ore crushed from \$30 rock. The concentrates had gradually advanced from \$40 to \$243 per ton. Discord and unhappy quarrels between principals and stockholders determined them to make an example of some one, so the millman—the most efficient member of the outfit, and who was fast catching the swing of the ores—was relieved and a so-called "mining engineer" and world-beating amalgamator was installed. Taking full charge, the mine was gutted to the surface from the 75-foot level, and one of the most wonderful creations, I venture to say, that ever was seen in a thin-veined metal mine is in evidence of his methods of mining; and 50 feet below the 75-foot level there is sunk a shaft, or rather a cellar, 14 x 11 feet, on a 14-inch vein, and that is in the center of this chasm.

Space will not permit mention of the general reversal of all fixed rules of economical mining. Too many men by half were worked, and, worst and saddest of all, they were not paid their wages and never recovered a cent, as the owners of the property, not liking the turn of affairs, had in a legal way estopped any claims as liens against the mines.

The manager skipped; the residue of hobo-miners, with a sprinkling of good men, looted the commissary and would have damaged the property if the owners had not choked them off.

Thus ended what might have been a dividend property under competent management, for the mine is conditioned to-day, as a tangible, "going concern," with ore of good commercial value in all headings, and will be worked by the owners, if not sold, and a paying mine result.

Should this story, showing the prime necessity of having a practical business man at least, if not miner, to supervise affairs, as manager, and one not too "wise in his own conceit" to learn the ways an unfamiliar country, tend to warn one embryotic mine investor that something more than sleek talking or a "jolly good fellow" are factors to be considered in successfully winning gold from the rock, then this letter shall not have been written in vain.

TAYLOR D. MACLEOD.

Yuma, Arizona, Sept. 3rd, '98.

Why Sandstone Was Used.

TO THE EDITOR:—In reference to an article published in your paper of Sept. 10th, '98—"Carrying Coals to Newcastle"—regarding the use of sandstone in the new courthouse at Sonora, Tuolumne Co., Cal., allow us to state that the members of the Board of Supervisors and ourselves would only have been too pleased to use Columbia marble if the same could have been had, or even granite. Those owning the quarry and those having the bond on said quarry could give no satisfaction to us regarding the furnishing of material, and after trying for months to come to some arrangement whereby marble could be used, we were forced to give it up and therefore adopted sandstone. It does seem a pity not to have used marble as we were very much in favor of it. As the fault does not lie with either the Board or yours truly, we nevertheless agree with you in this article: that when stone can be had near by it should be used.

WM. MOOSER & SON.

San Francisco, Sept. 14th, '98.

Gasoline Engine at an Arizona Mine.

The illustration herewith shows the parts of a complete 10 actual H. P. Weber gasoline engine, recently built by the Weber Gas & Gasoline Engine Co., 430 Southwest Boulevard, Kansas City, Mo., and installed by the Decatur Copper Mining Co., near Jerome, Arizona.

The complete plant set up weighs 7200 pounds. The plant was sectionalized for burro transportation, bringing all the parts down to required weight. In addition to hoisting, the engine will be used for operating a Cornish pump and power for ventilation. The Weber people have built several of these machines for out-of-the-way localities, especially in southern California, Arizona and Mexico. The manufacturers say that a single burro can carry fuel enough on one trip to operate a 10 H. P. gasoline hoist ten days, operating twenty-four hours per day, which makes these engines valuable where all

fuel must be freighted, or where water is scarce, as a 10 H. P. hoist ordinarily uses only two gallons of water in twenty-four hours.

Zinc-Lead Ores in Colorado.

TO THE EDITOR:—In reply to "Utah Miner's" request for information regarding a market for zinc ore, in your issue of the 3rd inst., I will state that I have marketed that class of ore and have devoted considerable time to finding a market. The Missouri and Kansas zinc smelters pay \$20 per ton at the smelter for 65% zinc ore, free from iron or lead. The Canyon City, Colo., plant of the American Zinc-Lead Co. buys zinc-copper-lead ore. The zinc and lead is manufactured into paint; the gold and silver values are retained in a copper matte. A zinc-lead ore containing copper, say, from 2% up, will find a ready market at these works with, say, a treatment charge of \$5 to \$8 flat, 95% of New York price on silver, market price for copper and about two-thirds of the market price for lead. The railroad rate on zinc ore is about one-third less than on lead ore.

The Bi-metallic Smelter at Leadville, Colo., also buys it. Zinc ore (sulphide), containing 25% lead, would get a treatment on car lots at Leadville smelters of 10% to 15% of 50c a unit excess, or 8% of 30c unit excess; lead 53c per unit, 5% off for loss in treatment of silver, New York price. The treatment charge will depend on the character of the ore: if the gangue is iron and lime, the charge would be less than if a silica base. Suppose the ore contains 25% Zn., 25% Pb., 25% S., 15% CaO, 10% Fe., the treatment charges would be about as follows:

| | |
|---|--------|
| Neutral charges per ton (up or down)..... | \$4 00 |
| Zn. 25%, 15 of 10 excess @ 50c..... | 5 00 |
| Sulphur 25%, 13 of 12 excess @ 20c..... | 3 00 |

| | |
|------------|---------|
| Total..... | \$12 00 |
|------------|---------|

| | |
|---------------------|---------|
| 15% Lime @ 10c..... | \$1 50 |
| 10% Iron @ 10c..... | \$1 00— |
| | \$2 50 |

| | |
|---------------------------|--------|
| Net smelting charges..... | \$9 50 |
|---------------------------|--------|

Or say the ore contains: Zn 25%, Pb 25%, Sulphur 25%, Lime 5%, Iron 10%, Silica 5%, Baryta 5%:

| | |
|-----------------------------------|--------|
| Neutral charges (up or down)..... | \$6 00 |
| Zinc 25%, 8 of 17% @ 30c..... | 5 10 |
| Sulphur 25%, excess @ 20c..... | 3 00 |
| Silica 5%, excess @ 10c..... | 50 |

| | |
|------------|---------|
| Total..... | \$14 60 |
|------------|---------|

| | |
|----------------------|---------|
| Lime, 5% @ 10c..... | 50 |
| Iron, 10% @ 10c..... | \$1 00— |
| | \$1 50 |

| | |
|--------------------|---------|
| Total charges..... | \$13 10 |
|--------------------|---------|

These charges will vary considerably at the different reduction works. On a large tonnage, contracts can be made on far better terms than these. Zinc ore is plentiful in this State. Immense bodies of zinc blende and sulphide are exposed in the mines at Robinson and Kokomo. The Col. Sellers and Moyer mines at Leadville could ship thousands of tons on short notice. The Clear Creek and Georgetown mine ores contain a considerable percentage of zinc.

At Aspen the Smuggler mine contains large bodies of zinc-lead ore, which is separated at the company's mill, making a 70% to 80% lead concentrate. There is more or less zinc ore in nearly every silver mining camp in the State, and all the large smelters have special facilities for roasting and smelting zinc sulphide ores.

MINER.

Aspen, Colorado, Sept. 18th, '98.

British Investors and California Mines.

TO THE EDITOR:—By those who are truly desirous of making a legitimate business in the matter of promoting an interest in California mining properties in this country, the closing sentences of your article on "London Stock Jobbing Sharps," in your issue of the 6th inst., saying: "There is neither sense, honesty or business in such work, and the sooner it is ruled out the better. An owner who desires to make success of a sale should determine upon his price, allow the promoter a reasonable advance to pay him for his trouble and business service, then demand in writing that no additional loading under any circumstances shall be put upon that price. This would enhance the likelihood of a sale. The English buyer would thus have value received for his money, and the American mine owner and promoter would be credited with fair dealing,"—can not but be honestly endorsed and heartily welcomed. You may have remarked that the reports recently issued from the British Consulate in San Francisco extensively endorse and strongly commend much that has been temperately and judiciously advanced in your editorial and in your columns, during the past year or so, in respect to the buying and selling of, or interesting foreigners in, California mines.

The British investor, when once interested in any enterprise that has merit and is honestly managed, is an individual worth cultivating, for he, unless returns are wholly wanting, rarely complains, and is seldom unwilling to respond to a call for additional capital, if made by a capable management in

which he has confidence. It is to be hoped that in view of the important and favorable notice given to Californian mining by the British Consulate, together with your well-timed advice that mine owners may perceive it to be in their own interest—apart altogether from any general advantages that must necessarily arise in connection with all mining negotiations—not to be too unreasonable in their demands as to terms, etc., but to be prepared to meet business proposals on business lines.

AN ENGLISH READER.

London, Aug. 20th, '98.

Two-Stamp and Three-Stamp Mills.

The Parke & Lacy Co., 21 and 23 Fremont St., San Francisco, have just completed and placed on the market a two and three-stamp mill of new design, embracing several notable features. In designing the mortars particular attention has been given to the distribution of the metal in such a manner as to avoid unequal strains in cooling, with the object of lessening the liability of the mortar to crack when in use or through rough handling during transportation. The mortars have three discharge openings, on the front and on both ends, and the pulp from the end discharges is brought to the front by means of

Oregon pine battery posts, oak guides, inside amalgamating plates, cam shaft, pulley and all bolts, nuts and washers for the frame, mortar block and foundation. The mortar block, sills and stringers and the outside amalgamating plates are not included.

| TABLE OF SIZES, ETC | | | | | | | | | |

Floating California Mines in England.

TO THE EDITOR:—Notwithstanding that the requirements for the end of August, occasioned chiefly by a keen demand for gold on American account, caused a sharp twist-up in the money market, the

hardly see how we could be on the lines you propose. To know whether a successful flotation could be made here or not, one would require to frame or prepare a prospectus, with the view of securing underwriting or guaranteed subscriptions for, say, £——, and if this could be done you would then have a certainty of working capital, whether you were able to dispose of many more shares or not. A capitalization of, say, £——, £—— of which to be for providing working capital, would appear to be by your letter a fair basis to proceed upon, and would give to you and your co-owners £—— in cash or shares, in accordance with how the proposal might be responded to by the public. In order to ascertain whether underwriting is attainable, a prospectus is imperative, and to formulate one it would be necessary to have a superintendent's report, supported by a separate one from some mining engineer whose name is known on this side, and of such there are not a few in California. The initial expense in this respect need not be great, while the cost of printing proof prospectuses, underwriting letter forms, and providing for other indispensable items, should not exceed, say, £50 or £60 (\$250 or \$300). Whether you would care to risk this expense is for you to determine only; we can see no other way of your being able to do anything with the property on this side that would be half so advantageous to its owners, as with the underwriting assured, they would have the essential working capital, as well as the management of the mine. In other words, without underwriting or guaranteed subscriptions for a portion of the capital, no one is likely to risk the heavy costs associated with registering and advertising a company; neither will anyone not already interested in the mine—unless they are without experience—entail even the preliminary expenses above alluded to. So it is simply a question of whether you are willing to hazard the trifling costs in order to ascertain whether underwriting is or is not attainable."

The time has gone by when either individuals or companies can be induced to put up, say, £1000, or \$5000, for a month or so extension of an option on a "dead" mine. A dozen years or more ago it was alleged that old man Davis received such a sum several times for an extension of time on the Allison Ranch mine, when it was filled with water; but gold mines are much more numerous now than they were then, and the methods of dealing in them have altered accordingly.

A LONDON PROMOTER.

London, Sept. 10th, '98.

Grade of Plates in a Gold Mill.

TO THE EDITOR:—In the best modern practice the standard grade for a full-width plate is never less than 2 1/4 inches per foot, and this is only employed where the ore is a clean quartz, with no slime, and a very small percentage of sulphurets. On average ore this grade will be 2 1/2 inches per foot; on the 16-inch sluices a grade of 2 inches per foot, and on the 4-inch sluices a grade of 1 inch per foot is essential, unless 1-inch angle strips are put on each side of the sluices, when 1/2 inch can be employed.

The aim of millmen is steadily directed to saving everything of value in the ore which can be done without expending more in cash than is recovered. To do this the various operations are harmonized as much as possible, so that the tailings, when they finally leave the mill, are practically valueless.

In saving the sulphurets to a high percentage the amount of water used is absolutely limited, and to employ only this fixed quantity a certain minimum grade has been established from practical experiments by experts, extending over many years and on ores of every locality.

It took a long time to overcome the objections of those accustomed to slight grade and, in consequence, an excess of water, as they could not be persuaded except that the loss in free gold and quicksilver would create a big deficit in the immediate returns, and it certainly did as long as the habit of using wet amalgamation was adhered to. But, to the astonishment of all these objectors, when the amount of quicksilver was reduced to its proper quantity, the free gold saved on the plates was materially increased, and it was caught very much nearer to the battery.

The explanation of this can be readily understood on watching the course of the pulp down the plates. All ores contain gold in various sizes, the finest being called "float gold," and also the hardest to save. Yet it is the recovery of this, owing to the steeper grade and the smaller quantity of quicksilver employed, which increased the total yield, to the astonishment of the early amalgamators. The coarse gold remains in the battery or is held on the lip plate, owing to its weight and specific gravity, but the fine gold is carried along by the current, above the sand, and would be lost if a good deal of water were used. With the proper amount of water for subsequent concentration, the pulp is observed to run or rather roll down the plates in a succession of waves, each surface of a wave touching the amalgamated plate, when the gold is at once seized and held. Wherever quicksilver goes, fine gold in solution

TWO-STAMP MILL OF NEW DESIGN.

an apron or trough, where it joins that from the front discharge, and all then flows over the plate. This apron is cast separate from the mortar, to which it is attached by bolts, this form of construction being considered preferable to that in which the apron is cast to the mortar, as there is less liability to breakage during transportation, and, in the event of breakage, a new apron can be substituted at small cost. Silver-plated copper plates for lining the mortars are furnished with these mills and are included in the price. They are 1/4-inch thick and a wrought iron plate is riveted onto the bottom to stiffen them. Each end of these plates is held in place by a key, which can be loosened, and the plate raised or lowered to suit the height of discharge and the wear of the dies, the use of chock blocks being thus dispensed with to avoid the possibility of an accumulation of heavy matter to choke the discharge. Two sets of screen frames with different widths of rails are furnished with the mills, so that the height of the discharge can be regulated as the dies wear.

The cams are built on approved lines or curves, designed to lift the stamps with a minimum of friction and power. The cam shaft is set into the boxes from the front side of the mortar, and the stems are set into the guides from the back, so that either can be removed without disturbing the other, thus enabling the operator to make repairs quickly.

They are built in but one size (900 lbs. stamp); the price includes the ironwork complete for the mill,

accuracy of the following, which appeared in a leading financial paper on the 29th or 30th ult., is but little affected: "The prospects are not so inspiring as they might be, and it is quite on the cards that continued inaction will prevail until circumstances are more favorable for the charming of fresh capital from John Bull's pockets, which are still well lined." That there is no lack of what may be termed inactive capital in this country, there can be little room for doubt. Though, in such a connection, the question arises: How can it, or any portion of it, be made available or "charmed" for the development of mining or other enterprises located, say, on the Pacific coast? To answer this question satisfactorily is well nigh impossible, and as individual capitalists or speculators seldom interest themselves in mining property, unless with the object of offering it for public subscription, which they rarely do in a fashion that is either fair to the mine owner or to those who subscribe for shares, it occurs to me to observe that the mine owner might do much for himself in the matter of advancing his own interests, as well as those of likely investors, providing he is not adverse to adopting in some degree the suggestions embodied in the following excerpts from a letter written in answer to inquiries made by a California mine owner in search of "development" capital: "If you have an option on the whole property, and are inclined to promote or float the mine yourself, we could possibly be of some service to you; but we

goes with it; and to prevent a loss in this way the amount of quicksilver employed is reduced so much that to a person brought up under the old regime it appears as if the loss must be excessive. It is not; but, on the contrary, a gain is obtained, owing to recovery of the float gold from the small loss in quicksilver.

W. J. ADAMS, E. M.
San Francisco, Sept. 20th, '98.

Tabulated Results of Mill Work.

TO THE EDITOR:—I was greatly interested in the article from E. L. Ballou, in the issue of Aug. 20th. I enclose blank form which I have used for

usual size. Sometime ago Supt. Jackling got a dose of the gas, and for some time his life was despaired of.

A Short Account of Cyanide Practice in New Zealand.

There are at present substantially three systems used in the application of cyanide. First, the process as recommended by the Cassel Co., after a number of experiments and till recently adopted at almost every mill. In this process the ore is dried in kilns of varying construction. In some cases it amounts to a partial roasting, this being particularly

An Electric Foundry.

The electric appliances that run the Reading, Pa., Car Wheel Works are the first electrical equipment ever installed in a foundry. The current is taken from the Metropolitan Co.'s wires. Several times when the bottom of the cupola has been dropped the motor has been splashed with molten iron, but this occasioned no trouble. Motors run the elevator and the drop used for breaking old car wheels. This drop has a fall of 40 feet. The carriers have a capacity of about 800 pounds to the floors. These ladles are operated by a small reversing motor, which can be run by the man in charge of the pouring ladle. The five-

some time to tabulate results of our mill work. It goes without saying that this form must be made to fit the conditions existing at each mill, or other reduction works, where used, and may be extended or curtailed as desired. Only the most important routine of mill work needs permanent record and minor matters may safely be left to the notebook of the foreman, or omitted entirely. This idea has guided me in working up the blank forwarded. First, the amount of ore crushed and its product, both in concentrates and bullion. My assay of these products serves as a check on the smelter returns, though on concentrates they are not expected to be exact, owing principally to the varying amounts of moisture contained in them.

I have long since abandoned the "battery sample," as being practically impossible to take with accuracy, but if my tailings are satisfactorily low my mind is easy on that score, and returns show the value of the ore milled. At the end of any desired period add the various columns necessary and you have at once the aggregate of work done, etc., from which it is easy to ascertain the daily averages, per ton values, etc.

Our ore is delivered from mine to mill, a distance of 3600 feet, by running water in a flume, and one bin is being filled while contents of the other bin are being worked, the ore being entirely used from each bin alternately. The test made by Mr. Ballou, in feeding quick inside and outside of battery, is very interesting, but it would be more satisfactory were he to continue the test for several weeks in succession. Might it not be possible that a slightly different grade of ore went to the different batteries, thus accounting for the considerable difference in amount of amalgam won? Supt. BALD EAGLE MINING Co. Sum Dum, Alaska, Sept. 4th, '98.

Killed by the Fumes.

At Mercur, Utah, recently, W. E. Ward and J. Weinhart, employes of the Golden Gate mill, died from inhaling arseniureted hydrogen.

In the Golden Gate the ore contains sulphur and arsenic. In roasting some of these remain, associating themselves with the cyanide solution. The gold is separated from the cyanide by sulphuric acid and the arsenic and zinc brought into contact with a strong acid will produce this gas, which is colorless with a garlic smell, the sulphur and hydrogen combining, forming sulphuretted hydrogen with a "rotten egg" smell. From the tank in which the precipitation of the gold is accomplished both gases are generated, the first deadly in its effects, the second comparatively harmless except as far as the nauseous smell is concerned. Over this tank is placed a hood and electric fan to draw the fumes out of the room, and it is impossible for the gas to escape into the room where the men are at work.

After the work of precipitation the solution is drawn off into another tank. Here the solution has been tested time and again, but no trace of arsenic has ever been found. On this particular occasion the solution appeared cloudy and some zinc dust was screened into the tank. One of the men, Gilson, sifted the dust into the solution while Ward and Weinhart stirred the mixture. In a few minutes Ward was overcome and was taken out. No evil effects were felt by the other two for some hours. Ward died two days after, while Weinhart lived six days.

An examination was held over the body of Ward to find out how the gas affected the system. The gas has the effect of disintegrating the red corpuscles in the blood, leaving only a yellow fluid, unable to perform the regular functions of carrying oxygen and nutrition to the various parts of the system. The disintegrated corpuscles are thrown out of the system in the shape of clotted blood, through the liver and kidneys. It was found in the case of Ward, that both these organs were increased to twice their normal size and the spleen was at least five times its

beneficial if the ore is at all clayey in its nature; then crushing in stone breakers and stamps, a 40 or even 60-mesh screen being used, the dust being conveyed to hoppers and thence distributed to the vats, care being taken to avoid packing. The solution of cyanide is then passed into the vats, percolating upwards. Usually sufficient is run on to form a 2 or 3-inch layer on top, the strength of the solution varying from 5 lbs. to 10 lbs. of cyanide per ton of solution. As this drains through, naturally at first and aided by a vacuum pump towards the end if necessary, a further supply of weak solution is added on top, varying in amount according to the ore under treatment, the final wash being water only. The solutions are passed through zinc towers in the usual way. An extraction of from 90 to 95 per cent of the bullion value of the ores is, in some cases, obtained in this way, notably at the Waihi.

The second process is carried out at the Crown mine. Here the ore is clean quartz with very little mineral, but a considerable portion of the gold is so fine that it is not discernible in the stone, similar in that respect to the Waihi, but also containing free gold in coarser aggregates. After a long trial of dry crushing they treat the ore as follows: It is passed through rock breakers and fed into the mortar boxes as in ordinary wet crushing, but the water used is a dilute solution of potassium cyanide containing about 1 lb. KCA per ton. The pulp is passed into tanks, the slimes and water passing into a settling tank and thence through the zinc boxes back to the battery. The slimes are sucked dry by means of a vacuum pump and then sluiced into the river, the sands being further treated with cyanide solution in the ordinary way and afterwards sluiced out over amalgamated copper plates. With this ore no difficulty is experienced in settling the slimes and a very good extraction results, although the consumption of cyanide is somewhat higher per ton of ore than in the dry crushed ore, yet this is more than counterbalanced by the saving in fuel and has also the advantage of more than doubling the capacity of the mill. The precipitation of the gold from the weak solution, though not very perfect, does not make any great loss, as the same solution is kept in constant circulation and being so weak does not become so contaminated as the stronger solutions. This is the only case that the slimes are treated apart from the bulk of the ore. So successful has this plan been with the Crown ore that the manager says he wishes the ore was all slimes when crushed.

The third process is similar in every respect to that carried out in the Transvaal, the tailings being filled direct into the vats by means of a distributor, almost the whole of the slimes being retained in the vat, the only difference being the vats are only about 4 feet deep. This also gives satisfactory results where applied. W. OAKES KIBBLE, F.I.C., F.C.S.

STATISTICS are presented in a recent number of *Nature* which tend to support the conclusions of Dr. Bruckner that there is a regular cycle, of about thirty-five years, in the course of which the earth experiences a change of weather from a cold and wet period, through a hot and dry period, back to a cold and wet period again. According to these statistics, we are now in one of the comparatively dry periods, but early in the twentieth century the condition of things will be reversed, and the wet years will outnumber the dry ones.

A NEW German exciting liquid for electric batteries—calcium—consists of oxychloride of calcium dissolved in a solution of sal ammoniac. This is cheap, a good conductor of electricity and does not crystallize even at zero temperature.

THERE have been shipped to Swansea, Wales, 5400 tons of American steel rails, to be used in the building of a road near that place.

ton ladle is run by a motor in the rear. All the carriages over the tracks are operated by electric motors. All motors are specially built to stand a temperature of 150°. They are equipped to reverse at varying speed. From each controller is run a hand rope to the floor, so that each molder has control of the speed and can vary it from 1 to 50 feet per minute on the hoist. Each hoisting motor has an electric brake. By electric power the red-hot car wheels are lifted from their molds and taken to the annealing pits. The system enables the men to work rapidly and at less cost than before. The tumbling barrels and pressure blowers are also run by motors.

MUCH of the land surface of the globe is still unexplored; the ocean is almost unknown; our collections contain thousands of new species waiting to be described; the life histories of many of our commonest species remain to be investigated, or have only recently been discovered. Take, for instance, the common eel. Until quite recently its life history was absolutely unknown. Aristotle pointed out that eels were neither male nor female and that their eggs were unknown. This was believed to be true until a few years ago. No one had ever seen the egg of an eel, or a young eel less than five centimeters in length. Thanks mainly to the researches of Grassi, it is now known that the parent eels go down to the sea and breed in the depths of the ocean, in water not less than 3000 feet below the surface. There they adopt a marriage dress of silver and their eyes considerably enlarge, so as to make the most of the dim light in the ocean's depths. In the same regions several small species of fishes have been regarded as a special family known as leptocephali. These also were never known to breed. It now appears that they are the larvae of eels, that known as leptocephalus brevirostris being the young of our common fresh water eel. When it gets to the length of about an inch it changes into one of the tiny eels known as elvers, which swarm in thousands up our rivers. Thus the habits of the eel reverse those of the salmon.

AN INTERESTING announcement is that of the assured progress of tapping the Nile river at its higher level above the cataracts, conducting the water to vertical shafts, down which it will fall to drive turbines, then using the power so generated to run dynamos, from which electricity in the form of alternating or continuous current will be transmitted to points near or remote. The water, after passing through the turbines, will be restored to the river at a lower level or else used to irrigate the land. There will be no waste of material, as in burning coal, and no smoke. Electricity will be applied, not only in pumping for the irrigation, but in driving machinery for preparing the raw products of the soil, spinning cotton, weaving silk and various other industries.

THE ordinary method of making white lead occupies months, but by electrolysis it is claimed that the finest quality of white lead can be produced in a few hours, and at an extremely low cost. The new method consists in the action of electrolytically generated nitric action upon lead, in which there are four reactions. This first consists in the electrolytic preparation of nitric acid and hydro-oxygen. In the second, the action of the nitric acid on the lead forms lead nitrate; the reaction of lead nitrate and sodium hydro-oxygen forms lead hydro-oxygen, while the combination of lead hydro-oxygen and sodium bi-carbonate forms lead carbonate, or white lead.

THE bright colors obtained in case hardening come only on bright and clean steel or iron. The secret lies in plunging the metal into the bath of water without letting the air strike it; then in cleaning the piece in hot water and drying it in sawdust, oiling it afterwards to keep it from oxidizing.

The Gas Engine.

In a recent paper read before the North British Association of Gas Managers, W. C. Peebles thus spoke of the gas engine:

"There can be no doubt that a great deal has yet to be done to improve the action of the gas engine. The main direction in which a change must be looked for is, I think, in the cycle. But this would seem almost impossible without introducing complicated mechanism. At present—at least with the smaller sizes—the successful competition of the gas engine with the steam engine is chiefly due to the convenience and economy with which the gas engine can be operated, especially for intermittent work. With engines above 40 or 50 H. P., using producer gas, the cost of working, as compared with steam, is very greatly in favor of the gas engine, as has been proved time after time. We shall find, therefore, that the large gas engines will not stop at 400 or 500 H. P., but increase gradually year by year, until they compete in power with the largest steam engines made.

"What the gas engine has done for the benefit of small masters it is impossible to estimate. Many hundreds of these employers were driven out of existence by the introduction of the steam engine. But they are gradually springing up again; and, by the aid of the gas engine, they are able to secure a respectable share of trade. That the gas engine will rank in the near future as one of the chief sources of power there can be no doubt; and I would add, in closing, that as gas managers are chiefly concerned in the manufacture of the working fluid, they should do all in their power—by giving a plentiful supply, at a good pressure, and, if possible, at a reduced rate—to help forward this excellent motor to a greater extent of usefulness."

Recently Declared Mining Dividends.

Yellow Aster, California, \$10,000; payable immediately.
 Republic, Washington, 3 cents per share, \$30,000; payable Oct. 10.
 Parrot, Montana, 3 cents per share, \$6900; payable immediately.
 Modoc, Colorado, 2 cents per share, \$10,000; Sept. 17.
 Gold Coin, Colorado, 1 cent per share, \$10,000; payable Sept. 26.
 Homestake, South Dakota, 25 cents per share for August and an extra of 25 cents per share for September payable Sept. 26; total, \$62,500.
 Napa Con. Q. M. Co., California, 10 cents per share and 10 cents extra, \$20,000; payable Oct. 1.
 Etta Con. Q. M. Co., California, 10 cents per share, \$10,000; payable Oct. 1.
 New Idria Q. M. Co., California, 10 cents per share and 10 cents extra, \$20,000; payable Oct. 1.
 Horn Silver, Utah, \$25,000; payable Sept. 26.

Recent California Mining Incorporations.

Golden Trout M. Co., Oakland; capital stock, \$100,000, subscribed \$69,900; J. R. Watson Jr., E. G. Perkins, C. L. Sturm, T. J. McClelland, C. E. Swezy.
 Strable Co-operative Slate Co., San Francisco, to operate at Kelsey, El Dorado Co.; capital stock \$500,000, subscribed \$12,505; J. F. Wetzell, J. A. Kinghorn-Jones, E. S. Tibbey, J. Strable, M. Hornfeldt.
 McKinley Spartan Con. G. M. & M. Co., Stockton; capital stock \$50,000; subscribed \$42,975; P. Miller, J. W. Empfield, W. B. Schuyler, J. W. V. Meseroll, E. L. Rehm.
 American Eagle M. & D. Co., San Francisco; capital stock \$150,000; subscribed \$410; L. S. Harvey, C. F. Bills, A. Rudolph, V. H. Robinson, R. Towart.

Commercial Paragraphs.

THE Colorado Iron Works Co. of Denver, Colo., has arranged with Mgr. Bartlett of the American Zinc-Lead Co. of Canyon City, Colo., to build his new concentrator at their works on royalty under his patents.

A. MIDDLEBROOK, the Denver manager of the Jeanesville Iron Works Co. of Jeanesville, Pa., writes that they are building for the Yellow Aster M. & M. Co., southern California, a compound mine pump for high duty discharge pipe five miles long, carrying water pressure of 500 pounds to the square inch, and that their shops are very busy on mine pumps of large sizes.

Coast Industrial Notes.

—Central Pacific R. R. Co. stock has advanced in New York from 17 to 23½, a share.
 —From The Dalles, Oregon, were shipped last week twenty carloads of wool to Boston, Mass.
 —The Southern Pacific has cut the salmon rate out of Portland to New Orleans to 85 cents a hundred.
 —The San Diego, Cal., Flume Co. is daily furnishing 1,000,000 gallons of water from its thirty-seven wells.
 —The railroad to Globe, Arizona, will be in operation Nov. 10. The Old Dominion will start its smelters to day.
 —A lumbering business is to be established at Hood River, Oregon, and a large mill will be built at the mouth of the river.
 —In Santiago canyon, twelve miles from Santa Ana, Cal., lignite coal is being mined and meets with ready sale at \$4.50 per ton.
 —The Great Northern Railroad has awarded a contract for 2,000,000 feet of lumber to James Bell of Everett, Wash., to be delivered in sixty days.
 —About one-half of the \$100,000 asked for deep drainage and mining on the Comstock, Nevada, lode, has been pledged by the Comstock mining companies.
 —Pendleton, Oregon, wants to negotiate for the sale of \$70,000 worth of water bonds and \$60,000 of outstanding city warrants at a rate not exceeding 5 per cent.
 —Quicksilver receipts at San Francisco in August were 2149 flasks, against 1879 flasks for the same month last year. The foreign exports were 375 flasks this year, against 294 in 1897.
 —Near Biggs, Cal., 550 acres of hemp this year yielded the growers from \$120 to \$200 per acre. A mill of large capacity has been built and is crushing and baling the product for market.
 —Near Butte, Mont., on the 1000-foot level of the Original mine, a cave-in killed D. Poletto; six floors were crushed in. About twenty-five men were working near Poletto, but escaped injury.
 —When the Sunset Telephone and Telegraph Company completes its long-distance line joining in a general system the States of California, Oregon, Washington and Idaho, one can talk direct from San Diego, Cal., to Boise City, Idaho, a distance of 1943 miles.
 —The Bellingham Bay, Wash., Improvement Company have decided to pursue the same method in the reconstruction of their big mill that was pursued when it was first built, viz.: erecting a small mill to cut the lumber that goes into the big one.
 —The steamer Charles Nelson plies between San Francisco and Seattle in opposition to the Pacific Coast Steamship Co. The Cleveland and Lakme will follow the Nelson. Passenger rates on the new line have been cut to \$12 first class and \$7 steerage. Freight rates have also been reduced.
 —Contracts for material and supplies for the system of wharves, docks and elevators now under construction by the Great Northern Ry. Co., at Seattle, Wash., and aggregating in value upwards of \$100,000, were let this week. A lumber contract for 5,000,000 feet has been let to three mills on Puget sound.
 —The Louisiana purchase made America a steamboat nation; the acquisition of Texas and California made America a railway and telegraph nation, and incidentally, the events of 1898 must bring America to the front in the only line in which she is backward and feeble, i. e., marine shipping, to the great profit of the west half of America.
 —The Francisco & North Pacific R. R. Co., which operates the lines to Ukiah, Cal., has leased its entire road, plant and rolling stock for twenty years to the California Northwestern Ry. Co. The consideration is the full net revenue of the road. The California Northwestern is a new railway incorporation, to build a connecting line from the S. F. & N. P. C. through Mendocino county, Cal.

—The Japan-American Commercial Journal, a paper published in Tokyo, states that two items of commercial intelligence have of late greatly impressed the Japanese. One is that American iron manufacturers are able to undersell the English market, and the other that the contract for the building and equipment of the new electric railways of London has been given to Americans as the leaders of the world in the new industry.

—The Oregon Short Line from Salt Lake City, Utah, to the Nevada State boundary will be built by A. W. McCune of Salt Lake and W. L. Hoge of Anaconda. The new road, financed by the Oregon Short Line, will be known as the Utah & Pacific. The Union Pacific graded the roadway nearly the entire distance ten years ago. The Oregon Short Line will furnish rails and equipment, in payment for which it will take the new company's bonds.

—The annual report of the Northern Pacific Railway Company, successors to the old Northern Pacific Railroad Company, shows gross earnings of \$23,697,718 and a net revenue of \$12,584,348. The remarkable thing seems to be that the operating expenses should fall below 50 per cent of the gross earnings. The additions and improvements charged up to income and reductions in values of property and taxes are set down at \$1,494,500, leaving a clean net revenue of \$11,977,035.

—A man returned from an extensive trip through Mexico says: "The greatest cry I heard was 'lack of workmen.' Railroad contractors and farmers are worrying about the scarcity of labor, largely due to the opening up of so many enterprises and the great amount of work being done on the haciendas. Especially will you find that thousands of

men are being sent to the isthmus of Tehuantepec. The great plantations there need men and they take them from the rest of the country."

—Several salmon, averaging twenty-eight pounds in weight, have recently been caught in the Sacramento river, Cal. From the fact that the adipose fin had been removed from each they were identified as fish liberated from the hatcheries on the Clackamas river in Oregon in 1897. This discovery is thought to refute the theories of Profs. Jordan and Gilbert, who have maintained that salmon remain from three to four years in the sea before reaching their majority and then return to the parent water to spawn.

—The Centennial Mill Co., Seattle, Wash., has a contract with the Russo-Chinese bank to supply 25,000 barrels of flour to be shipped to Vladivostok, Siberia. The Russo-Chinese bank, during August this year, bought \$300,000 worth of commodities. Most of the supplies for the construction crews of the new trans-Siberian railway are bought on this coast. Vladivostok has a permanent population of 30,000 or 40,000, besides 50,000 to 75,000 Russian soldiers, who rely upon the United States for nearly all their provisions.

—On the 17th inst. the Bakersfield & Los Angeles Ry. Co. of Cal. incorporated in San Francisco. The incorporators are Claus Spreckels, J. D. Spreckels, A. B. Spreckels, Robt. Watt, A. H. Payson. I. W. Hellman is treasurer. The capital stock is \$5,000,000. The railway to be built is 200 miles in length, from Bakersfield, over the Tejon Pass to Los Angeles. The new move is of significance, as at the latter city through Eastern connection will be made with the Santa Fe. The S. F. & S. J. Valley road thus becomes a transcontinental proposition, with a San Francisco bay terminus at Point Richmond.

—The Pacific Borax and Redwood Chemical Company, Ltd., otherwise the English Borax Syndicate, has filed a trust deed of all its properties on the Pacific coast to cover a loan of \$1,250,000, which has been made by the Indian and General Investment Trust, Ltd., of London, for the purchase or construction, through F. M. Smith, of a large borax plant at Constant Hook, N. J., whither is to be removed most of the large plant which the Pacific Coast Borax Company has been operating in Alameda. Extensive deposits of borax at Antofagasta, Chile, are also to be purchased. The deed recites that the works control borax mines or factories in San Francisco, San Bernardino, Inyo and Alameda counties, this State, and Esmeralda county, Nevada, and Curry county, Oregon.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey, Strong & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR WEEK ENDING SEPTEMBER 13, 1898.

610,790.—AIR COMPRESSOR—D. Beckers, San Pedro, Cal.
 610,755.—TRAP—E. Carpenter, Fisherman's Bay, Cal.
 610,599.—STAMP BATTERY—J. Champion, Enterprise, Cal.
 610,881.—WIRE STRETCHER—S. A. D. Clark, Pasadena, Cal.
 610,802.—ROLLER CRUSHER—W. J. Dyer, S. F.
 610,807.—CIGAR BOX—J. R. Grinsfelder, Spokane, Wash.
 610,810.—MARBLE CUTTER—Hawley & Clot, S. F.
 610,547.—LIFE BOAT—F. N. Lyons, Mendocino, Cal.
 610,764.—CONCENTRATOR—J. Malt, Los Angeles, Cal.
 610,554.—STEAM GENERATOR—J. McCartney, Oakland, Cal.
 610,661.—GATE—J. Ozenberger, Middletown, Cal.
 610,571.—JOURNAL BOX—V. Wigelius, Scotia, Cal.

NOTE.—Plain and Certified Copies of U. S. and Foreign patents obtained by Dewey, Strong & Co., by mail or telegraphic order. American and Foreign patents secured, and general patent business transacted with perfect security, at reasonable rates, and in the shortest possible time.

Books Received.

"Inspection of the Materials and Workmanship Employed in Construction," a reference book for the use of inspectors, superintendents and others engaged in the construction of public and private works, containing a collection of memoranda pertaining to the duty of inspectors, quality and defects of materials; requisites for good construction, methods of slighting work, etc.; by A. T. Byrne; 540 pages 12mo.; published and sold by John Wiley & Sons, New York, or will be sent postpaid from this office on receipt of price, \$3.

Catalogues, Etc.

"Modern Methods" from the Link Belt Machinery Co., Chicago, is about the most elaborate thing of the kind received this month; 300 pp. quarto, illustrating modern economical methods of handling numerous classes of raw and manufactured products, waste, etc., of interest to every one who wants to transfer or handle material of any kind on a large scale, the illustrations giving graphic portrayal of what the machinery does in a variety of instances. It is more interesting than a magazine. Any one wanting to see presented in a clear, practical way the latest devices in economical handling of all kinds of material should send for a copy of "Modern Methods" to the Link Belt Machinery Co., 39th St. and Stewart Ave., Chicago, Ill.

Obituary.

SUPT. JOHN DANIELS, the foremost mining man in the Lake Superior district, died at the Osceola mine, at Houghton, Mich., on the 13th.

Personal.

COL. GEO. H. MENDELL is in Astoria, Or.
 W. A. NEVILLS is again at the Rawhide mine.
 HERBERT LANG is at Ivanpah, San Bernardino Co., Cal.
 J. EDNY, Supt. Unity mine, Shingle Springs, Cal., is in San Francisco.
 C. DOBLER, Supt. Brown Bear mine, Deadwood, Cal., is in San Francisco.
 C. E. ARENTS of Alameda, Cal., is assayer at the Everett, Wash., smelter.
 L. T. WRIGHT, Gen. Mgr. Mountain Copper Co., Keswick, Cal., is in San Francisco.
 B. F. HARTLEY, Supt. Montauk mine, Newcastle, Cal., has returned from San Francisco.
 R. D. CHUTE has returned to the Rappahannock mine, Rawhide, Cal., from San Francisco.
 R. E. HANLEY, Supt. Niagara mine, French Gulch, Cal., has returned from San Francisco.
 JAS. CRONAN has returned to Hackberry, Ariz., to take charge of his mining property there.
 E. C. VOORHEIS, Gen. Mgr. Lincoln mine, Sutter Creek, Cal., has returned from San Francisco.
 W. B. MURDOCK returned to the city Tuesday from an extended trip in Nevada and Sierra, Cal.
 J. J. MACDONALD of the Gold & Silver Extraction Co. of America, Denver, Colo., is in San Francisco.
 R. L. DUNN has returned to San Francisco from a mining exploration tour through southeastern Alaska.
 J. J. CRAWFORD of San Francisco has returned from a visit to the Gwin mine, Mokelumne Hill, Cal.
 N. W. MOUNTAIN, Placerville, Cal., owner of the Independence mine, El Dorado, Cal., is in San Francisco.
 PROF. A. G. BELL, inventor of the Bell telephone, sailed from San Francisco on the last steamer for Japan.
 JNO. M. WRIGHT, attorney for the Kennedy M. & M. Co., has returned to San Francisco from San Andreas, Cal.
 T. J. PARSONS, San Francisco, Vice-Pres. Cal. State Miners' Association, is visiting his mine near Alleghany, Cal.
 C. B. WINGATE, managing owner Chloride-Balley mine, Dedrick, Cal., has returned from the mine to San Francisco.
 J. L. COLES, Gen. Mgr. and part owner Montauk mine, Newcastle, Cal., is spending a few weeks at San Diego, Cal.
 D. FRICOT has returned to Grass Valley, Cal., from a trip of inspection to his mining properties at Fricot City, Cal.
 L. R. POUNDSTONE, Supt. Oro Fino mine, Shingle Springs, Cal., is in San Francisco on his return from Pennsylvania.
 S. W. CHEYNEY, San Francisco, is inspecting the Mammoth Garfield mine, of which he is Gen. Mgr., at Whitehouse, Cal.
 On the 11th inst., at Jackson, Cal., Rossiter W. Raymond of New York occupied the M. E. pulpit and preached an able sermon.
 G. FLETCHER of Grass Valley, Cal., managing owner Reddick gravel mine, Nevada City, Cal., has returned from San Francisco.
 F. COREHILL, Supt. Dead Horse mine, Summerville, Cal., has returned from Hawthorne, Nevada, where he was recently married.
 RD. ROWLANDS of Placerville, Cal., is in San Francisco en route to examine mining properties for Eastern capitalists in Arizona.
 A. W. HAWLEY, a mine owner of Grass Valley, Cal., has returned from an inspection trip at the Oro Fino mine, Grant's Pass, Oregon.
 MR. SCHAW, of the firm of Schaw, Ingram, Batchelor & Co., of Sacramento, Cal., returns next week from a business trip to London, Eng.
 F. W. BRADLEY, San Francisco, Mgr. Bunker Hill and Sullivan mines at Wardner, Idaho, is in Seattle, Wash., on his way to the mines.
 W. H. STORMS, Supt. Agnes mine, Sonora, Cal., who was the associate expert in the Argonaut-Kennedy investigation, is in San Francisco.
 J. MELTON, Placerville, Cal., managing owner Brown Bear mine, Deadwood, Cal., and owner Gentle Annie mine, Placerville, Cal., is in San Francisco.
 M. MIERSON, owner Mierson Cons. Mines, Placerville, Cal., was in San Francisco attending the annual meeting of the California Bankers' Association.
 WM. VAN SLOOTEN and E. W. MORGAN of New York have returned to San Francisco from an examination of mining properties in El Dorado county, Cal.
 A. M. McDONALD, Supt. Kanaka mine, Groveland, Cal., has been nominated for the Assembly and has resigned as Supt. of the mine. He is succeeded by H. M. Stanley.
 EVERETT SCHWARTZ, the newly elected director of the Wilmerding School of Mechanical Arts at San Francisco, is at present principal of the Manual Training School at Waltham, Mass.
 DR. DAVID STARR JORDAN, Pres. Stanford, Cal., University, negatives any suggestion as to his acceptance of the presidency of the State University at Berkeley, Cal., which will be vacant March 23rd, '99.
 C. E. UREN of Grass Valley, Cal., is making an underground survey of the Pine Hill G. M. Co.'s property near Placerville, Cal. Mr. Uren has under consideration an offer from the Gold Hills Co. for the position of consulting engineer at Bulawayo, South Africa.

Is Darwinism True?

W. S. PROSSER.

NUMBER V.

The story of the horse, from the size of a fox or perhaps a kitten, to one of strength to bear warriors to battle; from five toes to that hoof incomparable for traveling the hard highways in man's service, gaining teeth, shape, speed, spirit, docility, so exactly fit for human needs, furnishes proofs, hardly to be equaled, that a firm and intelligent hand has guided and assisted all these changes to a destined end, and that chance was not the creator.

The weakness of the old creation theory, and that which made the opportunity for Darwin, was the assumption that each species must have been created *de novo* and independently, which involved many re-creations of those parts not new, and, hence, much unnecessary exertion of creative energy. Darwin jumped to the other extreme by trying to account for things by imaginary processes—miscalled natural—which explanation fails radically, because no process of nature can account for what is outside of nature, to wit: the introduction of new ideas and inventions; and also because the means and methods of evolutionary changes are totally unknown, and to call them "natural" explains no more than if they were dubbed "x-y-z" processes.

The truth lies in the middle. Later species descended from earlier, by natural generation, in so far as the same parts and organs were continued; but the new parts, or new arrangements, were invented and built by an intelligent outside power. (The name of that power is an entirely different affair.) And this introduction of new ideas could just as well have been gradual, as instantaneous. Better, as being in accord with natural processes everywhere. This view is strengthened by the history of all living species and their ancestors.

From the earliest to the latest forms there is a steady and continuous change along lines which must be fixed, because they are never overpast, clearly indicating a controlling mind, working to a predetermined end. Variation by chance, even if possible, as it is not, would ramble back and forth, now here now there, ending nowhere. A ship runs from port to port only if it has a helm and a hand on the helm.

If all animal forms were derived by natural generation and chance variation, there could be no assurance of a unity of design throughout, nor of an unbroken series of forms from least to greatest. Whereas, if lineally derived under an actively controlling mind, such unity and unbroken series would be practical certainties, as we have seen them actual facts. It has been urged by a high authority that nothing could be substituted equal to the idea of common descent as a working theory. The present theory, as it contemplates ancestry, though controlled, ought to have the same value for working purposes, and, if it be true, ought to be of higher value.

A theory of some kind seems necessary to give system and enthusiasm to scientific work. The theory of natural selection of Darwin and Wallace was so superior to the lame former explanations, and so ably supported, that biologists were carried off their feet, and believed that all was explained. Afterwards doubt crept in. Some anatomists, especially American, found what they considered proof that "variation was determinate"—according to a fixed plan—which contradicts any variety by chance. Both cannot be true. Chance is like the explosion of a shell, in which the fragments are hurled in every direction; the farther they travel the more apart they become, and the less resemble a system. Determinate variation flows steadily within its limits, like a river in its banks, to a fixed and destined end. It would seem almost certain that chance variation, if possible at all, as it is not, working for ages, would present to us now a heterogeneous collection of freaks, without order or intelligible system, far remote from the nice

series we see, from the microbe to the mammoth. There are thousands of possible variations. What disadvantage in the struggle for food would a grass-eating animal with two heads have? or a horse with extra tail on each side to keep off the flies? or a deer with wings to assist his running, or with extra ears and eyes to warn of danger? These fancies may seem grotesque, but they, or others far more extravagant, must have resulted if chance ruled evolution.

(To be Continued.)

Platinum in the Ural Mountains, Russia.

In Russia platinum working is free from all taxation; and as the government monopoly of refining, which was kept up for a time, has been abandoned, the product is mostly placed on the London and Paris markets, and there controlled by one or two individuals.

In working the alluvial gold deposits, two methods are followed. In the first, the plant and apparatus are provided by the ground owner, who hires labor and directs the operations either personally or by deputy; while in the second, a system of tribute is followed, the ground being let to free laborers or starateli, who provide everything necessary for working and deliver the product at a fixed rate to the proprietor. This price may vary, according to the difficulty of working, from \$9 to \$10.50 per ounce; but in all cases the prime cost in the proprietary workings is higher than in those of the free laborers, who are able to handle, with a profit, material with but from eight to ten grains of gold per ton. Platinum sands are considered poor when containing less than forty-five grains of the metal per ton and rich when above 180 grains. The lowest profitable limit seems to be about thirty-nine grains. The platinum workings of Avorinski are at present the most important of that class. The deposits, from 13 to 16 feet thick, lie upon a conglomerate of serpentine, and are covered by nearly 80 feet of barren material; they extend for about 1½ miles, with a breadth varying from 70 to 250 feet. At Avorinski the average yield is about eighty-seven grains of platinum minerals per ton; but in places it goes up to twenty, thirty or even fifty times as much. The working is entirely subterranean, but open, small pits 70 to 80 feet apart being sunk to the deposit; and the material, drawn to the surface by windlasses, is washed in the ordinary Siberian frame at the mouth of the pit. About 400 hands are employed, the work going on night and day. The crude platinum contains about 1 part in 4000 of gold, which is separated by amalgamation and washing with water in large capsules. The final product contains 90 per cent of platinum. Besides the platinum found from Gora Blagodat, not far from the Isa river, to Nijni Tagilsk, a distance of over fifty miles, it occurs also near Miask, more than 100 miles farther south. But here only about 1200 ounces are obtained annually, while the yield of the entire Urals is about 55,000 ounces. The platinum district of Isa river and its tributaries is worked by the Government and by a number of private owners jointly with the Government. The platinum is whiter than that of any other district, whereas that from the Demidoff estate in the Martian range, farther south, has always a rusty appearance.

THE more accessible portions of the globe having been explored, geographers are now correcting their imperfect records. Text books and the latest maps represent the Arctic coast of Siberia as a flat, water-soaked tundra, but this, Dr. K. Hikish has just pointed out to the Russian Geographical society, is decidedly wrong. Only in the region of the Obi has the Arctic low, flat shores. East of the Yenesei to Bering strait, as early explorers knew, the coasts are high, and in the east of the Kolyma even hilly, and there are only deltas at the mouths of the Olenek, the Lena, the Yana and the Indighirka.

Electric Smelting.

It appears that the Americans are likely to lead us once more in the matter of electric smelting. Europe generally does the research work, but America is usually the first to adapt the discoveries which are made to the practical business of life. At Niagara some improved furnaces are now being laid down. These are large cast-iron drums, and resemble in appearance the spool upon which cables are wound. On the outside peripheries iron plates can be clamped, and these serve to keep in the ores which are to be reduced. The drum is mounted on a shaft, and can be slowly rotated by suitable gear. The electrodes are carbons fixed side by side, their points touching an imaginary line drawn horizontally through the axis of the furnace. The heat due to the resistance of the ore is, of course, developed between these two points, and, as the ore is reduced, the resultant metal lowers the resistance of the furnace, and the amperemeter rises. When this occurs the furnace is slowly rotated, and by this movement the metal is drawn down away from the electrodes and fresh ore is also brought between them to be acted upon in like manner. The reduced ore cools within the furnace, and can be extracted cold at the other side of the drum after moving the clamped plates. The adjustment of the furnace is to be automatic, a small motor controlled by an ammeter rotating the drum and keeping the current constant. This furnace is the outcome of elaborate experiments, and, judging from the results which the author of the paper describes, we should expect great things from it.—London Electrical Review.

The Fatal Blue Point in Working Iron or Steel.

One of the technical niceties required to be observed in boiler work for United States naval use is the prohibition of blue working without subsequent annealing. The fact is interesting, as explanatory of this rule, that what is known as a critical temperature in the working of both iron and steel is at the so-called blue heat, this being from 450° to 600° F., and it is here that iron and steel are much more brittle when cold or at redness. On iron, however, this heat does not seem to leave any bad effect, though, if the piece be worked in such a range of temperature, it will retain the brittleness after cooling and show a great loss of ductility as measured by the bending test, and the poorer the iron the more susceptible it is to the blue heat. The danger to steel at this fatal blue is more pronounced than in iron, but it exists to a greater or less extent in all iron of whatever grade, is also more noticeable in a descending than in an ascending heat and is especially marked in work having sharp corners, which has been worked at the blue heat.—Blacksmith and Wheelwright.

IN glancing over the mining field of this country it is perfectly apparent that those regions which have had the most assistance from capital of late years are the greatest producers. Take, for instance, Colorado and Montana, which head the list in the matter of bullion production. They are both very prosperous States from a mining point of view, or would be if silver commanded a fair price, and they are the two regions which have been best backed up by capital. Butte had the advantage of having very good men to give it a start, and very good mines, too, for that matter. But none of the mines were developed to any great degree until capital took hold of them. It takes money to make money in mining as in other things. Colorado, being comparatively near the Eastern centers of capital, had had great assistance, and its mines are doing wonderfully well. Arizona, New Mexico, Oregon, Nevada, Idaho, Washington and even California have not for a long time enjoyed the advent of any large amount of capital for investment in mines. They have had to get along as best they could. Of course, in time all

this will be remedied. Mining is now considered more of a legitimate business than formerly, when all mining investments were considered speculations. "Stock board" mining is in decadence in these days. People are going into mining for the mines themselves, and it is a good thing to do, for there is plenty of room for investments of this kind.—Clancy, Mont., Miner.

PROFESSOR TILDEN, in his address at the Royal Institution on "Recent Experiments on Certain Chemical Experiments in Relation to Heat," said:—If we try to think what is going on in the interior of a mass of solid when it is heated, the work done is expended not only in setting the atoms into that kind of vibration which corresponds to a rise in temperature, but partly in separating the molecules or physical units from one another, and partly in doing internal work of some kind, the nature of which is not known. Metals dissolved in metals are generally monatomic. It is, moreover, remarkable that although in respect of specific heat each element is a solid seems to be independent of the rest with which it is associated, when the separate atoms like mercury, some in groups of atoms, and these groups, as the temperature is raised, are simplified with very varying degrees of readiness. Sulphur vapor, for example, diminishes in density from 7.9 at 468 deg. to 4.7 at 606 deg., and iodine from density 8.8 at 253 deg. to 5.6 at 1570 deg., while with mercury there is no corresponding change. But although these groups are taken as the chemical molecules, the physical unit in the solid is certainly the atom, whether united by combination or mere admixture.

THE plan of traveling by tunnel to the center of Mont Blanc, and then taking an elevator for a vertical ascent of a mile and a half to the summit, is an amazing one even in these days of great works. A French engineer, M. Paul Issartier, proposes a tunnel 18,864 feet long, to terminate at 7500 feet above sea level, after a rise of 600 feet in its length, and from this a vertical shaft, 10 x 13 feet in size, to the summit, 8200 feet above. The excavating would be done from below. A strong, two-storied steel chamber would be raised on steel racks at the corners of the shaft, the upper floor carrying the compressed air drills and the lower one being provided with rock-crushing apparatus, and the rock blasted out would be caught on steel gratings, pulverized, passed to the bottom of the shaft in a 12-inch tube, and then washed away in a stream from centrifugal pumps. Before making a blast the chamber would be rolled to the other side of the shaft.

THE recent announcement of the discovery of new gases in the atmosphere has elicited considerable discussion. Prof. Berthelot calls attention in the *Comptes Rendus* to the fact that the green line of krypton almost exactly coincides with the green line of the aurora spectrum, and suggests that the element should, therefore, be called eosium. Dr. Arthur Schuster in *Nature* shows the spectrum of metargon to resemble closely that of carbon plus that of cyanogen. In replying, Prof. Ramsay recognizes the great similarity, but produces evidence which seems to render it very improbable that any form of carbon could be present, as the metargon spectrum remains the same in spite of every effort to remove any possible carbon present either as an element or a compound.

THE element calcium is generally described in text books as a yellow metal. This color is evidently due to impurities, as M. Moissan has recently obtained pure calcium in the form of brilliant white hexagonal crystals. The crystals were obtained by dissolving the metal in liquid sodium in a low red heat and removing the sodium by means of the cautious use of absolute alcohol. Calcium can also be obtained by the electrolysis of fused calcium iodide. Each of these methods yields a metal over 99 per cent pure.

Mining Summary.

ALASKA.

The Alaska *Miner* says that at Sunrise City, Cook Inlet, on California creek there are ten men working, doing fairly well. On Cow creek Williamson & Co. are putting in hydraulic machinery. They have ten men at work and the ground averages 50 cents to the cubic yard. Beedy Bros. have sold their Bear creek hydraulic plant and mine to Mr. Sleeper of New York for \$15,000. O. Riley, the discoverer of Bear creek placers, takes out all the way from \$10 upwards a day to the man and employs three men. On Six Mile creek there are thirty-five men working. W. T. Wybel of Bakersfield, Cal., has a hydraulic plant partly on the ground and the remainder will be taken in on the snow this winter. The Colorado Con. Co. have ten claims on an ancient channel which, it is said, averages 55 cents to the cubic yard. On Canyon creek junction of East Fork three men are said to average on one of the claims \$25 a day to the man, pumping and shovelling into the sluice boxes. The Polly Co. at the mouth of Mills and Canyon creeks have eighteen men at work shovelling in. There are about 600 men working in the district altogether. One sale by South & White on Lynx creek of \$50,000 is reported. This is a hydraulic proposition and employs eighteen men. There are several placer claims being operated near Juneau. On McGinnis creek States & McCully have acquired 320 acres of placer ground.

The steam schooner Excelsior, arrived from Copper river, brings 200 prospectors who failed to find gold. They report that the gunboat Wheeling will bring down 150 destitute men from Copper river.

ARIZONA.

(Special Correspondence.)—The Copper King Co. has bought the Barrett & Fetts property, and have ore at Solomon Springs to haul up to the Barrett Smelter.

Bisbee, Sept. 15th.
The Nyack Mining Co.'s copper mines near the Grand Canyon of the Colorado are turning out ore carrying 60 per cent copper with an average of about 18 per cent. The railroad from Williams to the mines will be started next month and is expected to be completed by December. A smelter for treatment of the ores has been erected at Williams.

Three carloads of machinery arrived at Thomas last week for the Spenszuma Co. The smelter will have a capacity of 500 tons per day. The copper properties of Twin Buttes are producing good ore as development proceeds. At Silver Bell the smelter continues to produce its daily quota of copper. Mgr. Wores of the Tucson sampling works says that the mining interests tributary to Tucson were never more promising than now, and that the chlorides are increasing steadily, and shipments to the sampler are satisfactory in quality and quantity. Mining in the Pima district is experiencing increased activity as the cool weather sets in. The Helmet Peak mines are being prospected by a tunnel. The ore is high grade silver with a good percentage of gold. The owners of the Little Jessie mine in Chapparral gulch, Yavapai county, will erect a 200-ton cyanide plant. The Temple Bar M. Co., operating on the Colorado river sand bars in Mohave county, has bought the interests of Redman & Co. for \$15,000. The Old Boot mine, in Silver Bell district, Pima county, is turning out three tons of copper bullion daily and employs thirty-five men.

The old Red Cloud mine, in Silver district, Yuma county, made a shipment of ore that yielded good returns. This property has lain idle for years until recently. T. Creighton, of Los Angeles, is pleased with his mines near Springfield in Yavapai county and will erect a mill upon them. Jones & Co., of the Little Jessie mine near Prescott will erect a 200-ton cyanide plant. Work has been started again on the Planet Saturn properties in Yavapai county. Development work to the extent of 2000 feet will be pushed to open out the mine and determine its value, when machinery will be erected to work the ore. In the Copper King camp in the Dragon mountains, Cochise county, the company is sinking three wells in the canyon and also has a dam. A mill is being erected on the mines of the Ardath Co. near Wickenburg. The Swindler mine in Big Bug district, Yavapai county, is being developed by E. B. Gage of the Congress mine under option.

To the Boston News Bureau one closely identified with Arizona copper properties says: There are four large copper-producing properties about which very little is heard, for the reason that they are either close corporations or owned by individuals. The first of these is the United Verde mine, owned by W. A. Clark of Montana, for which he paid \$23,000 and has recently refused \$30,000,000 from the Rothschilds. This property is creating \$10,000 a day net profit. The second and third properties are the Copper Queen at Bisbee and the Detroit Copper Co. at Clifton, owned by Messrs. Phelps, Dodge & Co.; and the fourth is the Arizona Copper Co., the control of which is owned in Scotland. Both the Copper Queen and Detroit companies are giving Messrs. Phelps, Dodge & Co. a profit of \$500,000 yearly and the Arizona Copper Co. is paying 12 per cent upon its capitalization, which amounts to several millions. The Arizona copper mines are preparing to double their production. The Copper Queen and the Detroit companies doubled their capacity last year and are now erecting sufficient machinery to again double their capacity. The Arizona Copper Co. is erecting a 300-ton concentrator and has given out contracts for two 150-ton furnaces which will be in running shape before the close of this year and this will double the Arizona Co.'s capacity. Present capacity of the Detroit Co. is twenty-five tons per day and of the Arizona Co. thirty-five tons a day. The stock of the Arizona Co. could have been purchased in London within the last four years

at 75 cents per share, to-day the stock is selling at \$50 a share. This company is working ore running as low as 3 per cent at a profit by concentrating and leaching. There are several other large producers in Arizona of which we hear but little. Arizona copper commands the same price in most instances as Lake copper. The ore does not have to go through a roasting process, however, for the ore is mostly all concentrating and free milling, and in view of this, low grade ore can be worked at a good profit, but it is not all low grade ore. The United Verde ore contains \$15 to \$18 in gold, and twenty to thirty ounces of silver to ton and runs 15 per cent copper.

J. Kasser effected the sale of the Marshall group of copper claims near Globe to the Live Oak Copper M. & S. Co. of New York for \$12,000 cash, in addition to \$1000 paid when the property was bonded. They have put twenty men to work. J. Kasser will be Supt.—J. W. Haas has sold his interest in the turquoise mines near Mineral Park, receiving \$5000 cash payment, balance to be paid in a few months. The purchaser is from New York City, whether he has gone with specimens.

The Azurite Copper and Gold Co. near Tucson has an abundance of water for the 30-ton water jacket. During the last thirty days they have been developing the carbonate body of ore and discovered that this is a blanket averaging from 6 to 17 feet in thickness, running under the surface from 5 to 50 feet. They can measure a body of ore from exposures made to run a 30-ton smelter for more than twenty years, and the deepest workings will not exceed 60 feet. All this body of carbonates, so far as developed, is confined to two of the eight mines of the Azurites. They also have a large body of ore uncovered on the Little Mammoth, the vein on the surface being over 50 feet wide. The grade seems good and carries gold. On the 300-foot level the breast of the drift is all in ore and of good value. The water question settled, the future of the Azurite is assured.

Enterprise: An English company has bonded the King of Arizona mine in Yuma county for \$2,000,000 and will at once sink to 500 feet. They are down 300 feet, and if the quality holds out to the 500-foot level the sale will be made. H. J. De Lamar has bonded the Maguire mining claim at Railroad canyon for \$30,000. Maguire Bros. have been running a dry wash machine on the claim and made money.

CALIFORNIA.

Amador.

The first clean-up of rock from the Oneida mine, at Jackson, averaged low; but this is accounted for, as the run was from a low grade boulder vein. The second run is being made of rock from the 1600 level, and is estimated to go \$25 a ton.

Dispatch: At the Anita, Jackson, the shaft is down 770 feet, the greenstone continuing hard. An average of 10 feet a month is made. At the Kennedy Supt. Parks is putting up a boiler and engine to run the mill, there not being sufficient water to keep all the stamps dropping. At the Lincoln mine, Sutter Creek, the shaft has reached a depth of 300 feet, and the work of retimbering and straightening is being well and carefully done under the supervision of E. C. Voorbies. One hundred and five feet was made last month, and the average is from 25 to 30 feet a week. In straightening the shaft a good deal of ore lying along the footwall has been taken out and will be hauled to the Zeila mill at Jackson. There are about 400 tons out now. The Argonaut and Kennedy companies, through their attorneys, have agreed upon a basis of damages to be paid by the latter for ores abstracted from the claim of the former. The issue unsettled between the companies is the claim of extralateral rights with divergent end lines of the Argonaut. M. Co.'s patented claim, disputed by the Kennedy M. & M. Co., on which the attorneys of the two companies will make their legal fight.

Republican: The crosscut from the shaft of the Balliol mine is in 135 feet and good rock has been found. This mine will be worked on a larger scale when water is plentiful. About 150 tons of ore from the Potasuba mine were recently milled at the Zeila and yielded \$3825, besides \$200 worth of sulphurets. This is equal to \$27 per ton. San Francisco capitalists are developing the Douglas mine in the Volcano district. The new shaft is down about 217 feet, and the old Sorocco shaft has been partly cleaned out. The total expenditure so far amounts to over \$20,000.

Record: The last twenty stamps at the Mahoney mill, Sutter Creek, closed down last week and not a stamp out of eighty is dropping at either the Mahoney or Wildman mines. One hundred and twenty-five men are laid off at both mines. Early rains are looked for for work to be resumed. A 10-stamp mill is being erected at the Allison mine in Plymouth district. The Bay State mine near Plymouth, which has been bonded by Stockton people, has begun unwatering the property.

Butte.

H. Francis of San Francisco has bought the Buchanan mine at Yankee Hill. This is an old time drift property on which work has recently been resumed, which under the new ownership is to be pushed by running a tunnel to tap the channel.

Sixty men are repairing the flumes on the big Cherokee ditch, extending from the Banner mine near Oroville to some distance above the Dogtown ridge. The work will be rushed. The English company which owns the Banner mine, near Oroville, will expend \$200,000 in deepening the shaft 1000 feet more. The shaft is now down 1300 feet, and has a 3-foot perpendicular ledge in slate, which runs from 7 to 8 inches in ore. Supt. Geo. Evans expects that the new shaft will develop the gold ledge to its full width.

Calaveras.

The Golden Gate quartz mine, near San An-

dreas, has been bonded to W. H. Clary & Son for \$7000, a partial payment advanced. Work at the Fellowcraft and San Andreas mines is progressing. It is intended to haul the ore from the San Andreas to the Fellowcraft and also to pipe water from the Ford mine to the Fellowcraft, where a reservoir will be built; and this, with water from the shaft, will supply five stamps. After a time a dynamo will be put in to run the mill and also to run trolley cars from the San Andreas to the Fellowcraft. The contract specifies that, within one year, a mill of twenty stamps shall be erected.

El Dorado.

(Special Correspondence.)—R. S. Raw has bonded the Gentle Zephyr and two other claims near Volcanoville, and is organizing a company for the continuance of development work. So far as the work has gone, it gives encouragement to the prospectors.

The Boulder M. Co., near Shingle Springs, is increasing the present 10-stamp capacity to twenty stamps and putting in an air compressor. The latter will be run by steam and the mill by waterpower.

Work at the Poverty mine near Placerville progresses. The new tunnel at 160 feet cuts the ledge at a depth of 600 feet. The ledge, so far as cut, is 6 feet, and the ore plates \$9 a ton. It carries about 8 per cent sulphurets that run over \$150 a ton. The 15-stamp mill will be finished in six weeks, and so soon as water can be obtained will begin crushing ore. This property is owned by J. Melton, who also owns the Gentle Annie mine near Placerville and the Eagle King mine at Grizzly Flat, both of which are working. Kelsey, Sept. 19th, '98.

Inyo.

H. C. Ratcliffe of Ballarat is at Los Angeles to transfer his one-half interest in a group of mines in the Panamint mountains to a company of Eastern and Los Angeles people for \$30,000 cash.

Kern.

There is considerable dry washing going on in the Stringer district. It is known that some are making wages, and some are getting \$5 and \$6 per day.

Randsburg *Miner*: The low price of hauling and milling ore is having its effect. The Wedge people will ship one car as an experiment, and, if satisfactory, will send in 1000 tons. The railroad people have put in a new chute for loading, and everything is convenient. The Eureka mill crushed four tons of ore from the La Crosse mine in the Stringer district which went better than \$150 per ton, the result of two men's work for one month. They are now working on twenty tons from the Napoleon, which will go above \$100 per ton. The cyanide plant at the Eureka mill is handling eight tons per day. This, with what the mill accumulates, will keep them busy for ninety days.

Los Angeles *Review*: Most of the mines in the Stringer district, which shut down during the hot weather, have resumed work. The cyanide plant at the Eureka mill, Randsburg, is in steady operation, and the results of the treatment are exceeding the expectations of the owners. The Eureka mill started on Little Butte ore, and will give it both a milling and cyanide test. The ore is from the 520-foot level and runs from \$17 to \$19 per ton, a little more than half of which is base. The Little Butte shaft is down 530 feet, and has a ledge of \$18 ore, whose width has not yet been ascertained. The Yellow Aster Co. shipped 1400 tons of ore to the Barstow Reduction Works during August, the ore going \$30 per ton. Dupuy & Swarthout of the Ophir mine, Johannesburg, have had two carloads of ore milled at the Barstow Reduction Works, cleaning up \$37.50 per ton.

Mariposa.

Near Coulterville on the 16th a premature explosion in the Mary Harrison mine killed G. H. Warne and J. Skewes, miners, and E. Felice, carman.

Mono.

Chronicle: M. Ryan of Bridgeport has sold his mines—the Arnot and Par Value—to an Eastern company, which is in possession and working them. There is an 18-inch ledge of good ore, the company having taken out ore which gave them a gold brick before they purchased.

Nevada.

(Special Correspondence.)—Supt. Shockley of the Phoenix mine at Nevada City started the new 10-stamp mill on a trial run and is well satisfied with its work. He expects soon to begin a steady run, as the ore is accumulating. This is another of the old time properties worked to only a few hundred feet depth and abandoned. It was known as the Sneath & Clay. The present company, composed of Cincinnati, Ohio, capitalists, unwatered the mine, did some development work and have been rewarded in finding a ledge of medium, average and fair grade. Nevada City, Sept. 20th, '98.

At the Gaston Ridge twenty stamps are running with good results. A 150 H. P. air compressor has been ordered and will be put in this fall.

H. W. Cole of Maybert is meeting with success in the development of his quartz claim, the McKinley. The tunnel is in 60 feet and shows a large ledge in a contact vein.

Good ore has been found in the 200 level of the Old Home mine near Blue Tent. The ledge is 12 inches thick.

A good ledge about a foot thick has been struck in the Maud S. mine near Nevada City. The property is being worked by Dower, Osborne & Co.

Placer.

At the Pioneer mine the dam is finished. Poles for wiring from the power house to the mill, a distance of 4000 feet, are set and the wire strung.

The new 30-foot vein at the Pioneer mine

runs \$6 per ton. The machinery for the electric plant is on the ground and the dam is completed.

F. Taylor uses nineteen pack mules between Towle and the Pioneer mine at Damascus to carry out sulphurets.

Plumas.

Bulletin: At Butte Valley A. N. Cameron is understood to be producing \$10 to the pick.

The Dunn Bros. are reported to be getting, with a 2-stamp mill, from \$300 to \$500 per week. V. B. Allen is putting a 10-stamp mill on his Bushman quartz mine, near Quincy. There has been considerable development done on the property.

Sacramento.

The Blue Ravine M. Co. is making extensive improvements on its mining property near Folsom. A hoist, steam pump and boiler are being placed. Work on the new shaft is progressing. Eastern capital is interested in the enterprise.

San Diego.

(Special Correspondence.)—A contract has been let for supplying 300 cords of wood for use of mine and mill in prosecuting further work on the Cincinnati Belle mine at Banner. Work is being prosecuted at the Helvetia mine and mill near Julian, the property being on the market for sale.

It is expected an increase of the working force at the Owens mine at Julian will be an event of the near future.

A few men are at work, of a preparatory nature, on the tailings of the Stonewall property, it being the announced intention to put in an extensive plant for their treatment and the employment of quite a force of men.

The Mountain View property, between Stonewall and Julian, and the Laguna Mining Co.'s property in the Laguna mountains, both good prospects, are dying for the want of activity or enterprise on the part of the companies who own them.

Mining matters are extremely dull in San Diego county.

Julian, Cal., Sept. 18th, '98.

Receiver Pauly of the Golden Cross mines at Hedges reports the output of bullion for August as \$43,000, of which \$23,000 was paid toward the indebtedness of the company. This makes \$190,000 paid off the past year.

At Venus Camp, Picacho district, H. W. Blaisdel has put in a mill and is crushing 100 tons of rock per day, and is also operating a cyanide plant of that capacity. Water is pumped from the Colorado river to the mines. There are seventy men on the payroll. The mines are well opened and large bodies of low-grade ore developed.

Shasta.

(Special Correspondence.)—The Distelhorst Bros., who have made a success of their dredging operations in the Sacramento river near Redding, are still operating, and with better success than at any previous time in their work. They completed a large windjam this season, and are operating with a large undershot wheel placed in the strong current of the river's channel, by which a hydraulic elevator is operated in the side channel; the dredger, lodged in the main channel, operates the scoop in the dry channel, and the output of gold is taken in paying quantities; in fact, the season has been profitable to a gratifying extent.

A second dredge is operating in the Sacramento river, built this season as a prospecting venture by a company from Michigan, known as the Mackinaw M. Co. They operate with a centrifugal pump and shovel, and work both upon the banks and in the channel. They raise on an average two yards a minute. Whilst their work and machinery have both been experimental, they have met with encouraging results. The same company is also doing development work in quartz properties in three different portions of the county—at Muletown, at Copper City and at Shasta. At Copper City they are opening five claims. The ledge as yet is small, but the ore mills \$38.12 a ton, exclusive of sulphurets. Their tunnel is 130 feet long and cuts the property at good depth. At Muletown they have five men working in a shaft. The work this company is doing is on a line of businesslike methods and thorough mining.

In the various directions that one may travel in Shasta county he sees prospectors at work, and the county has not shown such progress in the mining field in probably fifteen years as it shows at present.

In a portion of the Old Diggings or Buckeye, where for ten years mining received little attention, ledges are being uncovered of a paying grade of ore.

The National Con. Co., at Rich Gulch, is pushing to depth on an ore body of fair grade, from 3 to 5 feet wide, that carries a large percentage of good sulphurets, of which regular shipments are made to the Selby Smelting Works. The National has introduced electric power, and the entire plant shows good management in both mine and mill.

In the Whitehouse and also in the Kennet sections prospectors are laboring with encouraging results.

I am informed that the Mammoth, owned by S. W. Cheyney of Philadelphia, will put in a power plant to drive the tunnel, as the rock is very hard and hand work makes slow progress. From this property there is a bucket tramway across the Sacramento river to the railway, by which the ore is carried nearly a mile for shipment to Keswick.

In the French Gulch section, down to the Tower House country, old properties are being reopened and new ones being prospected.

About Whiskeytown, with a credited record of a heavy gold output in the long ago, where surface diggings produced quick results, work has begun, but not in the superficial way of olden times. Men now are working to depth, and with a knowledge of mining.

On Clear creek down to Shasta, for a radius of ten miles, more shafts and tunnels are seen

in which men are at work in a day's journey than one would hardly believe if he didn't see them.

The Iler Bros. have a group of nine claims, in which they have run one tunnel 900 feet, that runs 300 feet on a ledge of 4 to 10 feet wide, and at a depth of 400 feet they have another tunnel on ore. The ores in this property are partly base and some free milling.

The Hardscrabble hydraulic mine at Igo, which has not been operated since the Sawyer decision went into effect, is talked of as a possibility of being reopened soon. The property comprises 1700 acres; it belongs to the Dry Creek Fluming & Tunnel Co. of San Francisco. I am told that negotiations for its purchase are pending with Boston capitalists.

One cannot view the encouraging opportunities of mining in California, as he drives over those localities, without coming to the conclusion that companies making investments in Klondike could fare as well or better nearer home, under more favorable circumstances, with smaller investments and with comparatively equally good results.

Redding, Sept. 18th, '98.

The Anderson News says that the Marina Mariscano G. M. Co. will soon start up the Sunny Hill mine near Oro and ship the ore to the smelting works. This was one of the rich mines of Shasta county. It has been idle nearly five years.

Free Press: The 10-stamp mill at the National mine on Rich Gulch is using steam for motive power. The entire plant was formerly operated by electric power, but owing to the drouth the plant was unable to furnish sufficient water power, and now only the pump is operated by electricity. Water for steam purposes and for the batteries is pumped from the mine.

Sierra.

(Special Correspondence).—The Oriental mine near Alleghany City, owned by C. Heintzen, has been secured by Hill of Colorado under bond for a year. The price has not been made public. The mine has been idle nearly eighteen years. It was famous as a pocket producer, and it will be operated on this basis. The property was secured by M. W. Mather, Supt. of the Plumbago mine, which is also of a pocket nature. Mr. Mather will also have an interest in the Oriental. Both he and Mr. Hill have returned from San Francisco, where they bought machinery to be put at once upon the mine, which will be opened thoroughly and as rapidly as can be done. They pay cash as they buy.

Speaking of the Plumbago, I can say that for nearly a year work was carried on at a loss, but Mather, with business-like tenacity, having made a careful and thorough study of the geological structure and mine formation in the Plumbago, persevered, and within the last few months he came upon an ore shoot 80 feet long, from which he has taken over \$1000 a foot. His predilection in mine work is to delve in the pocket formations. With this idea in view, he bought the Hope mine last spring, near Alleghany, and now becomes interested with his son-in-law, Hill, in the Oriental. The 10-stamp mill on the Plumbago is in operation and the new power plant soon will be. This latter is being put on the banks of the middle Yuba, one mile from the mine and mill.

The Plumbago is owned by the Crosses G. M. Co., a New York corporation, and the Hope mine likewise.

Forest, Sept. 17th, '98.

It is locally reported that a strike of good ore has been made in the Buttes mine, at Sierra City.

Enterprise: The deal between the New York people and G. M. Pinney, owner of the Mountain mine of Sierra City, having fallen through, Mr. Pinney concluded to open the mine himself and a force has been put to work.

Siskiyou.

The Diestelhorst-Barton Dredger Co., operating on the Klamath river, has discovered a bar lying out of water that gives good prospects in gold. The ground cannot be worked until the rains have swollen the river so the dredger can be floated. The gravel deposit will then be worked by the usual method.

The Minnetta B. mine, at Nolton, is being put in ship-shape for winter. A new elevator will be put in at the Grider mine. This is the only mine on the Klamath river where piping is being carried on at present. The Eastlick and Wright hydraulic mines at Oro Fino are being fitted up for winter and putting in a new elevator. The Hollister Co., working the old Spencer mine on Humburg, now called the Golden Star mine, found a 2-foot ledge where the old company stopped work. This find has induced the company to pay the second installment and extend the tunnel 500 feet.

Journal: At the Greenhorn blue gravel mine at Yreka water is holding out and the mine is worked with success. The Chinese company working on Greenhorn continues operations by gaining a supply of water from bedrock. Frye & Macauley are putting up a quartz mill on Cherry creek; and, when completed, will crush quartz from Hunter's Cherry Hill mine. They have also bought the Ironsides quartz mine, which they intend developing. Jones & Daniels are getting out quartz from their mines in Quartz valley, all of which are paying well. Morrison, Carlock & Co. are putting up hoisting works at their mine in Quartz valley and employing a large force. The miners in the dry gulches and high bench diggings are making preparations to work their claims this winter.

Trinity.

The Cinnabar last week shipped 100 flasks of quicksilver. G. L. Bailey of Dedrick sold the Stanley-Helene group of mines owned by him to A. G. Hubbard of Redlands. Men have been put to work and the mine will be further developed and a milling plant erected.

The Golden Jubilee M. Co., near Trinity

Center, has its mill completed and has several hundred tons of good ore on the dumps, awaiting water. At Bragdon Moore & Saunders have uncovered a paying ledge in the vicinity of Trinity river, where they were fixing to work the bedrock for river gold. They have quit sluicing and are busy with their mortar. The rock lies between decomposed quartz and black slate. The ledge is 10 feet thick.

Tuolumne.

(Special Correspondence).—The Star mine, at Star P. O., is having its 10-stamp mill increased to double its present capacity. Steam power will be introduced. This property is among the productive mines of the East belt, on which for over fifteen years there is a line of producing properties.

The Bonanza mine, at Sonora, is building a steam hoist.

The Republican mine, near Jacksonville, records a strike of good ore. The shaft is about 150 feet, and in ore almost the entire distance. The vein is large. A steam hoist is being built. The property is operated by a San Francisco corporation.

From the Tuolumne river on the Mariposa side to the Stanislaus river on the Calaveras side, a distance of fifteen miles, there is an almost continuous line of productive properties. It is believed that this is the only instance of its kind in California.

Though the water famine has materially interfered with the gold output of this county this year, work has nevertheless been actively continued in all the properties unable to run the mills.

P. Geo. Gow has bought for the Jumper M. Co. the Golden Rule mine at Stent. This, though operated by the Scotch investors, will be worked separately from their other holdings in this county. The property had been worked in the early 60's and again in the 70's to a depth of 300 feet, and is said to have produced \$48,500. The mine was reopened in later years and much development work done. It has an adit level 525 feet long, and the main drift is about 1000 feet in length. It has a 10-stamp water power mill.

The Jumper Co. will add twenty stamps to its present milling capacity. The work has already begun.

Jacksonville, Sept. 19th, '98.

Though lack of water has compelled many of the mines to suspend milling operations, considerable development is being done where enough water can be obtained to run hoists. At the Norwegian group, in Jackass gulch, the chimney is being extended in depth with good results. The distance reached is 355 feet, 165 feet below where the horse was struck and work for the time suspended. The ore taken out will mill \$20 to the ton. The company recently received a patent to forty-five acres covering the apex of the hill.

Yuba.

The Postlethwaite dredger, operating in the Yuba river near Smartsville, will, it is locally stated, be operated by electricity, getting its power from the Yuba County Electric Co.

COLORADO.

BOULDER COUNTY.

(Special Correspondence).—At present Boulder mining operators are dealing largely in processes and new stamp mills. The new pyritic smelter of fifty tons daily capacity is nearing completion. The management has offered to purchase the entire output of the Dew Drop mine, Ward, for its smelter. Much interest is being taken in the success of the smelter and many mines will send their ore to it for treatment.

H. P. Walker has almost completed his chlorination mill of fifty tons daily capacity to treat the mineral from the Amalgam mine, Sugar Loaf. Water is pumped over the mountain 1000 feet from Boulder creek to supply the mill.

The Woody M. & M. Co. has built a pipe line one and one-half miles long from James creek over the mountain to the new mill at Jamestown. Preparations are being made to build the mill (chlorination) as rapidly as possible.

The Springdale 20-stamp mill is doing good work on the Standard ore. This mill started up three weeks ago.

The Delano mill and Kekionga mine, reported sold to an English syndicate a fortnight ago, have not started up under the new management. It is not definitely known when the property will be started. The mine is in good ore.

An air compressor costing \$8500 and two 80 H. P. boilers have been put in place at the mouth of the Adit tunnel, Ward.

Mgr. F. W. Davis is in Pittsburg, Pa., to meet the directors of the Ward Rose M. & M. Co. to make arrangements for placing machine drills to cut the Rose and Chief veins, which are in fine ore.

M. Cumberford, Supt. of the Dickens group of mines, Magnolia, is putting in air drills to push his tunnel 2000 feet under Magnolia mountain from Boulder creek. This will give a depth of about 1100 feet and pass through mineralized sections of undeveloped country.

J. Teagarden is taking out high-grade ore from the Wood M. & M. Co.'s claim and makes handsome monthly returns to the company. He has a well-equipped mill for treating his product, but is testing the ore by the several processes now in operation in this county and Denver.

The new Culbertson mill in Boulder is owned by members of the Colorado & Northwestern Railroad Co., and gets a large percentage of the ore mined here for treatment. The new railroad has given an impetus to mining in this section because of cheap transportation to the several mills and freight to the mountain towns.

Our county is looking prosperous and miners are doing well. WM. M. RULE.

Denver, Sept. 16th, '98.

The Worth mine lessees at Eldora shipped sixteen tons of ore that ran \$114.40 in gold,

seventeen tons ran \$67, sixteen tons concentrates that yielded \$115.80 and 140 ounces of amalgam worth \$7 per ounce. The Boulder mine, in the Caribou district, is shipping twenty tons of ore daily. The Eagle Bird mine, in the Caribou district, is taking out ore that runs \$280 in gold per ton. In the Hobson claim the vein carries 2 feet of high-grade smelting ore. Chunks of steel galena weighing 500 pounds, mixed with different forms of copper, are taken out, while other pieces show considerable polybasite and cerargyrite.

CHAFFEE COUNTY.

The new smelter, near Buenavista, is running to its full capacity of 150 tons a day on ore from Chalk Creek and Silver Creek districts. The principal shipping properties are the Mercur and Wood Tick, belonging to Missouri Pacific railroad people. The output is about forty tons a day of ore running from \$20 up. The Calumet mine, near Hecla, has started with fifty men. Fifteen cars of ore a day will be shipped.

CLEAR CREEK COUNTY.

The yearly output of the Dunderberg mine, at Silver Plume, is about \$80,000. The mine furnishes employment for nearly 100 men.

DOLORES COUNTY.

W. E. Hawley has secured a five years' lease on the dumps of the various properties of the Enterprise M. Co., near Rico. He will erect a mill shortly to cost \$10,000. The value of the ore is estimated at a high figure, as before the advent of the railroad in 1891 no ore could be shipped from the camp of less value than \$100 per ton.

EL PASO COUNTY.

Denver Mining Record: The ore bins at the Victor mine are filled and it is impossible to get cars sufficient to handle more than half the output of which the mine is capable. The ore is sent out in three grades. The low grade runs from \$20 to \$25 a ton, the second from \$50 to \$100, the high grade \$200 to \$250. The shaft will be put to a depth of 1000 feet, where a station will be cut, a pumping plant installed, and the vein tapped. In the Elkton each of the five levels is being driven, and every one is in ore. A production of 100 tons per day is maintained of ore averaging \$40. The net profit exceeds \$60,000 a month. The Modoc continues its large output. Five carloads of ore were sent to a local mill last week, and two carloads of high grade to the smelter. The lowest grade taken from the mine is five-ounce ore, and the general average of all the grades is placed at eight ounces. The Lafayette mine in August output 200 tons, ranging from one to sixty ounces in value.

Post: The gold output of Cripple Creek from 1891 to September 1, 1898, is \$47,182,797; the output from January 1, 1898, to September 1, 1898, is \$9,932,797; dividends paid since 1891 amount to \$6,432,144.94, of which \$1,825,525.50 have been paid in the current year. The dividends paid do not include profits distributed by private parties and mine owners. The average monthly dividends for the eight months of 1898 are \$214,578.

GILPIN COUNTY.

E. Steffen sold his one-third interest in the Star and four other claims near Central City for \$25,000 cash.

An enterprising miner at Black Hawk is making money shipping slag from the yards of the old mills at that place. Last week he shipped five carloads to Argo from the grounds of the B. & C. smelter. The Nicholls property on Maryland mountain will begin a steady output of ore as soon as the plant improvements are completed.

GUNNISON COUNTY.

The Maid of Athens mine near Pitkin daily ships a fifteen-ton car of ore.

LA PLATA COUNTY.

La Plata Mountains: (Special Correspondence).—The La Plata mountain region, while geographically a part of the San Juan country, possesses distinctive characteristics which separate it from the mountains of San Juan, San Miguel, Dolores and Ouray counties. The La Platas are almost an isolated region, perhaps twenty miles square, being cut off from the Silverton ranges by several ramifying affluents of the Animas river. In a similar manner are they separated from the Rico mountains to the northward by interlying hills and small streams. The peaks and ranges of the La Platas rise to an altitude of from 11,000 to 13,000 feet. From their heights is obtained a splendid view of the towering peaks of Mt. Wilson, near Ophir; Mt. Sneffels, near Ouray; Needles, near Silverton; and others near Telluride. Turning to the south-west is visible that grand panorama of the Mancos and Montezuma valleys, skirted by the vermilion-hued cliffs, where the unknown cliff dwellers dwelt.

The La Platas, as a group, are distinctly bisected by a rather deep, narrow valley, down which the little La Plata river flows toward the Mancos. At various points on both sides of this valley deep side gulches cut into the mountains, in most cases ending in an amphitheater-like basin near the mountain crests. These gulches contain the initial points for most of the exploiting for mineral, for along their sides are exposed the indications which lead to the discovery of precious lodes.

The important distinguishing feature of the La Platas is the character of their ores. When found in fissures, as in most cases, they consist of a tellurium-quartz with considerable free gold. When found in blanket contact veins, as in other cases, they consist of a gold-bearing pyrite, with considerable silver. The ores from the regular leads resemble the tellurium-sylvanite ores of Lake City and Cripple Creek. The rich tellurium ores are found in chutes and stringers. Where, as in some cases, the ledge between walls is 20 feet wide, the very rich ore is in narrow streaks; but the vein filling is more or less mineralized. Some of the best development in the La

Platas is found on the Columbus, located in a semi-circular basin, at the head of one of those side gulches above mentioned, at an altitude of about 11,000 feet. The property belongs to New York parties, comprising the Columbus M. Co. It is under the local management of S. R. Thompson, formerly on the Homestake at Deadwood, South Dakota. From a 200-foot shaft a crosscut goes to the vein. The main vein ranges from 2 to 20 feet wide, carrying streaks of tellurium ore. The product shipped, comprising about 160 tons per month, runs from 1½ to 5, 6 and 10 ounces gold per ton.

The Bessie G., on the opposite side of the range, is being worked by F. L. Freeman, who has thereon a three years' lease. This property was opened about sixteen years ago and is reputed to have produced about \$50,000. It is being worked through three tunnels, which go in on the vein, one above the other, and which are respectively 180, 200 and 180 feet in length, with upraises connecting the three. Between these levels much stoping has been done. The ores are a tellurium and free-gold quartz, some streaks of which are said to run about \$500 to the ton. It also yields some high-grade silver ore.

On the Valley King and Small Hopes are quite extensive developments, including a 200-foot shaft and 800 feet of drifts and crosscuts. The result is ore of the same character as is described above. This property is equipped with a bromine-treatment mill, which is not operating.

The Little Jane is being developed into a producing property by Pueblo parties.

The La Platas are reached by stage from Hesperus, a station on the Rio Grande Southern Railway, twenty miles above Durango.

WASCOOT.

La Plata, Colo., Sept. 16th, '98.

OURAY COUNTY.

At the Silver Queen on Bear creek a discovery has been made of a lead property which mill runs \$50 in silver and 40 per cent lead. Two carloads of ore have been shipped.

PARK COUNTY.

The Morning Star on Mt. Bross, worked under lease, has shipped several cars of high grade ore.

PITKIN COUNTY.

The mill of the Aspen Concentrating Co. is running night and day and giving satisfaction in the saving of values. Ore running from five to seven ounces in silver is being concentrated, and the value raised from \$35 to \$40 per ton. Two carloads of concentrates were sent to the smelters last week. The mines around Aspen are keeping up a monthly output of 12,000 tons, which is shipped to the different smelters of the State. A larger number of men is kept on the payrolls than since the slump in silver. The ores are high grade silver.

SAGUACHE COUNTY.

The Commodore at Creede is shipping 250 tons a day. The mine has recently been lighted with electricity.

SAN JUAN COUNTY.

In the Silver Wing mine at Silverton the tunnel is in 2000 feet and has a 15-foot body of ore that will average \$15 per ton in gold. They are taking out enough to keep their twenty stamps dropping. They will keep the concentrates until spring.

At Silverton the Tom Moore mine is shipping three carloads of ore a week; the Blizard is shipping two, the Great Eastern three, the Dick Bland two and the Hamlet one carload. Livingston & Donovan are working the old Cape Hatteras, which has been developed by 300 feet of tunnels and drifts. They are taking out good shipping ore. Considerable ore is being taken from the Occidental. The stuff is being piled on the dump to await the construction of a mill.

SAN MIGUEL COUNTY.

(Special Correspondence).—The Suffolk mill at Ophir, Colo., leased to Thomas & Real, handles an average of about fifty tons of ore per day, most of which comes from the Suffolk group of mines, which are worked by lessees. These ores are partially free milling, a part of the saving being in the concentrates.

In Turkey Creek basin, 2000 feet above the railroad at Ophir, the San Juan G. M. Co. are completing a new mill on their Bessie mine, which has large ore reserves in sight. These ores are free milling quartz, with some sulphurets. The mill equipment consists of crushers, rolls, Huntington's and a large roaster, all to be run by electric power. By means of the roaster it is designed to desulphurize the ore. To facilitate the work a crosscut tunnel is being driven, through which the ore will be conveyed in cars from the mine to the mill. Adjacent to the Basin is the Gold King group, worked through a tunnel that cuts through the mountain to the Ophir side. The latter operates a mill.

Sept. 17th, '98.

WASCOOT.

The Meldrum tunnel, piercing the San Juan range between Telluride and Silverton, is in 1000 feet on each side of the range. When completed it will be about four and one-quarter miles long, and its greatest depth will be 3426 feet. It is 12x12 in size and will cost \$2,000,000. It is expected to take out enough ore to pay expenses. It will furnish transportation for 100 mines and save over a 100-mile haul between the different cities now connected by 120 miles of rail.

SUMMIT COUNTY.

From the Kokomo district the Wilfley mine is shipping six carloads of \$75 concentrates per week. The White Quail is shipping four carloads of high-grade ore weekly.

IDAHO.

At Wallace the tunnel on the Cincinnati group is in 600 feet. The Granite M. Co. began dropping five stamps on ore last week and will start the other five as soon as there is water enough for power. C. Cunningham has taken a bond on the Gettysburg group at

Mullan has six men working.—At Saltese the Eclipse M. & M. Co. owns 25 claims. On the Kearsage 3 feet of ore runs 25 per cent lead and 140 ounces in silver. Four carloads of it have been shipped. On the Shakespeare 5½ feet of ore have been cut, running twenty-five ounces in silver, \$3 to \$5 in gold and a little copper. The headquarters of the company are in Spokane, and it is said to be their intention to put in pumps and hoists as soon as possible, and put on twenty-five men before the end of the month.

F. R. Reed has a second placer mining enterprise under way on the Boise river. The company will be known as the Josephine Placer M. Co., with F. R. Reed Pres. and Gen. Mgr., and W. R. Lindsay Supt. The property is sixty-two miles from Boise, embracing 540 acres of the high bars, which have been demonstrated to be valuable. The ditches are completed and the pipe and six giants will be put in place this fall. If the weather keeps open, a run will be made this season, but everything will be in readiness for mining in spring.—The Lucky Boy Co. will soon put up three 2-stamp mills. A force is at work laying the pipe line.

At Mullan work will begin on a new mill for the Hunter and on further development work in the mine upon the return of M. Curran, for several years Supt. of the Hunter, who has gone East. The company has agreed to either build a mill and open the mine, or give Mr. Curran a long-time lease on terms which would justify him to build.—Two boilers, weighing 20,000 pounds each, were taken to Moose Creek for the dredge boat built there.

Near Murray the Granite M. Co. has started its mill, but owing to a scarcity of water only one battery of five stamps is operated.—H. M. Glidden has bonded the Hobson's Choice claim at Buffalo Hump for \$33,333. This is one of the first locations in the camp. The ledge is large and crops for nearly 1000 feet. It is a contact vein between granite and schist. Glidden will at once put a force to work.

The Lucky Boy of Custer shipped gold bars amounting to \$3650, the result of a few days' run.

Statesman: The Friday mine at Pearl, owned by J. C. Hill and bonded to B. F. Parish six weeks ago, has proven so satisfactory that the bond was taken up. There is on the dump about 100 tons of ore waiting sorting for shipment.—The Checkmate mine has the shaft sunk over 100 feet. The mine is working three eight-hour shifts, crosscutting for the ledge at the 100-foot level.—McDougal & Pollock are working on the King mine, and so soon as the contemplated concentrating works are in operation it will be a producer.—Soderberg & Co. of the Challenge mine are driving a crosscut to tap the ledge at 250 feet. They cut a ledge that mills \$80 a ton.—B. Hall is milling ore from the Nellie Fraction that runs \$100 per ton free gold.—R. H. Robb has opened a body of coal that is 5 feet thick. There has also been a large body of lignite opened up by a 140-foot drift near Pearl. Nearly all the families and hotels in Pearl are burning this coal.

Lewiston Tribune: J. G. Richey recently bought the Big Bar placer mine on Salmon river and the ditches, flumes and water rights of the defunct Big Bar M. Co., and has organized the Salmon River G. M. Co., composed of Denver, Colo., capitalists. The company will immediately construct a ditch and pumping plant. The Big Bar has puzzled mining men for thirty years. It consists of a deposit of gold-bearing granite 67 feet deep, overlying a pay streak 7 feet thick that carries nearly \$2 to the yard. The engineering difficulties have been to strip the pay streak of this deposit. The mine will be in full operation before winter.

MONTANA.

The Big Seven mine at Neihart employs forty men and takes out five tons of high grade ore daily. The main tunnel is in 1750 feet and forging ahead. It has cut through an ore body 850 feet long, one 100 feet long and is entering into a third. The ore is high grade sulphuret of silver and carries some gold.—The mill at the Montana mine near Twin Bridges started this week. The Montana mine has had a varied experience since its discovery fifteen years ago. Good ore has been found at different times and the mill has dropped stamps, but without returning hardly expenses. The group consists of four claims and is owned by Eastern capitalists, who until two years ago did no work except the representing. About that time twelve men were put to work, and considerable ore run through the mill, but only a small per cent saved, which it is understood, with the improved machinery put in, has been remedied.—Stevens & Co. at Barker are shipping two cars a week. They are also running a tunnel on the Equator.—J. Kitto has added a table to the North Home mill at Townsend and is running through 300 tons of ore from the Bob Lee.—Easterley & Sons of the Hard Cash are taking ore from a 14-inch streak which goes \$120 to the ton.—Eight hundred tons of second-class ore have been shipped from the Moulton at Barker by the smelter company since it commenced leasing the second-class ore of the mine. The new 1100-foot tunnel is completed.

Interviewed as to the truth of the reported closing down of the Anaconda mine, Marcus Daly, in an interview with the Butte Inter-Mountain, says the report is not even worth a denial. That paper says: Never for fifteen years have the Anaconda properties been in such splendid shape as they are now, and never was the prospect of continued operation brighter. While copper commands a good price, as it does now, all the copper companies believe in working to their full capacity. The operations of all the companies are characterized by remarkable activity, and there is no thought of restricting the product while the market continuously demands more of the red metal at constantly increasing prices. The

Butte mines output this year will approximate \$35,000,000, of which amount three-fourths is kept in the State to pay for labor and supplies. Not one of them has yet reached a depth of 2000 feet.

NEVADA.

At Candelaria a special meeting of the stockholders of the Holmes M. Co. has been called for November 23d to vote upon a proposition to create a bonded indebtedness of \$175,000.

J. Diem and associates of Park City, Utah, are developing a property near Tuscarora. They have opened three veins and the ore runs \$30 a ton. They have a 10-stamp mill running.

About 340 tons of ore from the Bounce mine, at Douglas, were milled and yielded \$19.10 per ton. This is the result of thirty days' work by five men in the mine. They are down 350 feet and the ore is good grade.

Operations at the iron mines near Lovelock continue. About sixty men are employed doing assessment work. The surveyors have finished their work for patent.

THE COMSTOCK.

Last Saturday there was a special meeting of the general committee on drainage and deep mining, composed of two directors from each of the twenty-four Comstock companies. At that meeting the report of the committee (published herein in the issue of the 17th) was endorsed and a pumping association formed, composed of the presidents of the several mining companies who engage in the project. The members of this association are to work without compensation; the endeavor will be to pump out all the water in the workings below the level of the Suto tunnel; that each level, after being unwatered, be thoroughly prospected; that all necessary machinery and power be secured by the association. It was determined that the boards of directors of the various companies aid in every way in their power to carry out the plan, an important feature being a proposed pro rata agreement to pay what all the above costs, the money to be raised by assessments, company stocks that won't or can't stand the assessments to be virtually pledged to pay their share later on. It is not desired or intended that this last should result in the stronger companies standing all the expense and the weaker companies sharing in the benefit; the central idea is mutual co-operation—a small preliminary assessment all round providing enough money to at least make a start, relying upon the strength developed in the stock market by the favorable developments on the lode to insure a satisfactory basis for further assessments as the work progresses and more money is needed. It is argued that the public will stand assessments for deep mining when they would not contribute anything with a prospect of having money applied to salaries, milling, etc.

The pumping association's officers are C. Hirschfeld, Pres.; A. Waterman, Sec'y; G. McM. Ross, Supt. It is estimated that the first expenditure necessary will be about \$100,000 to put in the requisite pumping plant and operate it for sufficient time to permit of the uncovering of good ore long known to exist. It is figured that were the Con. Cal. & Va. to contribute a pro rata of 15%; the Hale & Norcross, Potosi, Savage, Chollar, Sierra Nevada, Gould & Curry, Best & Belcher, Union Con., Mexican and Ophir each 7½%; Belcher, Crown Point and Yellow Jacket 5%; Caledonia, Alta and Confidence 1½%; Con. Imperial, Justice, Con. New York, Bullion, Utah Con., Alpha Con., Challenge Con., Overman, Exchequer, Seg. Belcher, Mides Con. and Kentuck Con. 1%, sufficient would thus be secured to begin on the basis proposed, with a small reserve fund. Several of the companies have already formally agreed to furnish the quota indicated above, and it is probable the financial preliminaries will be so far advanced this week as to justify the association in taking further steps to hasten the beginning of the work.

During the month the thirty-two Comstock companies have reduced or will reduce their capital and the rate of par value of their shares of stock. The Overman and Yellow Jacket reduced by reincorporation. This week the Ophir and Best & Belcher reduced to \$3 per share; the Savage, Con. Cal. & Va. and Union Con. to \$2.50; the Alpha, Utah Con. and Bullion to \$1 each; the Occidental, Sierra Nevada, Gould & Curry, Mexican, Chollar and Potosi to \$3 each; to-day Justice and Kentuck will reduce to \$2 and \$1, respectively; and next week Crown Point, Confidence, Caledonia, Challenge and Belcher will reduce to \$3; Julia, Exchequer, Silver Hill, Con. Imperial, Con. New York and Lady Washington to \$1; and Alta to \$2 per share.

NEW MEXICO.

The sulphur mines in Guadalupe county are being rapidly developed, and one, of which A. A. Chateau is Mgr., is putting in a furnace capable of reducing 100 tons of ore daily.—The Hematite mill, at Red River, has been sold to Longdorf & Co. and will start up without delay.—The Insurgent, a new silver ore producer near Hillsboro, has a vein 15 inches wide and assays fifty to sixty ounces a ton.

A big strike is reported at the Philadelphia mine at Hanover of an ore body 7 feet wide, averaging 26 per cent copper and 26 per cent iron.—One hundred and twenty sacks of ore shipped by the Opportunity mine, Hillsboro district, netted \$840; while a shipment of first and second class ores netted over \$1000.—The Wicks mine in Sierra county has sunk a new shaft 90 feet below the 300-foot level. The ore assays \$58 and \$76 in gold.

OREGON.

(Special Correspondence).—Indications here favor rich gold mines in the immediate vicinity, judging from the amount of development work being done. Scarcely a day passes but there are from one to three parties of pack animals loaded with provisions for the different mining claims. New hoists are being put

in place, dry wood is scarce, covering for buildings is being inquired for, and rope tramways are being constructed. The 20 stamp mill is running full capacity and there are no idle men in town. About forty jacks came in last evening to pack ore from the higher altitudes. Mining men looking for investments might be satisfied if they saw the different mines with their values in sight.

JAMES RUSTLER.

Cornucopia, Or., Sept. 15th, '98.

The past thirty days La Bellevue mine shipped upwards of 30,000 pounds of concentrates from Baker City.—The Climax in the Cracker Creek district, owned by Grayson & Bishop, makes a good showing at a depth of 700 feet. The ledges are from 5 to 12 feet in width. The ore runs from \$10 upwards.

The Red Boy has been equipped with a 20-stamp mill at a cost of \$40,000. A large amount is on the dump.—The Eureka & Excelsior mine has been put on a producing basis, and employs 120 men. The mine has produced to date \$1,400,000 of bullion.—Among the new properties developed near Sumpter is the Golconda mine, they are erecting a new plant at a cost of \$50,000. Seventy-five men are employed.

The Forest Queen placer mine, near Grants Pass, was bought last week by G. W. Seeley of Aramona, Cal., and M. J. Seeley of San Francisco. There are three ditches and a reservoir, 1400 feet of flume and 1000 feet of pipe on the property; the new owners will begin work immediately.—Boneau & Mohr bought the Free and Easy mine in Josephine county for \$10,000 and will commence work on it on a large scale.—The dredger at Tolo has begun operations and works well.

Fifty men are at work at the Keady mine, near Baker City, owned by Bement Bros., of Indiana. A 2000-foot tramway is completed from which the quartz will be hauled to the mill, three-quarters of a mile.—Two concentrators are being put in at the Eureka Co.'s mine on Soldier creek, Josephine county, formerly known as the Denver city. It has produced considerable bullion.—The Browning-Hannum mine, near Grants Pass, at a depth of several hundred feet has a vein 3 feet wide of good grade ore.—Stalker & Davis, near Brownstown, made a strike in a locality that had been mined as far back as 1852 and has been mined over and over since. In June, Stalker & Davis landed in Brownstown, and struck their shovels in the hills above the old town where they exposed a high channel never before touched and in a few days took out twenty-eight ounces of channel gold.

Journal: E. B. Jennings of Table Rock has sold a three-fourths interest in his quicksilver mines to Folger & Molander. The conveyance embraces 260 acres. The ledge has been developed by a 100-foot tunnel and a 75-foot shaft, and it is said to be 100 feet in width. The purchasers are said to represent English capitalists, and it is their purpose to at once develop the property on an extensive scale.—The thirteen-mile ditch which has been under construction on Grave creek for the John C. Lewis Co. has been finished. The two ditches together are about twenty-eight miles in length.—Work on the Greenback mine near Leland under the new management is being vigorously pushed. The men who have the mine under bond are E. Smith of Denver, W. J. Carton of Bland, N. M., and W. H. Brevort of New York. F. T. Sutherland is in charge of the work. The old tunnel is being pushed by night and day shifts; the men are working 170 feet under the surface. A 5-stamp mill and other machinery have been ordered.

UTAH.

At Provo E. J. Raddatz sold to C. H. Griffin & Co. several claims for \$10,000.—The Bingham Bulletin says that the past week 100 tons of galena were raised at the Spanish mine.—The last shipment from the Daisy mine at Mercur, the result of two weeks' run, amounted to 154 pounds and yielded \$38.15 per pound, a total of \$5875.

The Crescent of Park City will put its ores on to the market in crude form, and as soon as the concentrating ores upon which the McGregor mill is operating have been cleaned up, that plant will either be suspended or put upon custom ores. It is thought that better results can be obtained from the output by shipping to the smelter furnace than by reducing them to the form of concentrates. The ore shows an average of 26 per cent lead, sixteen ounces silver and a fractional amount in gold.—The Eureka Hill last week shipped from Tintic district silver and gold of over \$100,000 in value. It has suspended operation of forty stamps and has but sixty in operation. This will reduce the output of the mine to 120 tons a day.—The Undine of Silver City made a shipment of high-grade ore last week. The company has begun sinking to the 350 level, from which they will crosscut to the vein. On the level above are 33 inches of ore, of which a foot shows seventy-four ounces silver, 28 per cent lead, 6 per cent copper and \$4 in gold with 44 per cent in iron.

Work on the Rover mine at Mercur has been resumed under an option by G. A. Holmes.

An ore discovery of value is reported in the 350-foot level in the Sunbeam at Silver City.

The Centennial-Eureka at Tintic has closed arrangements with the Eureka-Hill Co. to make a mill run upon the ores from the former company's property, to decide the question of their adaptability to a mill. The Centennial has thousands of tons of a class of ore such as that which the Eureka-Hill has been profitably milling, on its dump. Should it be demonstrated that the ores of the Centennial-Eureka may be handled as successfully as have those of the Eureka-Hill, a plant of equal magnitude is likely to be built.—S. Newhouse, Pres. of the Highland Boy mine at Bingham, with his associates, has secured an option on 200 acres of ground at Mercur, on which they will at once begin development work.

The Comstock M. Co. at Park City has

made a strike of ore that assays 18 per cent copper, \$17 in gold and twenty-four ounces in silver. Of this quality of ore they have 2 feet. They will sink another 100 feet, then crosscut the vein. The point at which the strike was made is 2000 feet from the surface. The taking out of ore will begin at once.—At Park City a larger number of miners are employed than at any time since the closing of the Ontario and Daly.—A shipment of ore from the Darlington mine at Alta yielded 24 per cent in copper and twenty ounces silver, with a fraction in gold. The streak from which this is derived varies from a few inches to many, but goes through a vein all the time. The Darlington is worked under a lease by J. Matteson & Co.—The camp of Alta is said to be improving, and that twice as much work is being done as at any time since the old days of the Emma and Flagstaff.

Shipments from Tintic for last week were 110 cars of ore, six of concentrates and fourteen bars of bullion.

WASHINGTON.

(Special Correspondence).—Mgr. Brackett began work on the mine at Twisp on the 1st inst.; is now in the face of the vein in the middle tunnel. He expects by Jan. 1st, '99, to begin taking out ore. He then proposes to put in a smelter. Okonogan county and Stevens are now attracting considerable attention and some capital.

Twisp, Sept. 15th.

At Chelan Falls a large body of free milling quartz has been found. It has been developed by a trench 270 feet long, which has cut 21 feet of quartz. Sixteen assays have been made; the highest gave \$19.61 in gold and 11 ounces silver, and the lowest was 20 cents in gold and 8 ounces silver. The average of the sixteen tests made was \$9.97 gold and \$17 silver.

At Colville the Great Northern mine on Douglas mountain has cut a ledge of fair grade ore at a depth of 125 feet.

P. Clark has bonded the Davis group of two silver-lead claims in Davis camp on the south half of the Colville reservation and has put twelve men to work. The ore is silver-lead carbonates and galena. The vein is said to be large. The ore assays 374 ounces silver and 10 per cent lead. The development work started is the first in the camp.

WYOMING.

The Black Buttes Coal M. Co. will make improvements at its mine at Black Buttes station. It is proposed to put on a steam hoist, improved tippie and dump to increase the capacity. It is also proposed to go deeper and make the output 1000 tons of coal per day. They have four veins, making an aggregate of 23 feet of coal.

FOREIGN.

BRITISH COLUMBIA.

T. Charles, representing American capital, has bonded the Walker mine, near Clinton, for \$100,000. Work will start shortly.—The Le Roi at Rossland shipped last week nineteen cars of ore, averaging 23½ tons to the car, or 450 tons. There are 261 men at work, and they are operating twenty-six machines, primarily engaged in opening the property.—The Monument group of silver-copper claims, near Nelson, have been bonded to H. E. Croasdale for \$90,000, payable \$1000 October 31st, the balance at the end of a year.

The Rawhide claim in Greenwood camp has been bonded to P. Larson of the Coeur d'Alenes for \$40,000.—J. P. Graves has bought a quarter interest in the Phoenix for \$5000 cash.

At New Denver, 18 inches of ore has been struck in the Bosom. Twenty-two men are employed.—On the Miocene mine at Horseshoe, rich gravel was struck at the 400-foot level, but they have not yet reached the bottom of the channel.—The ore shipments from Kaslo for August were 1718 tons.

The Sunshine M. Co., Trout Lake district, received from the Selby Smelting & Lead Co. checks for \$12,321.95, for 123 tons 310 pounds of Silver Cup ore. A further shipment of 56 tons has gone forward. This makes 650 tons shipped the last few months, all the ore being high grade.—The Moyle group, East Kootenay, has been bonded to Vancouver men for \$125,000, with \$5000 paid.—The Hall Mines Co., East Kootenay, is reported to have made a copper strike on the Big Three claim. The company has this property under bond. On the Lone Star and Equator the same company has let a contract for another tunnel.—The product of the Rossland mines last week was 3874 tons. The greatest record made in the camp was for the week ending July 30th, when the output was 3050 tons.

The North Star Co., East Kootenay, will sink a shaft 300 feet; an order has been placed for hoisting machinery.

MEXICO.

The Felipe group of mines near Monterey, owned by J. A. Robertson, have been sold to a New York corporation for \$500,000 gold.

PROSPECTING BATTERY.

UNION IRON WORKS,

222 Market Street, San Francisco, Cal.

THIS :

Two-Stamp Self-Contained Battery

IS DESIGNED BY

THE UNION IRON WORKS

Expressly for Prospecting Work.

It was awarded First Prize at the recent Mechanics' and Manufacturers' Fair, where it was in daily operation, crushing ores from various mines throughout the State.

Weight of stamps, 275 pounds each; capacity of battery, determined by actual work, 200 pounds per hour, through a No. 7 slot-punched screen.

Entire battery weighs about 3000 pounds; heaviest piece, mortar, weighing 1200 pounds.

Can be taken apart and transported to any locality.

HOISTING ENGINES

To Our Customers and Friends on the Pacific Coast:

Through frequent complaints made to us, we have learned that unprincipled and dishonest dealers on the Pacific coast have counterfeited our trademark numbers and substituted inferior, spurious goods as ours, when ours were distinctly ordered, thus defrauding the customers and injuring our trade and reputation.

Our goods are acknowledged to be the best, and are fully warranted by us, and are marked with our name or initials or with our well-known trademark and catalogue numbers.

We request direct notice if any goods alleged to come from us, or bearing our trademark or numbers, prove to be other than the best, and perfect in every respect, as we will follow up and expose such frauds for our customers' and our own protection. We have no exclusive agents on the Coast, but our goods are obtainable from all respectable dealers in drawing materials, stationery, hardware, artists' material, etc. Respectfully,

KEUFFEL &

ESSER CO.,

New York.

Sole Pacific Coast Agents and Builders of the Celebrated

WILFLEY CONCENTRATOR.

The Wilfley Table is fully covered by U. S. patents Nos. 580,338 and 590,675. Infringements will be prosecuted to the full extent of the law.

PRICE, \$450, F. O. B., San Francisco.

Some Practical Reasons Why the Wilfley Concentrator Should Be Used in Gold Mills:

1. It will successfully handle three or four times more material than any belt Concentrator made, without exception.
2. It will save more sulphurets in proportion while so doing, and catch any float gold, amalgam or quicksilver which may escape from mortars or plates.
3. It will make cleaner and much more valuable concentrates, thus saving useless expense for transporting valueless material, as also extra cost for treatment.
4. It requires little or no attention when once adjusted and no expert is required to either adjust or run the machine.
5. It will save much expense in power and room, and the first cost of a mill requiring concentrators.
6. It has no expensive belts to crack and wear out, nor complicated machinery to keep in repair.
7. It is the only sensible plan of concentration, as any kind of material can be worked, which is not true of any style of belt machine.

One of these machines will take the place of two or three belt concentrators of any style and do very much better work.

PATENTS

DEWEY, STRONG & CO'S PATENT AGENCY.

Our U. S. and Foreign Patent Agency presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American reports, with full copies of U. S. Patents since 1872. All worthy inventions patented through DEWEY, STRONG & Co.'s Patent Agency will have the benefit of a description in the Mining and Scientific Press. We transact every branch of patent business, and obtain patents in all countries which grant protection to inventors. The large majority of U. S. and foreign patents issued to inventors on the Pacific Coast have been obtained through our agency. We can give the best and most reliable advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and circulars free.

oz., 8½c; 6s, 14 oz., 7½c; 6s, 12 oz., 7½c; 6s,

10 oz., 6½c. Paraffine Wax Candles—1s, 2s,

4s, 6, 12s, white, 8c; colored, 9c.

NAILS.—List per keg: No. 20 to 60d, wire,

\$2.35; cut, \$2.25; 10 to 20d, wire, \$2.40; cut,

\$2.30; 8d, wire, \$2.45; cut, \$2.35; 6 and 7d,

wire, \$2.55; cut, \$2.30; 4 and 5d, wire, \$2.65;

cut, \$2.40; 3d, wire, \$2.80; cut, \$2.55; 2d,

wire, \$3.05; cut, \$2.95. In carload lots, 10c

per keg less.

LUMBER.—Retail: Pine, ordinary sizes,

\$17@18.50; redwood, No. 1, \$18@20; No. 2,

\$16@18.

The following has been adopted by the lum-

ber manufacturers of the Pacific coast:

Reference to "sale sizes" is to standard

sizes of rough (from which "worked" sizes

are made), noted in list of same in export

schedule of prices.

All sale sizes 1½ inches and less in thick-

ness, and 12 inches and less in width, tongued

and grooved and surfaced on one side, when

"worked," will be ½ inch less in thickness

and 5/8 inch less in face width.

All sale sizes 1½ inches and less in thick-

ness, and 12 inches and less in width, square

edged, and surfaced on one side, and two

edges, when "worked," will be ½ inch less

in thickness and ½ inch less in width.

All above sale sizes, whether tongued and

grooved, or square edged, or surfaced on two

sides, when "worked," will be 3-16 inch less

in thickness.

All sale sizes over 1½ inches and up to and

including 6 inches in thickness, and 12 inches

and less in width, when "worked," will be

½ inch less in thickness for each side sur-

face; widths 6 inches and less will be ½ inch

less, and widths over 6 inches and up to and

including 12 inches, ¼ inch less for each edge

dressed.

All sale sizes over 6 inches in thickness, and

over 12 inches in width, when "worked,"

will be for the largest worked size possible.

Above references being solely to green lum-

ber, the worked sizes of partially or wholly

seasoned lumber will be proportionately less,

as may be determined by the shrinkage

thereof.

Internal Revenue Commissioner Scott has

made the following rulings as to the opera-

tions of the war-tax bill: A dealer in real

estate, making short and long time to answer

on promissory notes and general securities for

himself and others and real estate loans for

loaning companies, and who also buys promi-

sory notes for himself and clients, al-

though he does not make loans for himself

and others, and afterwards sell the securi-

ties, is liable to the special tax as a

broker. Merchants or others who have

a place of business "where credits are

opened by the deposit or collection of money

or currency, subject to be paid or remitted

upon draft, check or order, or where money is

advanced or loaned, or promissory notes are

received for sale," are subject to the special

tax as brokers.

WANTED.

Partner in Extensive Placer and Quartz

Mines. Free wood and water. JAMES ARTHUR,

Cornucopia, Union Co., Oregon.

Mine and Mill Superintendent

Will be open for an engagement Oct. 1, '98.

Highest References Furnished.

Can also do Mine Surveying, Mapping and As-

saying. Competent to take full charge of a gold

or silver property anywhere.

As to terms, qualifications, etc., address F. G.,

Mining and Scientific Press Office, San Francisco.

Mine Wanted.

Man of experience will develop gold mine for ¼

interest, or will bond whole property and develop.

Must have ore chute IN SIGHT. State exact con-

ditions. Correspondence with owners only. Ad-

dress P. O. Box 887, Los Angeles, Cal.

WANTED.

METALLURGIST and PRACTICAL

SMELTER

Will be open for engagement October 1st as

Superintendent of Copper or Lead

Smelting Works.

Thoroughly competent in analyzing, assaying,

and handling men. Speaks Spanish. Excellent

references. Address SMELTER, care Mining and

Scientific Press.

Assessment Notices.

NATIONAL CONS. MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Rich Gulch, Shasta County, California.
Notice is hereby given, that at a meeting of the Board of Directors, held on the 22nd day of August, 1898, an assessment (No. 4) of ten (10) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the secretary, at the office of the company, 916 Market street, Room 57, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 31st day of October, 1898, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 31st day of October, 1898, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.
By order of the Board of Directors.
GEO. W. FLEISSNER, Secretary.
Office—No. 916 Market street, Room 57, San Francisco, California.

EUREKA CONSOLIDATED DRIFT MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Forest Hill, Placer County, California.
Notice is hereby given, that at a meeting of the Board of Directors, held on the 15th day of September, 1898, an assessment (No. 13) of one-half cent per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the secretary, at the office of the company, Nos. 1209-11 Claus Spreckels building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 15th day of October, 1898, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on TUESDAY, the 1st day of November, 1898, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.
By order of the Board of Directors.
J. J. CRAWFORD, Secretary.
Office—Nos. 1209-11 Claus Spreckels building, San Francisco, California.

LEON GOLD MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, near Winchester, Riverside County, California.
Notice is hereby given that at a meeting of the Board of Directors, held on the 16th day of May, 1898, an assessment (No. 1) of 1 1/4 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the secretary, at the office of the company, room 7, fifth floor, Mills building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 25th day of June, 1898, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 25th day of July, 1898, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.
By order of the Board of Directors.
R. L. CHENEY, Secretary.
Office—Room 7, fifth floor, Mills building, San Francisco, California.

POSTPONEMENT.

By order of the Board of Directors of the Leon Gold Mining Co., the day of delinquency of the above assessment is postponed to July 9th, 1898, and the day of sale to MONDAY, August 8th, 1898.
R. L. CHENEY, Secretary.
Office—Room 7, fifth floor, Mills building, San Francisco, California.

POSTPONEMENT.

By order of the Board of Directors of the Leon Gold Mining Co., the day of delinquency of the above assessment has been postponed to August 8th, 1898, and the day of sale to MONDAY, September 5th, 1898.
R. L. CHENEY, Secretary.
Office—Room 508, Safe Deposit building, Cor. California and Montgomery streets, San Francisco, Cal.

POSTPONEMENT.

By order of the Board of Directors of the Leon Gold Mining Co., the day of delinquency of the above assessment has been postponed to September 3rd, 1898, and the day of sale to MONDAY, October 3rd, 1898.
R. L. CHENEY, Secretary.
Office—Room 508, Safe Deposit building, Cor. California and Montgomery streets, San Francisco, Cal.

POSTPONEMENT.

By order of the Board of Directors of the Leon Gold Mining Co., the day of delinquency of the above assessment has been postponed to October 1st, 1898, and the day of sale to TUESDAY, November 1st, 1898.
R. L. CHENEY, Secretary.
Office—Room 508, Safe Deposit building, Cor. California and Montgomery streets, San Francisco, Cal.

Notice of Stockholders' Meeting.

A meeting of the Stockholders' of the Eureka Consolidated Drift Mining Company will be held in the company's office, No. 1209 Claus Spreckels building, San Francisco, at 1 o'clock P. M. on WEDNESDAY, September 28, 1898, for the purpose of considering the extension of the options on the treasury stock, expiring October 1, 1898.

THE BROWNELL "PATENT LIP" FLANGE FRUE VANNER BELTS.

It has taken years of ceaseless testing and experimenting to produce the superior belt which we now offer, with elastic flanges and pliable body reinforced with specially woven duck. Every belt is manufactured by experienced workmen, and carefully tested on machines especially built for that purpose; consequently we are to-day manufacturing the best belts that mechanical ingenuity, combined with honesty of construction, can possibly produce.

MR. JAS. S. BROWNELL, 132 Market St., San Francisco, Cal.—DEAR SIR: Replying to your favor of the 18th inst., will say that in the two mills operated by this company we have nineteen of your Patent Lip flange concentrator belts in use; some of them have been in constant use for the past two years and have given entire satisfaction. I know of no better flange for a side shake machine. Yours truly, JOHN ROSS JR., Superintendent.

MR. J. S. BROWNELL, San Francisco, Cal.—DEAR SIR: For some years we have used three different styles of belts on our Frue vanner at the Mexican mill, and for smooth working and endurance the Brownell Patent Lip flange belt has proved its superiority over all others, and I unhesitatingly recommend it to all who are using Frue machines. Yours truly, EUGENE MAY, Foreman.

MINING AND SCIENTIFIC PRESS.

AND PACIFIC ELECTRICAL REVIEW.

No. 1995.—VOLUME LXXVII. Number 13. SAN FRANCISCO, SATURDAY, OCTOBER 1, 1898. THREE DOLLARS PER ANNUM. Single Copies, Ten Cents.

“Technical Terms.”

To those who think that there are “too many technical terms” in mining and scientific articles herein, it might be interesting to note instances wherein “technical terms” are really in evidence. The constant aim in this journal is to have as few “technical terms” as possible without marring the sense or value of technical articles. In this regard it is in order to note the list of papers read at the fifth annual meeting of the American Mathematical Society at Boston, Mass., on Aug. 19th and 20th. Following is a partial list: “On the ruled surfaces generated by the plane movements whose centrodes are congruent conics tangent at homologous points;” “A second locus connected with a system of coaxial circles;” “On the Hessian of the cubic curve;” “Asymptotic lines on cubic scrolls;” “Relative motion considered as disturbed absolute motion;” “On the development of the perturbative function in terms of the mean anomalies;” “Note on the differential invariants of a system of $m+1$ points by projective transformation;” “Note on the extension of the Poincare-Goursat proof of a theorem of Weierstrass’s;” “Supplementary note on a single-valued function with a natural boundary, whose inverse is also single-valued;” “The theorems of oscillation of Sturm and Klein;” “Space concepts in

CABIN ON TWENTY-EIGHT, DOMINION CREEK, BELOW UPPER DISCOVERY, KLONDIKE. (See page 328.)

DUMPS AT JUNCTION OF EL DORADO AND BONANZA.—BENCH CLAIMS ABOVE AT RIGHT HAND. (See page 328.)

dian lead miner, for under our existing tariff laws it pays him better to ship the ore across the border than to smelt it at home. American miners would rather be pleased than otherwise to have the Canadian Government put on the proposed lead ore export tax. Another Canadian proposition is to put a very high duty on imported manufactures of lead. However this might work after a while, it is evident that for a time Canadian users of imported lead products would be heavily taxed thereby with no corresponding benefit. Probably the ultimate solution of the problem from a Canadian point of view will be to promote therein the manufacture of lead products, and thus, in time, tend to become as independent as this country is in nearly every way of Europe.

ON this page are presented views from photographs taken for the MINING AND SCIENTIFIC PRESS by Col. Wilkins, in company with Alf. Tregidgo, a well-known California miner, on the occasion of Mr. Tregidgo’s recent visit to that region. On page 328 appears an article on the Klondike, written by Mr. T. for this paper, which, by reason of his prominence in the mining world, is of more than ordinary interest. He has just returned from a year’s sojourn in the Klondike, and this is his first published utterance.

mathematics;” “The subgroups of the generalized modular group;” “Non-euclidean cubics;” “On the simple isomorphisms of a Hamiltonian group to itself;” “Construction of a linear homogeneous group in m variables.” Nothing in engineering or mining can compare with the “scientific jargon” of the foregoing, and yet, doubtless, the authors of the above-named articles could not well dispense with what to many seem obscure and pedantic terms. A “technical term” that may have no meaning to one conveys exact information and expression to another, and is usually unavoidable in an article treating on any special department of science. A “technical term” is usually synonymous with an exact term, a word specially or exclusively pertaining to some particular trade, profession or pursuit, and one that could not be replaced by any other. Every business has its “technical terms,” though probably few instances can be found where the language is as severely technical as in the instance cited above.

BRITISH COLUMBIA and Canada in general object to the present U. S. tariff on lead in ore of $1\frac{1}{2}$ cents per lb., and on pig lead of $2\frac{1}{2}$ cents per lb. Some Canadian papers claim that the remedy is to put an export duty on lead ore. That would probably be objected to by the Cana-

CLAIM TWENTY-EIGHT BELOW UPPER DISCOVERY ON DOMINION—SHOWS BREAKING UP OF THE ICE AT JUNCTION OF CARIBOO CREEK, KLONDIKE. (See page 328.)

TABLE OF CONTENTS.

ILLUSTRATIONS.—Cabin on Twenty-eight, Dominion Creek, Below Upper Discovery, Klondike; Dumps at Junction of El Dorado and Bonanza—Bench Claims Above at Right Hand; Claim Twenty-eight Below Upper Discovery on Dominion—Shows Breaking up of the Ice at Junction of Cariboo Creek, Klondike, 335. Iowa Mine and Mill, Silver Lake Basin, San Juan Co., Colo., 328. U. S. N. Machine Shop Ship Vulcan; Side Elevation. Showing Decks; Plan Showing Arrangement of the Principal Tools of the Vulcan, 329. The Modern Round-House Turntable Operated Electrically, 330. New Style Crushing Rolls, 332.

EDITORIAL.—"Technical Terms;" Object to the U. S. Tariff; Views from Photographs, 325. Application of Wireless Telegraphy at a Regatta; Production of Sulphur and Pyrites; An "Apex," "Side Line," "Extralateral" Question; An Ambitious California Electrical Project; To Build One of the New Battleships; Former Cost of Comstock Mining; Miscellaneous, 326.

MINING SUMMARY.—From the Various Counties of California, Nevada and Other Pacific Coast States and Territories, 333-34-35.

THE MARKETS.—The Local Markets; Mining Share Market; Sales in San Francisco Stock Board, 346.

MISCELLANEOUS.—Concentrates, 327. The Output of Gold from the Klondike; Mining at High Altitudes in San Juan Co., Colo., 328. A Floating Machine Shop; Lead Production in the United States, 329. Modern Round-House Turntable; Kryolith—Its Mining, Preparation and Utilization, 330. Coast Industrial Notes; Personal; List of U. S. Patents for Pacific Coast Inventors; Notices of Recent Patents, 331. Is Darwinism True? New Style Crushing Rolls; Absorbed by the Westinghouse Co.; Silver-Plated Copper Plates; Recent Additions to the Collection at the State Mining Bureau Museum; Some Electrical Facts and Figures, 332. Commercial Paragraphs, 335. Recently Declared Mining Dividends; Recent California Mining Incorporations; Books Received, 346.

RECENTLY was noticed an ambitious California electrical project of the newly organized Standard Electric Co., which proposes to furnish San Francisco and intermediate points with light and power from electrical energy generated by its Calaveras Co. water power. The company now announces that it will apply for such a franchise covering the city of Stockton and will continue its line to San Francisco. The scheme is a commendable one, though so far as San Francisco is concerned it is probable that San Francisco bay will present obstacles in the way of successful transmission that will be ordinarily regarded as insuperable.

ENGLISH scientific publications have notices of an application of wireless telegraphy at a recent regatta, when Marconi is reported to have demonstrated the adaptability of his system to the transmission of press intelligence from a steam launch in motion. The yachting expert on deck dictated his account of the races while these were in progress, and pages of manuscript thus dictated descended below deck to Marconi, who sat in a cabin working his transmitter, whence the ether waves carried the news with a minimum loss of time to a fixed receiving station on shore. Arrived at this point, the news was forwarded to the press offices by telephone. It is stated that one edition of the London *Evening Mail* contained two columns of news dispatched entirely by wireless telegraphy. This notable event is concerned to be the germ of an important development of wireless telegraphy.

In the U. S. Geological Survey report for 1897, E. W. Parker says in his paper on the production of sulphur and pyrites, that, compared with the domestic consumption of sulphur, the production of this country continues to be of small proportions. In '96 was produced in this country 5260 tons, valued at \$87,200, being the largest annual production recorded. The increased output of that year is ascribed to the operations of the Frasch process in Louisiana, which consists in melting the sulphur by superheated water and pumping or forcing into the surface. The principles of the air-lift pump have recently been applied to this enterprise. The works in Louisiana, which produced about 80 per cent in 1896 of the total product, were shut down the greater part of 1897. The substitution of iron pyrites for sulphur in the manufacture of sulphuric acid continues to increase. The report says that iron pyrites is found in nearly every one of the United States, but it has not been mined on a commercial scale in more than six.

Former Cost of Comstock Mining.

As illustrating the present decreased cost of mining, compared with that of former years, it is interesting to note the prices paid on the Comstock, Nev., lode for labor and supplies in early days. One mine—the Hale & Norcross—is typical of the entire lode. During the year ending March 1, 1867, there was a product of 29,404 tons ore. The managerial expenses were \$9,331.25, the hoisting and engine department \$70,199.25, prospecting and dead work \$39,769.23, extracting ore \$101,167.94, improvements \$19,376.30, "relative expenses" \$27,321.21. The entire cost of production was \$266,679.18. It is worthy of note that the 15,639 tons of ore treated during the first six months of the year under consideration in the history of the mine specified, assayed \$1,288,132.79, and produced \$816,977.62, the loss, according to the assays, being \$471,155.17; that is, the 15,639 tons assayed \$465,190.14 in gold and \$822,942.65 in silver, and produced \$397,157.99 in gold and \$419,819.63 in silver—a tremendous waste.

In those days the cost of supplies was necessarily great. Compared with present prices it seems exorbitant. In the details of expenses in the hoisting department occur a myriad of such items as the following:

| | |
|--------------------------|----------|
| 2665 lbs. tallow..... | \$396 78 |
| 36 lbs. sulphur..... | 18 00 |
| 133 lbs. white lead..... | 35 35 |
| 320 gals. kerosene..... | 396 75 |
| 61 lbs. borax..... | 27 30 |
| 1828 lbs. car iron..... | 237 50 |
| 2046 lbs. coal..... | 132 11 |
| 7500 ft. lumber..... | 210 00 |

In the engine department among the items are:

| | |
|------------------------|-------------|
| 1916½ cords wood..... | \$26,770 16 |
| 93 gals. lard oil..... | 295 15 |
| 1 gal. varnish..... | 8 00 |

In the "prospecting" department:

| | |
|------------------------|------------|
| 268 boxes candles..... | \$1,474 00 |
| 8 kegs powder..... | 49 00 |
| 875 ft. fuse..... | 25 50 |
| 280 lbs. steel..... | 80 00 |

The labor was at the same general rate as at present, being the one item that has remained unchanged through the years. In the summary of prospecting is the item:

| | |
|----------------------------|----------|
| Miners, 3204 days..... | \$12,816 |
| Carpenters, 281 days..... | 1,405 |
| Carmen, 981 days..... | 3,924 |
| Blacksmiths, 285 days..... | 1,710 |

The average cost of ore reduction for the year was \$14.26 per ton. The cost of materials at the Gould & Curry mill for that year is given below, with the quantity and average price:

| Articles— | Quantity. | Cost. | Av. price |
|---------------------------------|-----------|---------------|---------------|
| Wood, cords..... | 11,442 | \$168,830 | \$14 72 |
| Lumber, feet..... | 172,857 | 3,725 | (per M) 42 40 |
| Shingles..... | 21,500 | 185 | 8 60 |
| Charcoal, bushels..... | 5,848 | 1,659 | 28 |
| Iron, pounds..... | 12,639 | 1,698 | 13½ |
| Gas pipe, pounds..... | 451 | 258 | 57½ |
| Castings, pounds..... | 395,099 | 33,880 | 8½ |
| Rivets, nuts, etc, pounds..... | 1,253 | 175 | 20 |
| Steel, pounds..... | 178 | 315 | 25 |
| Copper, pounds..... | 262 | 142 | 80 |
| Babbit metal, pounds..... | 3,832 | 120 | 46 |
| Nails, pounds..... | 172 | 417 | 11 |
| Zinc, pounds..... | 35 | 42 | 25 |
| Turpentine, gallons..... | 25 | 72 | 3 00 |
| Belting, pounds..... | 2,882 | 2,192 | 1 00 |
| Packing, pounds..... | 494 | 497 | 1 00 |
| Rope, pounds..... | 393 | 96 | 25 |
| Hose, pounds..... | 136 | 97 | 20 |
| Sulphate of copper, pounds..... | 87,353 | 17,588 | 20 |
| Salt, pounds..... | 345,668 | 10,943 | 3 |
| Lard oil, gallons..... | 1,360 | 2,487 | 1 64 |
| Kerosene oil, gallons..... | 965 | 1,615 | 2 47 |
| Linseed oil, gallons..... | 49 | 35,013 | 51 89 |
| Quicksilver, flasks..... | 675 | 214 | 23 |
| Cut bolts, pounds..... | 743 | 633 | 1 to 75 |
| Screws, pounds..... | 2,980 | 819 | 27½ |
| Candles, pounds..... | 71 | 67 | 20 |
| Axes and handles..... | 42 | 30 | 50 |
| Picks..... | 239 | 231 | 1 39 |
| Shovels..... | 487 | 2,087 | 4 28 |
| Feed, sacks..... | 196 | 1,120 | 5 71 |
| Hay, bales..... | 116 | 58 | 50 |
| Axle grease..... | 280 | 280 | 1 00 |
| Copper rivets, pounds..... | 10,863 | 1,361 | 12½ |
| Tallow, pounds..... | 15 | 60 | 4 00 |
| Alcohol, gallons..... | 189 | 147 | 77 |
| Brooms..... | 126 | 46 | 32 |
| Sledge handles..... | 157 | 77 | 50 |
| Lamp chimneys..... | 531 | 174 | 32 |
| Hoes..... | 76 | 71 | 1 00 |
| White and red lead..... | 1,241 | 242 | 20 |
| Blankets..... | 43 | 347 | 8 00 |
| Leather..... | 575 | 246 | 42½ |
| Stone coal..... | 9,751 | 714 (per ton) | 150 00 |

And yet, despite all, the business even at such apparently ruinous figures, and carried on under such a wasteful system, showed a profit. For the year indicated the assessments were \$1,232,380, the dividends \$1,794,400.

So far as the stock market was concerned few knew and fewer cared what anything around the mines cost. To the street it mattered little that coal cost \$150 per ton or skilled labor \$6 per day. And the strangest part of it all was that though the system was lavish and the methods destructive, yet it was the speculative element that furnished the opportunity for the first example of deep metal mining on this continent. In those old Comstock days there was no cautious sinking from level to level, as the

ore found paid for the work of going down another 100 feet. It was bold, daring development made possible by unlimited funds furnished by the speculative public, not with that intent but with that result.

THE Union Iron Works of San Francisco will build one of the three new battleships ordered by the U. S. Government. The recent war has modified many of the former governmental plans regarding construction, draft, armament, etc., of American battleships. It is probable that the three for which contracts have been awarded will be protected by the new Krupp armor. Experiments with this at the naval proving station at Indian Head have demonstrated its superiority in toughness and resisting qualities to the plates treated by the Harvey process. Experts in ordnance matters are satisfied that the Krupp armor is superior to the Harvey. A 6-inch Krupp plate has shown remarkable results when attacked by a 6-inch rifle. Three shots fired at this plate did little damage, none but the last penetrating it entirely. At that test it was proved that a 6-inch plate of the Krupp type was equal to an 8-inch such as is now supplied to the navy. The greater strength of the new armor will permit more protection being given the new battleships of the Indiana and Kearsarge class at points where plates now taper to 5 inches or less at the bow and stern. It is probable that the fine battleship Wisconsin, now nearing completion at the Union Iron Works, would be built on different lines had not her construction begun before the war. She has a coaling capacity of 1200 tons and will be able to steam sixteen knots an hour; but the experience gained in the late war can hardly be utilized in her case. It will be different with the next one built here—the Ohio. She will be so constructed that, in case she is needed as badly as the Oregon was at Santiago, she will not have to rely much upon the inefficiency of her antagonist. In the new vessel increased speed and coaling capacity will be required, three of the essentials being the ability to carry 2000 tons of coal, to attain a speed of eighteen knots, and run 10,000 knots at the rate of ten knots an hour.

ANSWERING an "apex," "side line," "extralateral" question: assuming that the side lines run on each side of the course of the vein or lode, distant not more than 300 feet from the middle of such vein and parallel, the outside portions lying between vertical planes drawn downwards through the end lines, the inquiry is to be answered in the affirmative—that is, a quartz locator can follow the dip of his ledge, vein or lode outside of his end lines, where the adjacent ground is owned by other parties, the top or apex of his ledge lying inside of such surface lines extending downward vertically. This is the law as followed by the United States Supreme Court in general; but only in general, for there are several decisions in special cases on this subject; more especially that one by Justice Field in the case of King vs. the Amy and Silversmith Mining Company in Montana, where the holder of the Amy claim was refused the right to follow the vein into the Consolidated claim by reason of confusion between the end lines and side lines. In the Amy claim the lines marked as side lines crossed the course of the strike of the vein and did not run parallel to it, being therefore interpreted by the United States Supreme Court as constituting end lines. The most recent and in every way the most lucid interpretation of this matter appeared in the issue of July 2, '98. In the case of the Del Monte vs. the Last Chance the United States Supreme Court decided that if the apex of a vein crosses one end line and one side line of a lode mining claim as located thereon, the locator of such vein can follow it upon its dip beyond the vertical side line of his location. If inquirers will refer to the issue named they will find this entire matter clearly and exhaustively discussed and decided by the highest tribunal on earth.

A CRIPPLE CREEK, COLO., PAPER has an unusual notice, even for a State that issues non-assessable stock. The Boston & Cripple Creek G. M. Co. gives its stockholders notice to pay a 10-cent-per-share assessment, with the alternative of having their interests "confiscated." It often amounts to the same thing, but public announcement of the intent to "confiscate" delinquent stock is unusual.

Concentrates.

BROKERAGE in Dawson is on a 10% commission basis. Interest is 10% per month.

THE Denver, Colo., *Mining Record* says that Cripple Creek's average of smelting ore is \$72.30.

A ROUND tank, 20 inches inside diameter, to hold 100 gallons should be 73.294 inches in length.

In Mercur, Utah, gold is produced from the mine cheaper than silver can be there so produced.

THE Leadville, Colo., *Democrat* estimates the mineral output of that district since 1878 at \$253,290,078.77.

It is locally estimated that the gold output of Boulder county, Colo., will be \$300,000 more than a year ago.

In the Leadville, Colo., district there are seventy active mines, producing gold, silver, copper, lead, iron and zinc.

THE Kilton reduction works at Boulder, Colo., are handling 100 per cent more ore than at any period in their history.

CHAS. POULOT, having searched for uranium and platinum in Oregon and Washington, says his search has been fruitless.

THE American G. M. Co. is operating machines at Sheep Creek, Alaska, by air conveyed 13,000 feet from the compressor.

DURING September the names of 246 new subscribers were received at this office. Of these, 131 were from the State of Colorado.

C. J. STRATTON, Mgr. Belle of Granite mine, Granite, Colo., while in a drift last week, was killed by the falling of a large slab of rock.

In a drilling contest at Rossland, B. C., Sept. 19th, for the championship of the province, M. McNicol in fifteen minutes drilled 37 inches.

In the stock market it is different from salvation. In the latter one is saved by faith; but in the former you are often saved by want of it.

THE United Verde mine at Jerome, Ariz., at 300 feet depth is said to have 96 feet of solid ore and at 500 feet the ore body is reported 450 feet wide.

THE Sonora, Cal., *Democrat* says that when the autumn rains furnish a water supply twenty newly developed mines will begin crushing ore in Tuolumne county.

THE Copper Queen mine at Bisbee, Ariz., which when at a depth of 200 feet was about to be sold for debt, has at 800 feet ore enough in sight, it is said, to run fifty years.

THE mining assessment increase in El Paso county, Colo., in which Cripple Creek is located, for '98 over '97, is \$613,000 and the increase in money and credits is \$200,000.

In the deepest iron mines of Sweden the natural ventilation is notable. The temperature rises to ten degrees Centigrade, and generally varies between six and nine degrees.

In a petition to the Minister of Mines for British Columbia, the Miners' Union at Rossland unanimously adopted a resolution asking that a School of Mines be established in that city.

THE *Miner* says that of the \$2,000,000 paid for the Center Star mine at Rossland, B. C., O. Durant received \$788,035.60, and about an equal amount went to A. H. Tarbet of Butte, Montana.

In the Bell mine at Butte, Mont., last week, J. Mourn, attempting to jump from the deck of the cage while in motion, at the 1000 level, was caught between the wall plate and cage and killed.

NEXT Saturday the United States Civil Service Commission will hold an examination at Port Townsend, Wash., for the position of assayer in the customs house in that city, at a salary of \$5 per day.

THE United States Government is reported arranging for a shipment of 10,000,000 ozs. silver bullion from Philadelphia to San Francisco, by special-guarded fast freight train, for coinage for Oriental use.

ALPHONSE FRELTY, Pres. of the American Society of Civil Engineers, says "on the engineer depends the safety of the capital invested by those who repose their confidence in him, and on the soundness of his designs also depends human life."

THE output for July of pig iron in Germany, including Luxembourg, was 620,554 tons, an increase over June of 25,339 tons, and an increase over July, 1897, of 50,826 tons. From January to August, current year, the total was 4,219,325 tons, an increase of 307,752 tons.

THE total gold output of the South African Republic for July, '98, was 382,007 ounces; of this the Witwatersrand contributed 359,344 ounces and the outside districts 22,663 ounces. The August gold yield of the Transvaal, S. A., was 398,285 ounces; of this the Rand furnished 376,911 ounces.

It is believed that if the U. S. Government builds the contemplated restraining dam in the narrows near Smartsville, Cal., upon plans necessary as based on the supposed forthcoming report of the Government Engineers, it will be the largest and most substantially built water barrier in the world.

ALL that Colorado wants to know is what is wanted in the metal line, and straightway it is supplied. Till silver slumped, the Centennial State led the list as a silver producer; this year it is in the van of the gold output, and now has some idea of crowding Michigan or Arizona for first or second place as a copper producer.

SINCE Aug. 2nd there has arrived at San Francisco from Australia gold to the amount of \$28,712,729. The greater part of it was in English sovereigns and was recoined into American money in the San Francisco mint. During the same time gold to the amount of \$16,875,000 has been received at New York from Europe.

THE coinage of gold by the United States mints in 1897 was \$64,044,885—nearly 50 per cent more than the average annual coinage since 1870. Since the discovery of America the total value of the gold produced to 1898 (estimating 1897 at \$240,000,000) was \$9,023,320,600. Of this amount \$6,065,097,600 has been produced since 1850.

POSTMASTERS at money order offices are now authorized to issue money orders payable at their own offices. This practice has not heretofore been allowed and the new departure is for the accommodation of people who, not having an account with a bank, desire to follow this economical and absolutely safe method in payment of bills, etc.

DURING the week about 300 miners and prospectors have returned dustless and despondent from the Klondike. A few have money, the vast majority glad to get back anyhow. It is there as everywhere in all gold regions: some secure thousands, others starve to death; the great majority returning

curse the country. So far that region has cost more than it has yielded.

FILES can be resharpened by immersion for a short time in dilute acid. They must be first cleaned. A solution of sulphate of copper will remove iron filings from a file without affecting the file itself. Zinc filings can be dissolved out with dilute sulphuric acid, and copper filings with dilute nitric acid. Any grease must be removed from the file first. This is best done with a dilute caustic alkali.

UNDER date of Sept. 23rd, a letter from Tampa, Florida, from a former Arizona subscriber, inclosing \$3 for renewal, says: "Uncle Sam's call for packers reached us in the mountains and ninety-five of us were hurried to Florida. Some of us are still here. I have lost fifteen pounds in weight; no longer a mine superintendent, just a member of 'pack train No. —'; nothing here but sand, heat and moisture."

In all mining countries where isolated veins are worked a large number of them have been abandoned and taken up again: abandoned because water, accidents, increased depth or barren streaks rendered their working burdensome, and, afterwards, taken up again, when they have, by the aid of capital, been proved to be productive mines. The same mines have been declared to be rich or exhausted for these reasons at different times. Exhausted, always when the owners were discouraged or "broke," and rich after further development had demonstrated their value.

CASES of poisoning by cyanide of potassium are not numerous. It is believed that a ready and effective antidote is furnished by peroxide of hydrogen (H_2O_2). A German paper states that it has been applied successfully to $\frac{2}{3}$ to 3 per cent solution in subcutaneous injections, which were performed every four minutes at different parts of the body. At the same time the stomach was also washed out with a 2 per cent H_2O_2 solution. The rationale of the process is that peroxide of hydrogen forms with hydrocyanic acid a substance known as oxamide, which is a harmless compound. The reaction is thus stated: $2HCN + H_2O_2 = 2CONH_2$, which is the formula of oxamide. Peroxide of hydrogen is not expensive, and it would be a wise precautionary measure if a supply were kept on hand at works where cyanide is employed.

WHERE copper matte is smelted by the reverberatory process the slags from the refining-furnaces, generally containing about 40 per cent of copper in the form of suboxide, are returned to the blister-furnace, there at once aiding in the production of metallic copper from the regulus or subsulphide of copper. To regain the copper from the slags of the blister and matte-smelting furnaces, these must be reduced in a cupola or blast-furnace with the aid of iron pyrites, whence will result a secondary matte, and a slag clean enough to be discarded. The following is an example of a smelting-mixture of such material:

| | Pounds. |
|--------------------------|---------|
| Coke..... | 350 |
| Matte-smelting slag..... | 2,500 |
| Blister-slag..... | 300 |
| Pyrites..... | 600 |
| Carbonate of lime..... | 400 |

THE annual meeting of the Comstock Tunnel Co. will be in New York City, Oct. 10th. Contracts with the Con. Cal. & Va., Best & Belcher, Gould & Curry, Savage, Hale & Norcross, Chollar and Potosi Companies give the Tunnel Co. a royalty of 4% upon the coin value of the bullion contained in all ore found upon the Brunswick lode and an additional payment of \$3600 in cash out of the first ore taken from the 650 feet of ground which had been in controversy. The Tunnel Co. also receives 40 cents per ton for transporting ore and waste rock to the mouth of the tunnel. Past due royalties in dispute amounting to \$579,52, arising from ore previously taken from the Brunswick lode, have been paid. The company's announcement says: "The great problem of deep mining is now receiving much attention upon the Comstock lode and at San Francisco. The successful solution of these problems is of the utmost importance."

THE method of making leaded brass is as follows: The copper is melted in a plumbago crucible under a good layer of charcoal, and when hot enough to avoid chilling (no hotter) the spelter is added and then the lead. The mixture is next stirred thoroughly with an iron stirrer, and, if necessary, allowed to get hot enough before pouring to run without forming cold shuts, otherwise a "spilly" bar will result. The determination of this temperature is the most difficult problem of brass-casting, and is the most important point in the operation, for if the metal is allowed to get too hot it will either crack in rolling or become "speuy," that is, full of blow-holes; or often both these faults will be present. On the other hand, if poured too cold the divided metal falling to the bottom of the bar will unite and the metal will become "spilly," that is, covered with splinters or scales when the metal is rolled or drawn, due to the ununited metal being extended. The determination of this temperature is made by the eye, and no other satisfactory method for obtaining it is known.

PRESENT discussion regarding correctness of assaying brings into prominence the sometimes forgotten fact that a good assayer is often charged with failure because his customer is ignorant of the first principles of sampling ore. Sometimes a piece of rock is broken in two, the halves sent to different assayers, widely varying results are obtained, and one of the operators is charged with error, when in fact both are correct, and the results are chargeable to the fact that the metal was unevenly disseminated through the sample. It is well to remember that like results can only be reasonably expected when the sample is finely crushed, thoroughly mixed and carefully divided. The careful miner will treat his sample in this way, grinding as fine as his circumstances will permit, mixing and dividing carefully, and in every case reserving a portion of the sample, so that a check assay can be made, if desired. As the best men are liable to an occasional mistake, no conservative miner will expend any large amount of labor or money upon the result of a single assay, but will base his future work upon the concurring results of two or more reliable assayers.

THERE have been a number of attempts to make a double-acting pump, retaining therewith the advantages of the Cornish. Its use would save space in the shaft, the pipes for a continuous discharge occupying less than one-fourth the area of a single discharge pipe and its rod. Cushier's system of pumps for deep mines consists in having sets of two pumps, each working in concert, one above the other, the suction and discharge pipes being common to both pumps. The pumps are placed at intervals of about 200 feet in the shaft, the power being transmitted directly through the center of the plungers.

The connection with each other and to the motive power is connected by means of a steel-wire cable, encased in wood, preventing it from external wear, as well as from rust. This cable is fastened to, and its length regulated by, shackles. The plunger of the lower pump, in a set, is double in area that of the upper one, so that in working on the upper stroke one-half the water raised fills the chamber of the upper pump, the other half being forced out through the discharge pipe on the down stroke; the upper pump plunger forces out, in its turn, the water in the chamber, thereby causing a continuous delivery.

THE relative merits of chlorination and cyanide in the treatment of gold ores are of constant interest. Each process has strong advocates; each has its peculiar advantages and disadvantages; neither is adapted to the treatment of all kinds of ore. The barrel chlorination plant is simple and of moderate cost; and for ores not containing large percentages of silver or copper, or not having a lime gangue, the process is almost ideal. The precipitated gold is clean, free from other metals, and requires little after-manipulation, regular yields of 92 to 94 per cent of the assay value of the ore treated being not unusual. The disadvantages are that the ore requires a thorough dead roasting before it can be treated economically, and that any silver contained in the ore is lost, or must be recovered by some subsequent treatment. The cyanide process can be worked with fairly successful results on some unroasted ores, and on some ores that are much more complex than those adapted to chlorination. The extraction of gold rarely reaches in actual practice over 85 per cent of the assay value, and, indeed, when worked on a large scale seldom exceeds 80 per cent, unless the ore is subjected to the same previous roasting as is necessary for chlorination. One objection to the cyanide process is the bulk of the precipitates and the necessity for special appliances for their after treatment. The use of zinc shavings as the precipitant requires that the zinc shall be distilled off before the gold can be melted and refined, and loss usually occurs in this after treatment.

RETURNING Klondikers claim that corruption and duplicity characterize the conduct of Canadian officials at Dawson. One man, who had heard of the difficulty of getting valuable properties recorded, and who took every precaution to observe the law, says he went to a new locality and found a good claim, which he properly staked out and left a man in charge, while he went to Dawson to record it. In relating his experience, he said: "I stood in line before the Gold Commissioner's office from 9 o'clock in the morning until late in the afternoon, when my turn came. I answered the usual questions about where the claim was, how much gold I had found and the prospects. The official hesitated, and then told me to call in a couple of days and he would attend to it. I went and I returned, and I was told that the claim had been recorded. I could have shot that man if I had been armed. I had not a cent in the world, and had gone there to see if I could not get enough to support my wife and babies. I had hardships that nearly prostrated me and then made a find only to be beaten out of it by one of the recorders, who used my application for a tip and had one of his friends take up the claim." Others say that a man cannot stake out a claim with any assurance of getting it recorded without he has a "stand-in" with the recorder's office, and even then he is obliged to be perpetually paying blackmail on penalty of losing all he has. One of the recorders, it is claimed, has gold dust to the value of \$90,000, and yet he draws only \$150 a month salary, and is not permitted under the laws to take up a claim. The speakers said there is no question that his \$90,000 is tribute levied upon his unfortunate victims. "You cannot even get your mail from the postoffice in less than two or three days," they said, "unless you pay a mounted policeman \$1, when you will have it in fifteen minutes."

A PONY, Montana, subscriber writes that at a rock-drilling contest there July 4th, Moore & Beebler of Red Bluff, Montana, drilled 32 inches in fifteen minutes; "the rock drilled was the hardest granite, and broke drills for every team but the winners. Fifteen drills were allowed, $\frac{1}{2}$ steel, 8 lb. hammers." He also states that in fifteen minutes "Williams & Lusher of Pony drilled 27 $\frac{1}{2}$ inches; Sincos & Bonham of Pony, 27 inches; Crampton & Conley of Pony, 26 $\frac{1}{2}$ inches; Duncan & Johnson of Pony, 24 $\frac{1}{2}$ inches; McKinnon & Pellete of Sterling, 23 $\frac{1}{2}$ inches." The Pony man asks for details of former similar contests elsewhere: On Feb. 22, 1898, at the Golden Jubilee Mining Fair, San Francisco, the MINING AND SCIENTIFIC PRESS gave a championship gold medal. The contest of three-handed teams, fifteen minutes' continuous work, each team allowed sixteen drills, was won by Page, Kitto and Dingle of the Gerry-mander mine, Tuolumne Co., Cal., 41 $\frac{1}{2}$ inches; the brothers Feeney and Larkin of the Omaha mine, Nevada Co., Cal., second, 36 $\frac{1}{2}$ inches. P. and J. Feeney of the Omaha mine, Nevada Co., Cal., won the two-handed contest, 26 $\frac{1}{2}$ inches; Kitto & Page of the Gerry-mander mine, Tuolumne Co., second, 26 9-16 inches. In the single-hand contest, J. J. Coan of Nevada City won first prize, 18 inches; T. L. Coffey, Nevada City, second, 17 3-16 inches. Subsequently, in a record-breaking, triple-handed drilling, Page, Kitto and Dingle drilled a hole through 43 11-16 inches hard-grain California granite in fifteen minutes, breaking the former world's record of 42 inches. The first similar rock-drilling contest on the Pacific coast was held at the Midwinter Fair, in San Francisco, May 21, 1894. At the Denver contest the previous year the world's best record was made by D. L. Jones, who, single-handed, sank a hole 18 11-16 inches deep in fifteen minutes. Page and Riggin of Butte, Montana, drilled a hole 29 15-16 inches in that time. Hearn and Rinker of Denver, Colo., beat that time in '93, but not officially, they having drilled a hole 31 $\frac{1}{2}$ inches in fifteen minutes. At the Midwinter Fair contest, E. F. Durham of Grass Valley, Cal., took the first prize and the world's championship, drilling a hole 19 31-32 inches, single-handed, in fifteen minutes, through Rocklin granite. T. J. Ahearn of Grass Valley, Cal., drilled 19 9-16 inches. In the double-team contest, Kitto and Harvey of Amador Co., Cal., put a hole down 30 21-32 inches, winning first prize. Feeney and Lynch of Grass Valley drilled 27 5-32 inches, taking second prize. In the three-handed contest, Dingle, Kitto and Harvey of Amador Co. put a hole clear through the 40 inches of Rocklin granite and had about 2 inches in on a second hole when their fifteen minutes was up, they winning first prize. The Feeney brothers and Lynch of Grass Valley, Cal., drilled almost through the 40 inches of granite in the quarter of an hour, taking second prize. In the San Francisco contests of '94 and of Feb., '93, the single-handed drillers used $\frac{1}{4}$ -steel and 4-pound hammers; double and triple teams, $\frac{1}{2}$ -steel and 8-pound hammers.

The Output of Gold From the Klondike.

TO THE EDITOR:—On my arrival at St. Michael, Alaska, Aug. 29, 1897, a representative of one of the established commercial houses there said: "I know of \$1,200,000 worth of 'dust' having been taken out, and what more than that I cannot vouch for." After having been in Dawson a little while, I found that there was about \$400,000 deposited in each of the two companies' safes, viz: Alaska Commercial Co. and North American Transportation & Trading Co., and I calculate the amount in actual circulation very small. This was last October (1897). There were only two stores in town, viz: those owned by the two commercial companies, which were rival concerns, and each covered a block of ground with their stores and warehouses. The remainder of the business part of town was occupied by saloons and dance-houses. Neither of the stores had anything to sell, and what the saloons had to sell there were very few buyers for. Those who had money had it with one or the other of the commercial companies, and were looking for a chance to buy anything in the eating line, and pay any price that was asked for it. Our steamer, the *Bella*, was the last to arrive, and all her provisions, excepting 700 gunnies of flour, a few potatoes in tins and a little bacon, the property of the Alaska Commercial Company, to whom the steamer belonged, had been taken out of our hold by an armed mob at Circle City. Then the crowd on shore, realizing that their last hope for relief had arrived—that the river was rapidly closing, that they would be ice-bound for the next eight or nine months with absolutely no spare food for anyone—became downhearted and desperate. Many who came down the river to Dawson and were fortunate enough to arrive with a year's outfit (having had a pretty rough experience on the way), were anxious to sell what they had, only retaining for their individual selves sufficient quantity of food to last a month or so, until the river was frozen over, so they could return again to Dyea over the ice. They saw an opportunity to sell to advantage, and realized from \$1 to \$2 per pound for any kind of food they cared to dispose of, flour preferred. Such people never even went out of Dawson City, and had no desire to spend what little profit their venture had brought them by paying 50 cents per drink, and took their dust with them over the ice to civilization, so as to have a stake on arriving there. These people never went near the mines and know nothing at all about them. I never saw a mining camp with so little money in circulation as at Dawson upon my arrival there, the beginning of last October. After interviewing several owners, who should know, and ascertaining to the best of my ability the amount produced by them, I do not think the product of the Klondike for 1897 was more than \$2,000,000.

During last winter, after the trail had been broken, from 800 to 1000 men went out of Dawson over the ice. They went every kind of way—in small groups and in large parties—some very scantily provided for the trip and others in good shape; some with money that they had procured by selling their outfits, and the majority with just enough grub to take them to tide water. From these the discouraging reports on the mineral wealth of the Klondike were obtained.

At Dawson, and mining in the surrounding country, I judge were not more than 2500 men. I don't believe the entire population last December from Stewart river to Seventy Mile, in the Yukon mining district, would exceed 5000, counting Indians and all. Of the 2500 men mining, I am sure not 1500 were working on paying gravel, and that number did not average five months' work to the man. I am speaking of actual workers. Of the 1500, I place 1000 as engaged on El Dorado and Bonanza creeks, and 500 elsewhere. I calculate that \$7,000,000 to \$8,000,000 was extracted, five-sixths of this from the two creeks mentioned, in the following rates, two-thirds from El Dorado and one-sixth from Bonanza. Bonanza creek below discovery was a great disappointment, but some claims above discovery were a surprise. Whilst this pay gravel was being extracted from developed mines on El Dorado, Bonanza, Hunker and Bear creeks, and a claim or two on Sulphur and Dominion, the balance of the 2500 men were doing "representing work" on undeveloped claims (as the Canadian law demands continuous work for three months during each year in the Yukon mining district, on each claim, under penalty of forfeiture), with flattering results as far as Dominion, Sulphur and Bear creeks were concerned. As claim after claim would be developed and pay gravel struck, the news would come to Dawson: So and So, on such a claim, struck so much to the pan on bedrock. Sometimes grand results would be reported—four ounces to the pan on some El Dorado claim, or So and So took out \$160 to the pan on bedrock. With such reports the value of the prospective year's output would increase a few millions and be reported to the outside world by some promoter who left Dawson during last winter and came out over the ice with claims for sale. This is how the output of the Klondike has been unneces-

sarily exaggerated. I think eight millions will more than cover the gold output for 1898. Nearly twenty tons of gold dust, extracted by 1500 men in less than five months to the man, is not at all bad, and more creditable to the actual workers when all the uncomfortable conditions under which they work and exist are known and understood. An average yield of over \$1000 to the man per month gold produced for actual labor is pretty hard to equal in any other part of the world at the present time.

The principal creeks being worked and developed at the present time head from the divide between the Klondike and Indian rivers. This divide consists of a series of peaks, or domes, as they are locally termed. The highest of these rises to an elevation of 3400 feet above sea level. This divide starts at the head of Bonanza creek and extends southeasterly for twelve miles to the head of Dominion creek. Emptying into the Klondike river are Bonanza (El Dorado is the right-hand fork of Bonanza), Bear creek, Hunker creek (Gold-bottom is the right-hand fork of Hunker creek), All Gold and Too Much Gold creeks. Emptying into Indian river are Dominion (which is really the left-hand fork of Indian river), Sulphur and Quartz. The last-named is the largest of all the creeks and has many tributaries (locally called "pups") but has been the least prospected of any. Last winter's work, in addition to the gold yield obtained, thoroughly demonstrated the existence of valuable pay channels on Dominion, Sulphur and Bear creeks, and determined that Dawson would be a gold-producing center for many years. The faith of the "old timers" in the Yukon is re-

ritory and Alaska to the Bering sea. The Yukon river runs through it a distance of 2500 miles. Gold has been found on the Klondike, Sixty Mile, Forty Mile, American creek, Birch creek (Circle City diggings), and Manook creek, where \$150,000 was extracted last year (and which is 500 miles northwest from Circle City), and will undoubtedly continue to be found in other creeks for all time, as there is nothing that will develop a country quicker than a gold excitement. Thousands will go there and make failures; hundreds will be successful. But millions and millions of dollars will be produced and be brought forth for the benefit of mankind. The valley of the great Yukon traverses an empire, the gold production of which in time to come will support hundreds of thousands. ALF. TREGIDGO.

Mining at High Altitudes in San Juan Co., Colorado.

TO THE EDITOR:—As a general proposition the ores of San Juan county are sulphides of lead, iron and copper, carrying gold and silver. In the product, as between gold and silver, the greater values are in gold. About 80 per cent of the values are shipped in the form of concentrates. These concentrates run about 35 per cent lead. The bulk of the ores mined in San Juan county are estimated to run between \$10 and \$30 per ton in value. In earlier years many richer leads were found and worked out, so that

IOWA MINE AND MILL, SILVER LAKE BASIN, SAN JUAN CO., COLORADO.

markable. Those who have worked for years under adverse conditions and have succeeded in "striking it rich," and many of whom could leave the frozen North forever and have enough to keep them in affluence for the remainder of their lives, are the largest buyers of "outside" claims as soon as they shall have been proven to contain gold, and for which they invariably pay the price asked; and I believe those who own the best claims would sooner stay by them and work them out than sell for a fair price. Hence, nearly all the best claims that were developed during last winter were purchased by the "lucky ones," who were working paying properties on El Dorado and Bonanza creeks. There were very few mining men in Dawson who were looking for claims to work last winter; claims were developed by men who never saw a mine before, but who had the good fortune to arrive with a year's outfit and the stamina to go to work and develop a claim for an interest. Some of these made fortunes, and others lost their year's work. Developing a claim on the Klondike is not an easy job, and the majority of men, having such an experience to get to Dawson, and finding the conditions there so different to their expectations, get downhearted and disgusted, and are only too ready to sell out what they have and return again to civilization.

It requires a man with good health and a great deal of determination to make a success on the Yukon—one who must make up his mind to rough it, and not be afraid of hard work. The majority of those who go there want something easy, and would rather have some inducement to get the dust from the miner than to be himself a pioneer. Working on the outside for half the year, ten hours a day and the thermometer ranging from 15° to 50° below zero, is easier to talk about than to experience.

There is a great mineral belt traversing from southeast to northwest through the Northwest Ter-

mining in San Juan county now resolves itself to the problem of producing and concentrating a heavy tonnage of low-grade ores at minimum cost. The most extensive producers in the county are putting in such equipment as will enable them to meet these requirements. Several properties near here are now treating ores which run as low as \$8 per ton. Worked on a larger scale, at relatively lower cost, they could treat ores of a grade still lower, and it is possible that as depth is attained the values may not increase. That ores of moderate grade exist in extensive ledges throughout this rugged, mountainous region no one questions. It is a place for the individual or company with large capital to operate on low-grade ores, wherein a small profit per ton on a great tonnage is desired, rather than rich streaks of doubtful continuity.

The difficulties, however, attending the development and operation of a big property in this section are not to be overlooked. The season of pleasant weather is short. In winter the snows are deep, and the mountain sides being steep, the snowslide is a constant source of danger. The mines, as a rule, are near the mountain crests, at high altitudes. For example, the Silver Lake, Iowa and Royal Tiger—all in Silver Lake basin—are 12,300 feet above sea level; the North Star, on King Solomon mountain, is 13,800 feet; the Sunnyside, up Eureka gulch, is at an altitude of 12,800 feet, and the Gold King 12,000 feet. At such heights the effectiveness of labor is doubtless 25 per cent less than at some point below timber line. In winter it requires good heating facilities, which are sometimes very expensive. By reason of the fact that most of the mines are situated beyond the reach of wagon teams the ore must be brought down either on pack animals or by tramway. The Silver Lake has its large mill at the mine and the concentrates are sent by a tramway line

down to large ore bins at the railroad track, three miles distant and 3000 feet lower. The Iowa conveys its crude ore over its two miles of tramway to its mill, 2000 feet lower. The Royal Tiger sends its ores to the Iowa mill. The North Star has its own mill in the Animas valley and uses pack animals to move the ore. The Sunnyside has an 8800-foot tramway from the mine to the mill. The management of this property is erecting a 100-ton mill at Eureka, which will require one one-half miles of additional tramway. The Gold King, on Bonita mountain, drops its ore 1500 feet within a mile and a half by means of a tramway. This property has a 20-stamp mill in operation and ten additional stamps are being put in.

A few years ago, before these excellent wire rope tramways were put up, there was a general closing down of mines of San Juan county at the approach of winter, not to reopen till the groundhog saw his shadow and the Johnny-jump-up blossomed on the sunny side of the mountain the following May. It is different now. None of the mines above mentioned, with their modern equipment, will close down the coming winter. Every place where a workman is required is under cover. In the county generally there will be as many men employed the coming winter as have been the past summer. Several properties are preparing to increase their output.

The Sunnyside ores are a lead sulphide, with some streaks of quartz bearing free gold. In this respect they differ from those of many other mines. The great bodies of ore in this mine run from \$18 to \$25 per ton. The new mill will be equipped with crushers, rolls, amalgam plates and concentrators.

The Gold King ores are a sulphide of iron, with gold values preponderating. The present output is about forty tons per day, though this will be increased.

The Pride of the West, in Cunningham gulch, produces lead and silver. The ores are concentrated to 50 per cent lead and thirty-five ounces silver. Thirty tons per day are milled. This property started up this year after ten years' idleness.

The North Star, which has a record of producing over \$1,000,000 in high-grade silver-lead ore, has been worked twenty-two years. It is now in medium low-grade ore and employs thirty men. Its workings are extensive, the five main levels running clear through the mountain.

Recently new work in Maggie gulch has resulted in some very high-grade ore.

It is estimated the county is shipping about 700 tons of concentrates per day.

Around Ironton and Red Mountain, which in former years was the center of the greatest activity of the San Juan, there is almost a cessation of work. The idle mills and lifeless hoists testify to this. The richer ores were found in chimneys and in most cases these are worked out, though it is possible others will be found. The ores now available are as a rule very low grade, and exist in vast bodies. They are iron and copper sulphides and will hardly bear shipment with present producing facilities and with silver prices as they now stand. I do not wish to give the impression that the Red Mountain district is to be abandoned. The ores are there and the day will come when they will be mined on a large scale and

A Floating Machine Shop.

On page 184 of the issue of Aug. 20, '98, appeared a reference to the floating machine shop Vulcan, a repair ship used by the U. S. navy in the operations of the recent Spanish-American war in Cuban waters. Several requests for further data in connection with that vessel are herein complied with.

Private Atlantic American liners have long had small machine shops on board, but it was not until the early months of '98 that the idea of devoting one vessel to that purpose entirely was put in shape by U. S. naval officials. While no one except the mechanical and steam engineering department of our navy seems to have given much thought to the ques-

U. S. N. MACHINE SHOP SHIP VULCAN.

tion of repairing the machinery of our ships on the water, there was no good reason to doubt the success of such an innovation. The idea was a common-sense one, for our warships are now huge ma-

vessel. The master machinists even claim that, should occasion demand it, they could turn out rapid-fire guns.

The machine shop includes plate-bending rolls, punching and shearing machines capable of working on steel an inch thick; also lathes, planers, drills and milling machines, blowers for forge and ventilating purposes, pipe cutters, forges, grindstones, and, indeed, every kind of a machine that would possibly be needed that is capable of operation on board ship. The vessel contains, besides the workshops which are located on the third deck, a large stock room, blacksmith shop, foundry and machine shop, and two steam cranes with 10-foot arms, for transferring machinery from the disabled vessel to the repair ship.

In the workshop there are five lathes of various sizes from 15-foot bed and 9-inch centers down to 3½-foot bed and 6-inch centers; two drilling machines, planing, slotting, shaping and punching machines, and a circular-saw bench, a carpenter's bench, fitters' benches and an air furnace capable of melting down two hundred weight of scrap steel in two hours. In the blacksmith shop, on the upper deck, is a powerful hydraulic forging press, a large forge fitted with blower and steam blast, a coppersmith's forge and pipe-bending machine, together with a complete set of tools.

Besides the machine tools she carries a very large and fine lot of stores and supplies—almost as complete as will be found in a navy yard. This includes steel and bronze rods for torpedo boats—in fact, a whole supply store.

The Vulcan made many repairs to our vessels and has proved a valuable assistant in the wrecking operations on the Spanish cruisers. For supplying fresh water to the various vessels she is equipped with evaporators and distillers having a capacity of 10,000 gallons a day.

The nature of the vessel necessitates its presence with the fleet in every engagement, and though it is intended for her to follow in the wake of the battleships, yet it is quite necessary that the vessel should be equipped for both offensive and defensive work.

Several nations have repair and store ships attached to their fleets, but they are more for the repair of torpedo boats and cannot be called machine shops. The name of the repair ship of the British navy is the Vulcan; of the French, the Foudre; of the Austrian, the Pelican.

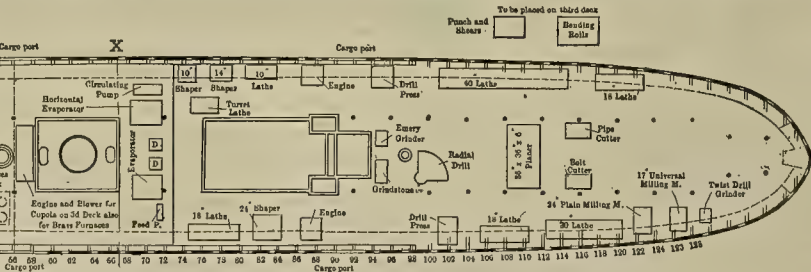

The illustration herewith of the side elevation and general plan are from drawings furnished by Commodore Geo. W. Melville, Chief of the Bureau of Steam Engineering, U. S. N. So valuable have been the services of the Vulcan that the Navy Department has decided to build a duplicate ship, to be ready for a future emergency. Now that in addition to the squadron in the Philippines under the command of Admiral Dewey comes the present transit there of the battleship Oregon and the Iowa, it would be in order for the U. S. Government to have a repair ship similar to the Vulcan equipped and sent to Manila.

During the past week the Vulcan has aided in raising the Spanish cruiser Maria Teresa, sunk by American guns off Santiago July 3, and now floated by her recent antagonists.

Lead Production in the United States.

Washington, D. C., reports that the total production of lead in the United States from all sources during the first six months of 1898 was 156,113 net tons, as compared with 239,558 tons during the entire year 1897, and 264,994 tons in 1896. This includes soft lead, hard lead and metal obtained by smelting foreign base bullion and ores in bond. During the first half of 1898 there were exported 31,439 tons of lead from foreign base bullion refined in bond, and 7308 short tons of lead from foreign ores smelted in bond. Reports from nearly all the important producers show a decline in stocks from 17,608 tons on January 1st to 16,760 tons on July 1st. The estimate for consumption for the first half of 1898 is 118,767 short tons. The figures presented indicate an increased production in this country, balanced fully by a notable growth in the consumption, which is at the rate of 237,000 tons per annum.

chines, made almost entirely in machine shops of various kinds, and requiring the facilities of a machine shop remarkably well equipped to keep them in repair. So many apparently trivial things may

PLAN SHOWING ARRANGEMENT OF THE PRINCIPAL TOOLS OF THE VULCAN.

a fair profit. The pyritic matte smelter at Silver-ton, with a capacity of 150 tons per day, whose main dependence for copper and iron ores was from Red Mountain mines, has not operated this year. Apparently the supply of this class of ore was insufficient for a plant of this capacity. Formerly the smelter owners operated the Yankee Girl on Red mountain, which furnished the principal supply of ore; but this mine is said to have been worked down to the water level, and it must be drained before producing further.

In no other part of the State are veins of ore so readily found as in the San Juan region. The mountain peaks and ranges are lofty and the slide and wash therefrom leave the well-defined fissures exposed. As a rule, the workings are not deep, but great depth can be gained without sinking below the level of the Animas river.

On the Silver Lake, Iowa and Royal Tiger, in Silver Lake basin, there are not less than 500 men employed.

One cannot help being impressed with the vastness of this mineral region and its possibilities. It is being gradually but surely conquered. Silver-ton, Colo., Sept. 12th, '98. WASCOTT.

happen to the machinery that will render a ship of little fighting account without repairs which cannot be done on board, that it is readily seen how absolutely necessary some shop, easy of access, is to a fleet. The only way to secure this under all circumstances is to float it and send it with the fleet. A machine tool will work about as well on ship board as on land, if properly secured, and a method of power transmission adopted that is reliable.

The repair ship Vulcan, shown in the accompanying illustration, was formerly the property of the Merchants' and Miners' Transportation Co. of Baltimore, and was known as the steamship Chatham. The vessel is 285 feet long, 40 feet beam, 25 feet 4 inches in depth, and weighs 1900 net tons, or 2729 gross tons. The vessel is of iron, with five watertight compartments, and has a compound engine with cylinders 40x72 inches and 48 inches stroke. For the variety and excellence of her tools, it is claimed that the vessel can only be surpassed by the larger navy yards, while her equipment is superior to that of the shops found in small ports. The tools and machinery alone represent an outlay of over \$300,000, and are said to weigh something over 100 tons. Nothing is lacking for repairing any part of a

Kryolith—Its Mining, Preparation and Utilization.

The mineral kryolith is the double fluoride of sodium and aluminum, $6\text{NaF}, \text{Al}_2\text{F}_6$: sodium, 32.86 per cent; aluminum, 12.86 per cent; fluorine, 54.28 per cent; sometimes carrying sesquioxide of iron as an impurity. It crystallizes after the monoclinic system—occurs both in the crystalline and massive forms, usually in the latter. It is snow-white to smoky-dark in appearance; cleaves in three directions, showing rectangular cleavages; is brittle, with an uneven fracture; is translucent, and has a vitreous to greasy luster. It has a specific gravity of from 2.95 to 3.0, and a hardness of 2.5. It is fusible in the flame of a candle, its melting point being between 900° and 1000° Celsius. It is soluble in sulphuric acid with the evolution of hydrofluoric acid. Its solubility is one part in 2730 at 12°C .

The deposit of kryolith discovered by Giesecke, at Ivigtut, southwest Greenland, is the only one of commercial importance known at present, and no indications of its existence at any other locality in Greenland have been discovered. Comparatively small quantities have, however, been found at Miask, in the Ural mountains, between Russia and Siberia, separated from the civilized world by 1000 miles of desert; also at the northeast base of St. Peter's dome, in the Pike's Peak region of Colorado, and lately it has been reported from the Yellowstone National Park, Wyoming.

Kryolith was at one time the chief source of aluminum, remaining so until superseded by bauxite. It is still used in the production of this metal, but not as a source of supply. Aluminum was first obtained from kryolith in 1855, by Allan Dick, who fused the mineral with alternate layers of small pieces of sodium, in a magnesia-lined crucible.

The principal use for kryolith is found in the manufacture of soda and the by-products resulting therefrom. From no other known substance can soda be obtained with equal cheapness and abundance; and it is the only natural product, excepting salt, from which this commodity can be procured in quantities sufficient to supply the demands of commerce. The process by which soda is obtained from kryolith was devised by Prof. Thomsen, of Copenhagen, in 1850. Ivigtut (an Eskimo word, meaning "a meadow") is in latitude $61^\circ 10'$ north, longitude $48^\circ 10'$ west, being a spot of land on the Arksuk Fiord, twenty miles from the coast line of southwest Greenland—a remote and gloomy region of the globe, inaccessible during the greater portion of the year, and barren of all commercial products, save kryolith.

The inhabitants of Ivigtut are solely the officers and men who operate the mines, all of whom are from Copenhagen. With but one or two exceptions, there are no women at Ivigtut. The food is almost exclusively supplied from Copenhagen, and consists chiefly of rye bread and salt meat, with fresh meat once a week. The nearest Eskimo settlement to Ivigtut is at Isua, eight and one-half miles distant. As though with a view to insure the speedy discovery of this unique and most remarkable mineral occurrence, nature signally marked the spot with a giant monolith of spotless kryolith, which, carved through countless ages by glacial action, stood, a towering monument upon the buried treasure beneath. It further revealed itself by a series of graceful undulations separated by green sward. Its resemblance to snow was, indeed, so great, that one can readily appreciate the Eskimo belief that it was such, though of a special kind that would not melt.

Remote from civilization as is the location of this isolated deposit, at no other point, in Greenland, at least, could it have been more accessible for removal, no portion of the mineral being at a greater distance than 150 feet from low-water line, and its general elevation not exceeding 10 feet from high water. Its greatest length extends in a direction parallel to the sea in a line running northeast and southwest, covering a distance of about 400 feet, 100 feet of which is washed by the sea. That portion nearest, and facing the sea, descends perpendicularly to an unknown depth; that farthest from the water sinks at an angle of about 45° from the sea.

The deposit of kryolith, at Ivigtut, is owned by the Danish Government. The mining of the mineral is conducted exclusively by a Copenhagen company, by virtue of a lease held by them from the Government. By the terms of this lease, the value of every fifth cubic fathom of kryolith, mined and shipped from Greenland, falls to the Danish Treasury of State, whether the cargo be lost on voyage from Greenland or not. These kryolith mines were opened by Daniel Schmidt, in the year 1858. The first cargo of commercial note was shipped from Ivigtut to Copenhagen, in 1857, on board the bark Christian; the first shipment to the United States was made in 1864, consigned to Philadelphia. In January, 1865, a contract was completed with Handels Selskabet, of Copenhagen (operators of the mines at Ivigtut), by which the Pennsylvania Salt Manufacturing Company, of Philadelphia, became possessed of the exclusive privilege to import the mineral, from this deposit, into the continents of North and South America.

That portion of the mine, which may more properly

be termed the quarry, at present measures about 300 feet in length, 150 feet in width and 120 feet in depth. Three holes have been sunk still deeper into the mass, for the purpose of investigation. The deepest of these is now about 120 feet below the bottom level of the quarry, but even at this depth there are no indications that the lower boundary of the mineral has been approached.

During the summer season, which lasts about April to November, about 140 men are employed in quarrying, mining, sorting and piling the kryolith. The drilling is done by hand, no steam drills being used, and the mineral is dislodged by blasting. It is carefully sorted into two grades, Nos. 1 and 2, of about 99 per cent and 92 per cent, respectively, which are taken to the top of the mine in two-ton cars, running on an incline railway operated by steam. The kryolith is carefully and accurately formed into piles of exactly 100 feet long, 20 feet wide and 4 feet high, containing 8000 cubic feet, or about 37 cubic fathoms. The cubic fathom constitutes the unit used in estimating the quantity shipped, the more general practice of weighing not being adopted at Ivigtut. The weight of a cubic fathom of kryolith is 13.6 tons of 2240 pounds. The greatest quantity of kryolith taken from the mines, in any one season, was that removed during the season of '97. It amounted to 13,000 tons, of which 10,500 tons were received at Philadelphia. The best grade goes to Copenhagen; the second quality to Philadelphia. The waste, including everything taken from the mines except the kryolith, is dumped into the sea, after a regular system, for the purpose of building wharves, and securing more reachable anchorage. This is desirable, owing to the remarkably precipitous character of the coast. Just before winter sets in, a sluice is opened, and the mines are flooded with sea water. The object in this is to prevent them from becoming inoperative through an accumulation

and a solution containing the soda salts. The insoluble fluoride of calcium is purified by washing and is ready for the market. The solution containing the soda salts is conveyed to agitators and agitated in contact with carbonic acid gas. During this operation the soda becomes united with the carbonic acid, to form sodium carbonate, still, however, remaining in solution. The alumina separates out as aluminum hydroxide, which, upon being purified by washing, is either converted into alum, or sold as alumina.

The solution containing the carbonate of soda is concentrated to about 36° Beaume, and the salt allowed to crystallize out, thus finally becoming the sal soda of commerce.

If it be desired to make the bicarbonate, this last product is exposed to an atmosphere of carbonic acid gas, of which it absorbs another equivalent, and yields its water of crystallization.

In the manufacture of aluminum, kryolith is used in the fused bath as a solvent, into which is introduced pure alumina, to the extent of about 21 per cent of the weight of the kryolith (this being a much greater amount than it has been found possible to introduce in any other available substance). By electrolysis, the alumina is decomposed into its component parts, the oxygen uniting with the carbon, furnished by the highly-heated carbon electrodes, to form carbon monoxide, which escapes and burns at the surface of the bath to form carbonic acid gas, the aluminum being deposited at the bottom of the furnace.

Modern Round-House Turntable.

Economics of railway management do not end with the adoption of the high-pressure compound locomotive, or the other contrivances born of necessity, but go on finding a way to eliminate all unnecessary expenditure. The latest economic development is the

THE MODERN ROUND-HOUSE TURNTABLE OPERATED ELECTRICALLY.

of ice and snow, which the whole of the summer's heat would not suffice to melt. The force of men is then cut down to about seventy, whose efforts are chiefly confined to the quarrying of such of the kryolith as can be reached, allowing it to accumulate for removal the following summer. Rails have been laid during the winter upon the ice in the quarry, and the whole operation carried on the same as in summer, except upon a much reduced scale. This, however, has not been found to be thoroughly practicable. As soon as the general thaw takes place, steam pumps are put to work, the mines drained of water (an operation requiring about three weeks to perform), and work is again resumed in earnest.

The vessels employed in the kryolith trade are staunch seacraft, built expressly for the purpose. The Philadelphia fleet musters eight barks, having an average burden of 800 tons; while three small vessels, with an average of 300 tons burden, comprise the Copenhagen fleet. These make two trips to the mines a year, arriving at Ivigtut, on the first trip, about April 10th, and again, on their second one, July 10th. Owing to the lack of reciprocity, these vessels usually make their outward voyages in ballast.

In producing soda from kryolith, Thomsen's method is still employed. The process briefly is as follows:

The previously dried and pulverized kryolith is intimately mixed with an equal weight of powdered limestone, and the mixture calcined at an incipient red heat, during which there is formed calcium fluoride, aluminate of soda, carbonate of soda and sodium hydrate. The calcined residue, known as "kryolith ash," is then subjected to careful leaching, yielding an insoluble residue of calcium fluoride

adaptation of the electric motor to turntables. The device and the method of operating it is illustrated herewith.

It is the product of the Westinghouse Company, and consists of a reversible 10 H. P. motor, mounted in a cast iron frame, with a traction wheel resting upon the rail of the turntable pit. Power is transmitted to this wheel through double reduction gears. The donkey frame is connected by draw-bar and pin to one end of the turntable at the side, sufficient traction for the driving wheel being secured through the weight of the machine, which is 3700 pounds. Wires are run from the donkey to a small platform, on which is a controlling rheostat. By means of this the donkey may be operated in either direction by moving a single lever to one or the other side of a neutral point. Current is supplied by wires brought to a suitable contact overhead and then led to the controller.

In one of the installations, located at an important division point, it was necessary to turn 176 engines each twenty-four hours, or about seven per hour. Previous to installing this donkey, push poles were used, requiring the services of four men, and the operation was a slow one at best. Now, one man does the work in a much shorter time. With the turntable light, the donkey will make a complete revolution in thirty seconds; with a 10-wheel locomotive on the table, weighing, with tender, 100 tons, a complete revolution is made in forty-five seconds.

It is stated that actual tests have shown that the power consumed by the electric donkey is the equivalent of one-half H. P. per hour. Assuming six pounds of coal per H. P., with coal at \$2 per ton, the cost of turning each locomotive would be three-tenths of a cent, or 53 cents for 176 locomotives.

Coast Industrial Notes.

—Sell a man what he wants; if you try to convert him, he will buy elsewhere.

—Coalinga, Cal., announces a new oil well, the flow of which is 700 barrels per day.

—September rains have revived the hopes of the California miners and agriculturists.

—It is again asserted that the Union Pacific and Oregon Short Line will consolidate.

—Grass Valley, Nevada Co., Cal., figures on putting in a \$37,000 sewer system. It needs it.

—The Great Northern Express Co. has taken hold of the Oregon Railway & Navigation system.

—A Prineville, Or., firm has shipped 73,000 sheep to Chicago from Baker City, Or., valued at \$150,000.

—It is locally figured that 17,000,000 pounds Oregon and Washington wool remain over from last year's clip.

—The Union Iron Works of San Francisco has a further U. S. government contract for three torpedo destroyers.

—A new submarine telephone and telegraph cable, 4000 feet in length, has been laid across San Diego bay, Cal., at a cost of \$6500.

—The Secretary of the Navy recommends for new works in the navy yard at Mare Island, \$31,750, and for Puget Sound, \$55,500.

—The earnings of the Mexican Central railway system for the second week of September were \$208,652—an increase of \$9137 over the same time in '97.

—The Marysville, Cal., *Democrat* estimates the amount paid for hop picking this season at Wheatland, Cal., on a basis of 90 cents per 100 pounds, at \$53,181.20.

—Oregon's hop crop for 1898 is estimated to represent \$1,300,000, the yield being 60,000 bales, or 12,000,000 pounds. The prices quoted are from 8 to 12 cents.

—The southern California citrus fruit crop amounts to 15,000 carloads, of which 14,000 carloads were oranges and the remainder lemons, representing \$4,000,000.

—The United States government will build a coaling station at Mission Rock, in San Francisco bay, where battleships can safely coal and take on supplies.

—Puget sound lumbermen will build another sea-going raft of the same size as the two towed to San Francisco this summer and will contain 4500 M. feet lumber.

—The \$343,000 Los Angeles, Cal., 4% twenty and one-half-year average various bonds have been awarded E. D. Shepard & Co., New York, at 105.25, an income basis of 3.635%.

—Over 200 people are employed in the cranberry marsh at Ilwaco, Wash., picking. They are paid 50 cents per box of sixty pounds. It will take six weeks to harvest the crop.

—The gross earnings of the Mexican National railway for the second week in September are given at \$108,510.46—an increase of \$12,406.92 over the same period last year.

—Locomotive engines were imported to Yokohama in 1897 to the value of \$316,415. While the United States shared this trade with Great Britain, the latter had the larger proportion of it.

—Of the dynamo electric machinery imported to Yokohama in 1897 the United States supplied nearly seven-tenths of the total, Germany and Great Britain sharing about equally in the remainder.

—The Manufacturers' and Producers' Association of California has resolved that in its opinion the connection of the United States with the Philippines should be in such form as would protect our people and their industries.

—Compared with previous reports, California's prune crop shows a considerable shortage. The yield early in the season was estimated at 100,000,000 pounds, but now the estimate has been cut down to 60,000,000 pounds.

—The California & Oriental Steamship Co. will operate a line of steamers between San Diego and Hongkong, using three vessels from 4500 to 6500 tons and beginning December next. The Santa Fe road has a contract with them for shipping freight.

—Merchants of Canton, China, who do business with the United States, have protested to the United States Consul against the appointment of F. R. Williams as Vice-Consul on the ground that they do not wish to have all their invoices examined by a competitor in business.

—The Philippine National Assembly has decided to request the Americans to recognize the independence of the islands; to establish a protectorate over their internal affairs; to induce the powers to recognize their independence, and to appoint a joint commission to arrange details to "reciprocate the American's services."

—Dawson is to have electric lights this winter. A full plant, including five dynamos and apparatus for operating twenty arc and 3000 incandescent lamps, is being taken north on the steamer Dirigo. The outfit weighs thirty-five tons. There is a small outfit already at Dawson, which was expected to be operating 800 incandescent lamps by September 15th. The charge for the arc lamps will be \$14 a day and for the incandescents 50 cents.

—The Pacific Coast Co. (successor to the Oregon Improvement Co.) for the seven months ended June 30th shows gross earnings \$3,081,502, operating expenses and taxes \$2,395,145, net income from operation \$686,356. These results are attributed to the fact that the reorganization committee and the company have established close relations with the dominant transportation interests in the Northwest, and to the general revival of business in the territory tributary to Puget

sound. Alaska business has not been so vital in the matter as has been supposed.

—At Oregon City, Or., the falls of the Willamette furnish the power to run paper mills, woolen factory and the electric power company plant which furnishes all the electric power for Portland, fifteen miles distant. The woolen mills employ 300 men and women, the paper mills 400 men. The common laborer in the paper mills gets \$1.50 per day of ten hours and women in the woolen mills from 75 cents to \$1 per day. The work is very hard and nearly all the men are required to work seven days in the week.

—United States Consul Bedloe at Canton, China, says that the Russian method, if enforced in China, will injure our trade in oil, flour, piece goods, and other products we send to China, when once the Russians have completed their railway across Siberia and are in a position to supply the Chinese markets with products of their European factories. Counterfeiting, imitating and false labeling in China are not confined to unscrupulous people in the oil business; immense quantities of goods "made in Germany" and also from Belgium, and "Fairbanks" scales made in Osaka, Japan, are sent to China and palmed off as American products.

—The American syndicate which proposes to build a railroad from Hankow to Hongkong, China, is sending a corps of engineers and other officials, who will make the survey, beginning at Hankow and extending to the city of Canton and thence to Hongkong. There are in the syndicate seven representatives of the Vanderbilt interests and three of the Standard Oil Co., Levi P. Morton, Geo. T. Bliss and the officials of the Carnegie Steel Co. The cost of the road is estimated at from \$30,000,000 to \$40,000,000. The provinces through which the road will pass are the most populous in China, having a population of 300,000,000. Two of the provinces through which it passes have a population greater than that of the United States.

—On the most northerly railroad in the world, the Norton Bay & Yukon, all the preliminary work for road building is completed. Surveys have been run the entire distance from Gardner City on Norton sound to Blair, or Caltag, on the Yukon. Some of the problems that must be met between now and the time the ice goes out of Bering sea are difficult, but with plenty of money they will be solved. The engineers of the Norton Bay & Yukon Railway and Transportation Co. have completed the survey of the entire line from the starting point on the shore of Bering sea to the Yukon river terminus. The highest grade is $1\frac{1}{2}$ per cent and there will be no rock work. The proposition now is to send north 4000 Italians from San Francisco to work under contract for the season.

Personal.

A. J. BOWIE has returned to San Francisco from New York City.

E. BIND, managing owner Blue Gouge mine, Placerville, Cal., is in San Francisco.

S. LOOK, an extensive mine operator at Washington, Cal., is in San Francisco.

S. W. DORSEY of Denver, Colo., is examining mining properties in southern California.

EX-GOV. COLCORD of Nevada has been appointed Supt. of the Carson, Nev., mint.

D. J. McFALL, Supt. Home M. Co., Nevada City, Cal., has returned from San Francisco.

ALF. TREGIDGO has returned from a week's sojourn in Nevada county, Cal., to San Francisco.

J. F. KIDDER, California State Debris Commissioner, is in San Francisco from Grass Valley, Cal.

J. J. MARTIN, Supt. Seattle M. Co. property, Jacksonville, Or., has returned from Seattle, Wash.

EDW. B. NORTON, Sec'y and Treasurer Oakland Iron Works, is on a business trip through British Columbia.

E. W. ROBERTS, Oakland, Cal., is examining mining properties with a view to purchase near Grants Pass, Oregon.

J. KAENE of Redding, Cal., largely engaged in developing mining properties in Shasta county, is in San Francisco.

A. HARRISON THOMAS, B. Sc., has been appointed California agent for the Bennett Amalgamator Co. of Denver, Colo.

J. H. MEANS of the Cal. State Mining Bureau has returned from a reconnaissance of the Santa Barbara, Cal., bitumen deposits.

C. B. WINGATE, San Francisco, managing owner Chloride-Bailey mines, Dedrick, Cal., is at the mine and will remain several weeks.

CHAS. BUTTERS of San Francisco has been examining the Sunshine mine at Mercur, Utah. His experimental cyanide plant, erected at a cost of \$50,000, is about completed.

J. R. TREGLOAN, Supt. South Spring Hill mine, Amador City, Cal., has returned from San Francisco. Mr. Tregloan has received the Republican nomination in his district for State Assemblyman.

IRVING M. SCOTT has returned from an extended European tour, during which he visited several ship-building establishments. He found the great battleship Oregon had attracted universal interest, but believes that her remarkable record only indicates what can be done in that regard. The performance of the San Francisco built ships at Manila and Santiago has greatly increased European respect for the American navy.

COL. CHAS. R. SUTER, Corps of Engineers, U. S. A., who has been president of the California Debris Commission for the past two years, in conjunction with his duties as division engineer of the Pacific division, having been relieved from his present duties, to take effect October 15, 1898, will proceed to Boston,

Mass., and there relieve Col. Samuel L. Mansfield of the duties under his charge. Upon being thus relieved Col. Mansfield will proceed to San Francisco and assume the duties vacated by Col. Suter.

From Alaska, on the steamer Bertha, last Wednesday, came L. N. McQuesten, "the father of the Yukon." He is an old experienced miner, and was in the Frazer river rush forty years ago. He worked for the Alaska Commercial Co. nearly twenty-five years, and at the start of the "rush" of '97 was in business at Circle City. He got in on some good things in the Klondike, and is tolerably well fixed. He brought down his family this time, servants, dogs, etc., and a little matter of \$300,000 in gold and drafts. He says that he is not going back any more, and that California is good enough for him.

J. W. MACKAY has returned East via Winnipeg, where he became reminiscent and said: "A few years ago I was strolling with friends in Virginia City, Nevada. My friends were looking down a smoking cavity in the ground, whose bottom was soon lost in the darkness, at the mouth of which a windlass was slowly grinding. When I came up to them I said, casually, 'Out of that hole I took \$150,000,000 in bullion.' It was one of the famous bonanza mines, and was a 'kidney' or 'pocket' of crude ore about as high as the steeple of Trinity church, New York, and in area as large as the city hall park of your city. I do not know of any laws in mining the application of which would lead to the discovery of other bodies of ore like the one I mentioned. Nature had in a prodigal mood buried this 'kidney' in the Nevada, and perhaps she may not have been less niggardly in British Columbia. But there is no law in mining but the pick."

MR. WM. SCHAW of the firm of Schaw, Ingram, Batcher & Co. of Sacramento, Cal., has returned from England, where he went to bid on the steel pipe contract for the Coolgardie, Australia, water system, 323 miles in length. The bids were opened in London August 23rd, but up to the time of Mr. Schaw's leaving (September 8th) no decision had been arrived at. He found it quite impossible to get any positive information through the office of the agent general of Western Australia, or the office of the consulting engineer in charge of the work. He did, however, receive a hint, which is entirely unofficial, that the bids had been forwarded to Australia, and would probably be acted upon by the local officials there. The contract attracted the attention of the principal manufacturers in Europe and America, and in consequence a large number of bids were received. Mr. Schaw believes that at least a portion of the work will come to the United States.

DR. C. F. KRAFT has returned on the Excelsior from the Port Valdes country. He went north in April, '98, with four others, representing the Alaska Geological Society, visiting different sections along the coast from Port Valdes to points on Prince William sound. He is disgusted with the Copper river district, but staked out some claims on Algenic river, a tributary to Copper river. On the Copper color could be found on the surface, but after the hole is sunk lower the color disappears. He says: "I would not advise any one to go to Copper river. Around Valdes the prospects are good. The formation is a dark slate, and the color improves the deeper you go. On account of the tremendous flow of water from the glaciers now is the best time to prospect, as the ground is becoming frozen. Very few have prospected deeper than 3 feet, but this winter there will be a large amount of work done. I do not think there will be any need of people starving there, as there is any amount of abandoned outfits. For \$15 one can buy an outfit. Flour is only 85 cents a hundred. Bacon is a drug on the market."

R. L. DUNN, a California mining engineer, who has been investigating the Yukon country, has returned to San Francisco. He says: "The country as a whole, in my opinion, is over-estimated; that is to say, the districts that are gold-bearing are not as numerous as is popularly believed. The mere fact of the existence of traces of gold in the shape of colors of gold on the surface has been the foundation for the belief that good placers could be found almost anywhere. These surface color prospects, however, are simply the work of glaciers, and are found in the enormous masses of glacial drift, gravelly and rocky, that fill many of the valleys and the streams. There is no possibility of good placer ground in any of this glacial wash. Aside from that, the placers that are being worked and are being discovered are exactly like placers in other gold-bearing regions of the world. Some are very rich and others only moderately so. Klondike placers are not a fair basis for estimating that country. There is really nothing remarkable about this great gold yield. In Siberia at the present time there are placer localities that are making just as large yields as those in the Klondike. The early-day placers of California, Idaho and Montana were very much richer. The idea that the gold of the Klondike was brought there by glaciers is entirely wrong. It is just exactly as placer gold is everywhere, the concentration by flowing streams. I think the country is getting down to a business basis in mining. The enormous waste of the product in the cost of getting it out is being done away with. Wages are going down to reasonable figures, the cost of supplies and material is much less. I consider the Canadian laws restrict the development of the mines. No gold mining industry in the world can stand a permanent drain of 10 per cent of its gross product as a royalty charge. A few individual mines can for a short time, but the application of the royalty charge to every mine, regardless of its possible profit of operation, has simply the effect of limiting the number of mines. The conditions for successful mining, in my opinion, are very much better in American territory. The claims on the Canadian side are altogether too small, and

the fees and charges and regulations are too onerous. On the American side the law leaves the way open for the miners to modify the general laws by making local laws to suit the local conditions. As a field for investment, I regard the coast region of Alaska as one of the best in the world, very much superior to the interior in its opportunities for profit. The climate and transportation conditions are very favorable on the coast, and admit of all the year round operation of mines. Prospecting in this region I regard as only begun. There are immense bodies of low grade ore which only require systematic exploration to develop into large mines."

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

APPARATUS FOR MAKING GAS FROM OIL.—F. L. Martenette, Chico, Cal. No. 610,994. Dated Sept. 20, 1898. This invention is designed to generate gas from oil. It consists of a furnace, a heating coil contained therein, a chamber adapted to receive liquid to be vaporized, an air-forcing mechanism connecting with the chamber so as to exert a pressure therein to force the liquid from the chamber and through the coil, a pipe connecting the chamber with the coil and a delivery pipe jet nozzle, a second coil within the furnace directly above the first-named furnace conveying air and delivering it into the discharge pipe with the discharge from the first-named coil.

SWIMMING APPLIANCE.—Samuel Stone, Quilayute, Wash. No. 611,005. Dated Sept. 20, 1898. This invention relates to an apparatus which is especially designed as a life-jacket for persons who may be thrown into the sea, and in combination therewith of a means by which persons can propel themselves through the water. It consists of hinged sections, closable about the body, having an extension forward to which an arm is attached, with means for supporting a sail or awning, and a flexible rod extends rearwardly with a propeller carried upon the rear end, a means for operating the propeller so that the person can drive himself and the apparatus through the water at a considerable rate of speed.

FEATHERING PADDLE WHEEL.—Daniel Abbott, San Jose, Cal. No. 611,007. Dated Sept. 20, 1898. This invention relates to a means for turning or feathering the paddles of wheels which are designed to propel vessels through the water, so that the blades are retained in a vertical position while passing through the water and turned to the position of least resistance while passing through the air. The floats may also be so changed that while one wheel is operating to propel the floats of one wheel, the other may be turned to the position of least resistance in the water to assist in turning the vessel. The floats have central end pivots, about which they are turnable in rims, which are mounted upon the driving shaft, and bands extend around the wheel having lugs, which alternately engage slots upon the edges of the floats, the band traveling at a different rate of speed from that of the wheel so that the lug on the band and the slot in the lower edge of each blade are engaged to retain the blade in a vertical position while passing through the water, and disengaged after the blade leaves the water, the lug in front being engaged so that the blade lies flatwise while passing over the top of the wheel. By means of a reversing mechanism, the position of the parts may be so changed that the movement of the floats will be reversed from the top to the bottom of the wheel.

ROTARY SAND PUMP.—John Mann, Butte City, Cal. No. 610,992. Dated Sept. 20, 1898. This invention relates to an apparatus which is especially designed to raise sand, gravel, etc., where there is too much water to be handled otherwise. It comprises an irregularly-shaped oval casing, having a shaft extending through the sides with arms fixed to the shaft extending tangentially outward and having the outer ends bent at right angles, with hook-shaped ends. In combination with these are angular plates, one end of each of which engages one of the hook-shaped ends, the other ends being bent to form a segment, which travels in contact with the inner periphery of the rim of the casing. When the shaft is rotated these plates move and act as suction pistons to draw in the sand through the inlet and discharge it through the outlet passage of the casing.

RIFLE ATTACHMENT FOR SHOTGUNS.—H. A. Darms, Napa, Cal. No. 611,062. Dated Sept. 20, 1898. The object of this invention is to provide an insertible supplemental barrel, which may be placed inside of a shotgun barrel and receive ball cartridges, which are fired by the fire mechanism used by the shotgun, thus enabling the shotgun to be converted into a rifle at any time by simply inserting this barrel. This interior barrel is of less diameter and considerably shorter than the shot barrel. It has enlarged ends, which fit the interior of the outer barrel and the cartridge chamber of the same, and thus center the rifle barrel exactly within this interior barrel. A chamber is formed within this interior barrel for the reception of a rifle shell and ball and slides are arranged upon this barrel with lugs, which engage the rim of the shell and are themselves engaged by the extractor upon the shotgun, so that the rifle shell may be extracted after the discharge of the gun. By a connecting ring, turnable upon the outer exterior of the rifle barrel, these slides may be so locked that the shotgun extractor will act when desired to draw out the rifle barrel itself; the rifle barrel, being short, can be easily carried about when it is not needed and inserted whenever it is necessary for use.

Is Darwinism True?

W. S. PROSSER.

NUMBER VI.

The embryos of higher animals show "reminders" of lower, but with something added. The self-binding reaper has the sickle, wheels, etc., of the grass mower, but with several new inventions added. The most sensible way was to retain all parts of the mower that could be done; but only an inventor and a mechanic could add the new parts. The testimony of the embryo, then, is that an inventive intelligence used, for economy of effort, certain lower forms in creating higher, but adding new devices. It is plainly impossible that the old forms could add to themselves new things, subordinating and superseding themselves. Just as impossible as it would be for the scythe to invent and construct the mower, and then voluntarily retire and hang itself in the tree, as obsolete.

As one of the choicest proofs of common descent the human embryo is often cited: as going through stages corresponding to the distinctive steps of creation—invertebrate, fish, amphibian, reptile, mammal, human. This embryo has, at the fish stage, the vitelline circulation; at the bird and snake stage, the allantoic; at the mammalian stage, the placental. The world has been challenged to choose between accepting these facts as proofs of evolution by natural generation, or passing them as "unexplainable mysteries," as "special creations."

The three circulations afford clear disproof of evolution. How does the vitelline give way to the allantoic, and that to the placental? One does not change into the other, or assist in the formation of the other, in any way. Especially do the former two differ from the last one: they derive air and food from the surrounding fluid and from the yolk within: the placental does neither, but furnishes ready-made blood.

The gap is unbridgable. Not to clearly show how one device can perish utterly, while another, absolutely different in principle, in detail, and even in place, succeeds by "natural selection" and "survival of the fittest," is to commit the absurdity of explaining everything except the only thing that needed explanation. It would be childish to account for the origin of the mower by saying that "once upon a time" a farmer's scythe wore out, but at that exact moment a perfect (though hitherto undreamed of) machine just happened in another part of his field; and began to mow. To commemorate that happy event every farmer begins to cut his crop with a scythe, and breaks it at the exact day and hour that the first man did; and new mowers begin promptly to work. And just as the wheat got ripe, a new self-binding reaper just happened also. These might pass as fairy stories, but hardly explain the origin of the inventions. Yet if they are any more unreasonable than Darwin's supposed explanation, I would like to have it pointed out.

It is seriously claimed that the vitelline and allantoic devices are in mammalian embryos, because they were in the fish, etc., because they are indelible marks of something prior. If such a claim means anything it means they are so used because to drop them is impossible, which by the theory itself is absurd. If nature could change a butterfly into an elephant, it ought to be able to omit a few veins in an egg. If a woodsman has three axes, it would not require great genius to lay two of them aside, even if his father and grandfather did use all three.

The allantois absorbs the yolk and nourishes the young chick for a day or so (a wise plan because the eggs do not all hatch at the same hour), although the digestive organs are all ready for use. The atrophy of the allantois, when the yolk has been absorbed, is easily understood, as it could not act longer having no more yolk to act upon; but the origin, out of the allantois or out of anything else, of an entirely different and very complex set of organs, is not; and no amount of vague talk about "variation" or

"natural selection" goes one hairs-breadth toward an explanation. There being in the beginning no heart, internal organs, lungs, etc., something had to be used to feed the germ (device A); afterwards other devices more complex (B and C). It seems very plain that A and B were used permanently in simple animal forms, and temporarily in simple embryonic stages for the same reason: the reason that runs through the whole animate creation: the reason why a mechanic does not use a complex machine if he finds a simple one to do the same work. The simpler needs less power, and is less liable to derangement.

The human embryo has at first a heart of one cavity, like the lancelet; then with two, as fish; then three—one auricle and two ventricles—while reptiles have one ventricle and two auricles, a difference small, but great enough to dispose of the idea of descent, and to indicate that the embryonic heart has one, two, and three chambers, just according to embryonic needs, and not that it had anything to do with some imaginary event ten million years ago.

(To be Continued.)

New Style Crushing Rolls.

On this page is an illustration of a new style of crushing rolls, made by Fraser & Chalmers of Chicago, in which the rolls are held to their work with a uniform crushing pressure by nests of springs that do not have to be disturbed for the removal of shells, rolls or shafts, their position being stable and unaffected by such changes. By

NEW STYLE CRUSHING ROLLS.

use of plates on the main bolts the rolls may be set apart positively to any convenient opening. The feed hopper is provided with inclined baffle plates, which distribute the material to be reduced, so as to furnish a more even feed. The cut shows the machine without the housing, which is indispensable for dry crushing, and is furnished when specifically ordered. The housing covers the rolls and prevents dust getting into the atmosphere or to the bearings. It is provided with plates and springs bearing against the inner sides of the frames, so that the housing has an elastic adjustment to conform with any movement of the roll bearings when these shift in their cylindrical seats, and thus remains dust tight in any case. The size illustrated, 30" diameter by 10" face, is of comparatively narrow proportions, which is considered favorable to evenness of feed, uniform wear and long service. These rolls run at the usual peripheral speed of 600 to 800 feet per minute.

THE Walker Electric M'fg. Co. has been absorbed by the Westinghouse Co. This leaves the field of electrical manufacture to the Westinghouse and General Electric companies, which have had a working agreement for a long time, and this transaction terminates a long series of litigation over patents.

Silver-Plated Copper Plates.

TO THE EDITOR:—In your issue of Sept. 10th "A '52 Miner" contributes a criticism on a "Concentrate" in the issue of Aug. 27th. While his remarks contain much useful information, he appears to have in mind only electro-silver-plated copper plates. Every mill man knows how difficult it is to keep those portions of such plates which have been denuded of silver free from the greenish film, or oxide of copper. It is more difficult than when the plate has never been electro-plated. While it is probably largely due to the causes set forth by "52," yet scouring or scraping the copper off below the oxidized surface only partially removes the difficulty, as the greenish film will continue to appear until the pores of the copper are permanently filled with gold or silver amalgam.

The "Concentrate," however, evidently referred particularly to copper plates, not electro-plated, in which case it is undoubtedly correct that the oxidation is in part due to copper in the amalgam, raised by the scouring the plates receive in preparing them for work. This may be proven by removing a portion of the amalgam and rubbing it on the lower part of an electro-silver-plated plate, where the gold will not accumulate rapidly enough to overcome it quickly. The surface of the copper, doubtless, also produces a certain proportion of this troublesome oxide.

The only permanent remedy known to the writer for the difficulty is to keep the pores of the copper filled with gold or silver amalgam. The richer the ore the more easily is this accomplished.

If the ore is poor, it can be most readily done when the plate is not in use, by applying the amalgam to its surface, first made chemically clean, and allowing it to remain undisturbed for a few days, if possible. If the plate must be in continuous use, it is best not to scour it up too much, once a perfect amalgamation with a chemically clean surface of the copper is obtained. "A '52 Miner" is right in stating "no acid should be used in dressing the plates." The practice cannot be too strongly condemned. The same is true of preparing them for electro-plating.

A '98 MINER.

Baker City, Or., Sept. 25th, '98.

Recent Additions to the Collection at the State Mining Bureau Museum.

Sapphires from the Shively placer mine, Rock Creek, Montana—J. T. Pardee.

Fine crystallized galenas and pyrite specimens from Shullsberg, Wisconsin, and a peculiar variety called "reticulated" galena.

Gold in ferruginous jasper, Capital mine, Lincoln Co., Nev.—John Apple. Fuller's earth of good quality from San Bernardino and Kern counties—S. S. Simon.

Gold quartz rich in free gold, Pueblo

mine, Humboldt Co., Nevada—J. H. Deegan.

Gold quartz: characteristic samples from the Arbona mine, Tuttle town, Tuolumne Co., Cal.—E. V. Burke.

Specular iron: peculiar variety called "rose" iron, the laminae being arranged like the petals of a rose, Geneva, Switzerland—Ferd. Burguet.

Ferruginous calcite and oligoclase feldspar from Vermont—Alfred A. Post.

Northupite (a very rare mineral) hanksite and halite in fine crystals and thenardite in large crystals and also crystallized in the shape of crosses, from Borax lake, Slate range, San Bernardino Co., Cal.—C. H. Northup.

Chalcedony geode, Bad Lands, South Dakota.

Chalcedony pebble, including water in which is a bubble of air which can be seen to move, Shoalwater Bay, Washington.

And some others of less interest.

HENRY S. DURDEN, Curator.

Some Electrical Facts and Figures.

In 1884 a 50 K. W. dynamo was considered a large machine, while a 100 K. W. Edison steam dynamo was justly called a "Jumbo." At the present time the largest size generator built or building is of 4600 K. W. capacity. The price of dynamos in 1882 was about 20 cents per watt of output, while dynamos of similar running speed in comparatively small sizes, without switchboards, now cost about two cents per watt.

The cost of generating a kilowatt hour of electric energy from steam for electric lighting appears to have been at least 7.5 cents at the 'bus bars in 1884. At the present time the cost of delivering a kilowatt hour to large street railway systems from steam is only about one cent, and the power house operating costs are reported in some cases as low as half a cent. In municipal electric lighting systems, supplied at low pressure from steam central stations and hampered by relatively heavy distributing expenses, the retail price of the kilowatt hour varies from 20 to about 4½ cents, according to the locality and quantity consumed. Niagara power is now sold to consumers in Buffalo at rates varying, according to amount delivered, from 2 cents to slightly less than two-thirds of a cent per kilowatt hour delivered.

The price of a 16 c. p. incandescent lamp sixteen years ago was \$1. Now it is about 18 cents.

Arc lamps were already so far advanced in 1884 that comparatively little improvement in their effectiveness has taken place, the gain having been made in economy of operation. Thus the carbons, which cost at that time about 6 cents apiece, now cost about 2 cents apiece. The enclosed arc lamp has of recent years become popular, owing to its diffused light and a carbon life of from 100 to 150 hours.

It has been estimated that about \$600,000,000 have been invested up to the present time in electric lighting stations and plants in the United States.

The best storage cells tested at the Philadelphia Exhibition of 1884 gave a yield, under laboratory conditions, of 3.4 watt hours per pound of electrodes, with an energy efficiency of 69 per cent when discharged at the mean current density of 12 amperes per square foot of negative plate surface; while the deterioration was comparatively rapid. At the present time storage cells are in use giving, under laboratory conditions, a yield of from five to six watt hours per pound of charged cell, with an energy efficiency of about 85 per cent, when discharged at a current density of 4.8 amperes per square foot of negative plate surface. There are now storage batteries installed in the United States to the aggregate capacity of about 56,000 K. W. hours. The largest installation has 166 cells, weighs 500 short tons, and has an eight-hour discharge capacity of 22,400 ampere hours, or 3136 K. W. hours at 140 volts pressure.—Dr. A. E. Kennelly, in Casier's Magazine for October.

Mining Summary.

ALASKA.

The Alaska-Treadwell G. M. Co.'s report is for the year ending May 31, 1898. During that time there were mined 254,329 tons of ore; of this amount 227,692 tons came from the 110-foot level and 26,637 tons from the recently opened 220-foot level. In addition 7,324 tons of waste rock were taken out. The cost of mining was 59.49 cents per ton.

Development work on the 110-foot level included 376 feet of drives and crosscuts and twelve upraises for chutes; on the 220-foot level 1832 feet of drives and crosscuts and forty-five upraises. The new main shaft was sunk 455 feet, and stations cut at the 220, 330 and 440-foot levels.

The reserves of ore in sight are estimated by the Supt. as follows: "Adit and 110-foot levels, 2,066,000 tons; 220-foot level, 2,411,500 tons; total ore reserves available for mill, 4,477,500 tons. The reserve ore is measured from the ends of the different east and west drifts. No account is being taken of the ore beyond the faces of the drifts; a fair percentage is also deducted from our actual measurements for waste material that may be in the ore. The fact of cutting the vein at the 455-foot level, exactly where it should be, enormously adds to the value of the mine. In fact, it would not be unreasonable to add 4,000,000 more tons of ore in sight in the mine."

During the year the mill of 240 stamps crushed 254,329 tons of ore, stowed out on the adit and the 110-foot levels, and extending down to the 220-foot level.

The chlorination works were kept steadily at work, three furnaces being run on the company's ore and two on ore from the Alaskan-Mexican mine. The concentrates (sulphurets) saved from the mill amounted to 4432 tons. The concentrates chlorinated were 4447 tons of the company's and 3261 tons for the Alaskan-Mexican Co. The total cost of the chlorination was \$60,329, or \$7.83 per ton treated. The company received \$10 per ton for the Alaskan-Mexican sulphurets, which made the net cost for treating its own concentrates \$27,713, or \$10.23 a ton. The cost of concentrating labor was \$1.67 a ton of concentrates, and a fair proportion of the cost of supplies brought the cost of the concentrates up to about \$4 a ton. The average return was \$4.33.

The earnings and disbursements for the year are shown in the following table:

| | Total. | Per ton. |
|------------------------------------|-----------|----------|
| Bullion sold..... | \$589,149 | \$2 3165 |
| Store profits..... | 29,090 | 0 1176 |
| Total receipts..... | \$618,058 | \$2 4341 |
| Mining labor..... | 97,173 | 0 0381 |
| Mining supplies..... | 54,149 | 0 2129 |
| Total mining..... | \$151,322 | \$0 5950 |
| Milling labor..... | 39,159 | 0 1540 |
| Milling supplies..... | 55,152 | 0 2168 |
| Total milling..... | \$94,311 | \$0 3708 |
| Chlorination of sulphurets..... | 27,713 | 0 1000 |
| Gen. expenses, Douglas Island..... | 12,575 | 0 0494 |
| Gen. expenses, San Francisco..... | 6,110 | 0 0240 |
| General expenses, London..... | 1,517 | 0 0060 |
| General expenses, Paris..... | 281 | 0 0011 |
| Consulting engineer..... | 1,438 | 0 0057 |
| Legal expenses, San Francisco..... | 2,195 | 0 0086 |
| New dividend warrant charges..... | 2,250 | 0 0088 |
| Bullion charges, freight, etc..... | 6,270 | 0 0237 |
| Total operating costs..... | \$375,797 | \$1 4776 |
| Construction costs..... | 99,815 | 0 2745 |
| Total costs..... | \$375,797 | \$1 4776 |
| Profit..... | \$243,261 | \$0 9585 |
| Balance from previous year..... | \$300,683 | |
| Total..... | \$443,924 | |
| Dividends paid 6 per cent..... | 300,000 | |
| Surplus, May 31, 1898..... | \$143,924 | |

Of the bullion reported, \$389,740, or \$1.53 a ton, was free gold from the mill; \$197,117—being \$44.33 a ton of concentrates, or \$0.78 per ton crushed—was from sulphurets; the balance of \$2292, or \$0.01 a ton, was in base bars from the mill.

The average number of employees, not including wood contractors and choppers, was 263 white men and 24 Indians. The average wages paid are as follows, board and lodging being furnished in addition to the money payment: Miners, \$2.50 a day; laborers, \$2; drillmen, \$2.50 in summer and \$3 in winter, with bonuses; concentrators, \$5 to \$100 a month; feeders, \$70; amalgamators, \$90 to \$100; roasters (in the chlorination works), \$2.60 a day; helpers, \$2; floormen, \$3; mechanics in the shop, \$2 to \$6; blacksmiths, \$4; smiths' helpers, \$2. Indian laborers were paid \$2 a day, without board or lodgings.

The bark Hunter arrived on the 28th from St. Michael, Alaska, with ninety-five passengers and \$20,000 in gold from the Klondike.

The steamer City of Seattle, with forty empty-pocketed Klondikers, brings news from Dawson to Sept. 12th. They say that W. Ogilvie, the new Yukon Commissioner, has disappointed the miners by not removing the royalty and turning out Gold Commissioner Fawcett.

At Dawson deaths from fever are from five to ten per day, and the disease seems to be on the increase.

The steamship Bertha arrived on the 28th from St. Michael with thirty-seven passengers and about \$500,000 in gold, fourteen boxes of which belonged to the Alaska Commercial Co.

ARIZONA.

About December the water will be turned on gravel beds and bars of the Colorado river in Mohave county by the Temple Bar M. Co. The operations contemplated are among the most extensive in the placer fields of Arizona.

At Mineral Park, Mohave county, in the Dewey mine a rich chute has been struck. The Lone Star is turning out shipping and concentrating ore. The Buckeye, Katy and Report properties are being extensively developed and showing well.—The Cherry Creek

G. M. Co. of Yavapai county is reducing the ores of the Etta mine with a 10-stamp mill. The vein produces ore ranging from \$15 to \$40 per ton, most of it free milling. The last carload of ore from the Blackfoot mine, in Mohave county, averaged 204 ounces in silver per ton, seven per cent copper and several ounces gold.

In 1894 the output of the Arizona copper mines was 44,531,108 pounds, and in 1897 the total output was 51,019,222 pounds. Following is the product of Arizona mines in pounds for 1896 and 1897:

| | 1896. | 1897. |
|-------------------|------------|------------|
| Arizona..... | 13,012,000 | 13,727,912 |
| Copper Queen..... | 23,298,150 | 23,999,473 |
| Commercial..... | 46,040 | |
| Detroit..... | 7,016,348 | 8,440,138 |
| Old Dominion..... | 5,450,000 | 2,000,000 |
| United Verde..... | 22,327,350 | 31,355,025 |
| United Globe..... | 2,021,505 | 1,241,975 |
| Other mines..... | 345,288 | 200,000 |
| Totals..... | 73,745,321 | 81,019,222 |

The Little Jessie mine at Chaparral is reported sold to an English syndicate for \$50,000. They will increase the force in the mine and erect a 200-ton cyanide plant.

The Tombstone *Epitaph* says that the Wolf-ran mines in the Dragons, recently sold by Moore & Co. to Stein & Boericke, comprise twenty-four mines and the price paid was \$34,500. The value of the ore ranges from \$200 to \$500 per ton. Twenty-three tons shipped by the discoverers netted the former figure.

CALIFORNIA.

Amador.

Dispatch: The Ivanhoe—formerly Wheeler—mine near Plymouth, which has been worked for years by S. C. Wheeler & Sons and has yielded a fair income, has been bonded to J. A. Brent, Gill S. Peyton and C. McCornick of Salt Lake. These men have completed the addition of fifteen stamps to the mill, making twenty stamps in all. The stamps weigh 950 pounds each, and are calculated to crush about seventy-five tons of rock every twenty-four hours. J. A. Brent is Supt.—At the Anita, Jackson, sinking progresses. A station will be cut at once at the 700 level.—Rock from the Oneida mine is being crushed at the Zeila mill.—Repairing and sinking of the old shaft is in progress at the Zeila.—The Argonaut mine is running full as usual.

Butte.

At the Huse mine near Bidwell Bar the arrastra is nearing completion, and crushing ore will begin soon. The dredger near Oroville is working steadily and the result is said to be of an encouraging nature.

Calaveras.

At the Gwin mine, Mokelumne Hill, twenty of the forty stamps are dropping. Steam power has been introduced.—The Favorite quartz mine has been bonded to W. C. Fitzsimmons of New York and E. H. Davidson of New Mexico. Work will begin without delay.—The Coralie quartz mine has been bonded to a Chicago company represented by E. A. Converse. Development work will begin immediately, and as soon as sufficient ore is blocked out a small mill will be erected.—At the Fellowcraft the mill is crushing ore remaining in the bin, and work has begun in the shaft, it having been unwatered.—The Empress, Bullion, Tip Top, La Palomita, Mountain View quartz mines and the Bullion millsite, in West Point Mining district, have been conveyed by P. Shuman, et al, to the Paragon Con. G. M. Co. for \$500,000 value in stocks of the last named company.—The Nellie mine near Argus has installed new machinery and started a shaft, which is down 60 feet. The mine is owned by a Stockton company.—Cleaning out the Lightner mine from the water and debris that flowed into the works from the Potter mine is being pushed. The mine was considerably damaged by the gouge slide, but the management thinks it will be in running shape before the rains set in.

Del Norte.

D. Seyov of Smith River has a quartz ledge on Big Flat sufficiently rich to occasion taking up several claims in that vicinity.

El Dorado.

(Special Correspondence).—Work has resumed on the Baltic mine, twenty-five miles east of Placerville, by an Oakland company. The property was opened by men from Santa Cruz and Salinas, but with insufficient capital to push the work. It has been idle about two years.

The Chili Bar slate quarry has been bonded to J. Hardy, who is in London organizing a company for the extensive operation of the property. He writes encouragingly of his efforts.

Before my next letter it is probable that a sale of the Blue Gorge property, comprising fourteen claims, will be made. The examination of the property and the numerous ore tests have proven satisfactory to the intending purchasers. The ore bodies are large but quite low grade.

Work has begun on a third slate quarry by W. Cummings & Son within a mile of Placerville.

The Gentle Zephyr group at Volcanville, recently bonded by R. S. Raw, has been taken up by San Francisco capitalists and active work begins for their development without delay.

Work on the Crawford electric power plant is moving apace with the business energy of its promoters. The new mill on the Griffith Con. at Diamond Springs is nearing completion. A large amount of high-grade ore is ready for crushing. Diamond Springs, Sept. 27, '98.

At their annual meeting at Placerville last Saturday, the El Dorado County Miners' Association elected Thos. Clark, Pres.; D. H. Jackson, Vice-Pres.; C. H. Weatherwax, Sec.; M. Q. Meehan, Treas.

Work is progressing at the Mt. Pleasant mine, Grizzly Flat. The water is out of the

three shafts to the 600 level.—R. Claiborn found a chute of rock in his mine and is crushing some of the ore, which is turning out well.

Fresno.

(Special Correspondence).—To dispel the idea that the river beds of California have long since been worked out, and that the old streams no longer hold sufficient of the golden treasure to encourage further search, a trip along the San Joaquin river, among other streams of the State, is convincing that gold can be found nearer home than far-away Klondike.

Near the town of Pollasky the Donahue Co. has for some time been prospecting in the river, taking advantage of the dry season and the consequent easy method of studying the deposits. The company is building a dredger, with which work will be carried on upon a larger scale than has been seen upon the San Joaquin in a long time. The royalty to be paid by the operators to the owners of the land adjacent to the river is 10 per cent on the gross output.

In addition to this work numbers of smaller outfits are wingdraming the stream, and all along a scene rather unusual is presented amid the ranching outfits of old San Joaquin county.

As in many other sections of the State, so here the ubiquitous Chinaman has found an abiding place. A company of Mongols has built a dam 250 feet long and put in a flume 350 feet long and about 20 feet wide. They are working a bar 4 feet deep and 350 by 250 feet in extent. The plant is well equipped with the requisite machinery, wheel and pumps, and when the autumn rains swell the river these men, with the success usually attending their race, would surprise the ordinary individual with their gold output, were they not so characteristically silent upon the subject. It need not be alluded to here that probably the most successful small gravel miner in California, or perhaps in the world, is the Chinaman. This company will pay the riparian owner 25 per cent on the gross product.

At another place on the river a company has built a dam of fair proportions to work out a pothole 60 feet wide and 600 feet long. This they expect to empty of 20 feet of water with a centrifugal pump. The people operating this are known as the Ohio Co.

To work another stretch of potholes and pools the Higgins Co. has built flumes and dams and put in costly pumping machinery.

Two additional companies are all prepared to work the river deposits, or will be within thirty days—the Sullivan and the Deegan & Hollenbeck, who likewise have expended much money and labor in outfitting for their operations.

Pollasky, Sept. 25th, '98.

Kern.

Randsburg Miner: The Mayflower, Randsburg, is outputting good ore. It is owned by Brown & Delameter.—The Red Dog mill cleaned up \$8000 worth of bullion last week from a run of 100 tons of ore from the Butte mine.—The Rademacher mine near Randsburg is making a good showing. The shaft is 200 feet deep with drifts each way. It is sunk in the ore vein and neither hanging nor foot wall has been discovered. The ore varies from \$15 to \$75.—The Dean quartz mill has been moved from Oro Grande to the Slate range and they expect to start October 15th on the Hogan mine. From this mine 100 tons plated \$33 a ton. The shaft on the mine is 150 feet deep, with drifts in ore which runs from 2 to 13 feet in thickness.—The Wedge mine has struck rich vein at a depth of 350 feet in the west drift that mills \$200 per ton.—In the Buckboard mine the ledge is wide, running \$5 or \$6 all through, with streaks of rich ore up to \$100 per ton. The shaft is down 125 feet with drifts on both sides.—Harrison & Llewellyn have taken a bond on the Radcliffe mine in Pleasant canyon for sixty days and paid \$2000 down. They have begun work.—To the Barstow mill the Wedge people have shipped a carload of ore and the Little Butte 100 tons as a test, and the Big Butte will send a lot. This camp can keep the Barstow mill running on low-grade ores alone.—J. James has sunk a shaft at the junction of the Treasure and Nellie M. mines, and has a vein 5 feet thick, 2 feet of which is good and the balance will all burn a little.—At the Meredith mine in the Slate range they have a pipe line three miles long. Some ore shipped to Selby returned \$215 per ton, and altogether they have taken out over \$25,000.

Review: Supt. Meade will put in a fifty-ton cyanide plant at the Long Tom mine near Bakersfield.—The Johannesburg Reduction Works made a 100-ton run for the Big Butte.—The Esperanza mine near Garlock is opened by a 260-foot tunnel, on ore all the way; there is 3 feet of it that averages \$17.60 to the ton.—The Yellow Aster Co. is shipping seventy-five tons of ore per day to Barstow. Their product last month was one of the largest in the history of the company. At the wells the 113,000-gallon tank has been completed and the work of filling it with water has begun. Work on the pipe line is progressing and will be finished the middle of November.

Mariposa.

(Special Correspondence).—Work is to be resumed on the Lost Friend mine at Horse Shoe Bend. A new shaft is to be sunk 200 feet and some drifting done. There is a vein of 2 feet of \$15 ore in the bottom of the present 60-foot shaft. The Keystone Co. made the first cleanup in its 2-stamp mill on the Porter property last week, with results said to be highly satisfactory. The Merced Co. started the stamps in its 40-stamp mill on the 27th after nearly a year of idleness. A new 10-ton locomotive has superseded mules on the ore tramway, but its weight necessitates entire reconstruction of the track. The Penon Blanco properties have been

under examination the past week and there are rumors of extensive operations later. Mariposa, Sept. 28th, '98.

The report of the directors of the Merced G. M. Co. is as follows:

| | |
|---------------------|-------------|
| Capital stock..... | \$1,500,000 |
| Amount paid in..... | 1,200,000 |
| For property..... | 333,330 |
| Cash..... | 866,670 |
| Indebtedness..... | 67,325 |

Mono.

The Lundy cyanide plant at Lundy is running full capacity; L. Bell is Mgr.

Nevada.

(Special Correspondence).—Since the discovery by McKnight of gold quartz on Gold Mountain, afterwards Gold Hill, in the fall of 1850, Grass Valley has maintained a prominent place in the records of great California gold mines that from their incipency, in the early fifties, have paid from the verdant sod to thousands of feet beyond, and are to-day yielding handsome profits.

The Omaha mine of the Omaha Con. group was located in '65. A few years thereafter active operations began under the management of Geo. Norton and the present Omaha shaft was sunk 200 feet along the vein and lateral drifts run, from which very rich ore was extracted. M. Dodswoth succeeded Mr. Norton in '76 and continued work until the shaft was sunk to the No. 10 level. Lateral drifts were extended opening up the Omaha No. 2 chute. It was found, after considerable exploratory work, that the Omaha No. 2 chute passed southward into the Lone Jack mine. Both companies were now in a quandary. They did not know whether to buy, sell or consolidate. The Lone Jack Co. could not work without the Omaha on account of the excessive inflow of water, and consequently both closed down without agreeing. In '85 both parties got together and a consolidation was reached, and the present Omaha Con. G. M. Co. organized. Geo. Mainhart, one of M. Dodswoth's trusted bosses in the early working of the mine, was made superintendent, and has since held that position. Under his management the company has sunk the shaft to the 1500 level and the Lone Jack to the 1700 level. Two years ago they bought the Homeward Bound property, adjoining the Lone Jack on the south, and have put down a shaft which is now approaching the 1800-foot level; it has a good-sized ledge of fair to good ore. All shafts on the property are connected with drifts from the various levels. The company's 28-stamp mill is kept running day and night. The ore is trammed in ton cars from the new shaft to the mill, one-half mile distant. Sixty men are employed. The motive power at the Omaha Works has been water and steam, but the company is now installing electric power. An "S. K. C." type of synchronous motor of 120 K. W. capacity will drive a 90 K. W. direct current machine, which in turn will generate power for the direct connected motors of the hoist and pump. When this is completed, the Omaha will have a fine electric plant and will be the first mine in northern California to apply electric power direct to a hoist. The power will be furnished by the Nevada County Electric Power Co.

One-half mile south of Grass Valley, on the easterly side of Wolf creek, lies the Granite Hill mine. This, though worked for years, has attained a depth of but 600 feet, due to limited assessments, but it has proved profitable. The company, the majority of whom are Sacramentans, are at present driving the drifts on the 600-foot level and have a good showing of ore. The motive power is water, which runs a 10-inch Pohl pump and a 6-inch lift pump, a hoist and a mill of five stamps and concentrator. The mine is under the superintendency of T. E. Phillips.

The Massachusetts Hill is increasing its power-house to twofold its present extent, and when the new air compressor machinery is in place, as also the large electric generator, this company will undoubtedly have one of the largest as well as one of the best equipped mining power plants in California. The Massachusetts Hill mine has made a great record for the depth attained. The ore is taken from the bins at the mine in large wagons pulled by a heavy traction engine to the North Star mill, where it is reduced. The mine is under the efficient management of T. D. Foote.

At the Golden Treasure mine work is being vigorously prosecuted. Five distinct veins are known to cross this property, undoubtedly extensions of the W. Y. O. D., Pennsylvania, Diamond and Bullion mines. The general strike of the veins is north and south with a westerly dip. On the North extremity of the claim, near the W. Y. O. D., between two of the veins, was sunk some years ago a vertical, two-compartment shaft, which attained a depth of 180 feet. The company then developing the claim, through some financial hitch, ceased operations. The present company—of which C. P. Gray is Pres., Edw. Dudaud Vice-Pres., Fred Franks Sec'y and First National Bank Treas., all of San Francisco—several months ago unwatred the mine and prosecuted developments to cut the ledge. A few months ago the ledge was cut and drifts have since been run upon it north and south from both crosscuts, and to-day the showing in the drifts from the east crosscut is of such a nature that the company has decided to raise from the south drift to the surface and put down an inclined shaft and sink 500 feet. These two veins will come together, provided they maintain their present pitch, before this depth is attained, and form a stable pay chute. The mine is under the superintendency of J. E. Stearns, who was secretary of the Mines and Mining Committee of the World's Fair, and for twenty-five years past has been connected with mining in Colorado, New Mexico and Idaho. Grass Valley, Sept. 27th, '98.

It is locally reported that the river mining claim near French Corral is turning out big. The company has built a flume which turns the 16,000 inches of water in the river. Good

gravel has been found.—The Franklin mine near Nevada City, idle twelve years and which produced good ore, is to be operated again by Caldwell & Hussey, who have begun work. The old shaft is down 200 feet.—Work has been temporarily suspended at the Milliken gravel mine near Nevada City. A survey is being made.—Twenty cars of ore were shipped via Wheatland from the Spenceville mines to Stege.—Morgan & Co. are running a tunnel on a fair-sized ledge of good quartz at Lake Faucherie.

A Pelton wheel for the Central shaft has arrived at Grass Valley that is 32 feet in diameter and is the largest Pelton wheel on the coast.—The new 5-stamp mill for the Golden Gate mine is being put up and will soon be crushing ore.

Development at the Lecompton mine near Nevada city continues with encouraging results.

Herald: The Texas M. Co. will build a 20-stamp quartz mill, ten to be completed this fall and the rest to be added next spring. It is to be run by water power. Some 2000 feet of 15-inch pipe is being laid to bring in water. An air compressor will run the power drills.

Placer.

(Special Correspondence).—G. W. Gagan and Julius Holm are erecting a 5-stamp mill upon the Jim Dandy mine at Blue Canyon, Placer Co. Rock has been struck which goes over \$22 per ton. After following up the leads running east and west from the main ledge they felt justified in placing machinery upon the property, which is located down in steep ravine of over 2400 feet. So precipitous is the canyon that all the equipment had to be put upon sleds and skated down. The ore body is of a kidney formation and some of it runs as high as \$80 per ton while the sulphurets assay \$180. A. J. Russell late of the famous Leary mine of Butte, Montana, is to be in charge of the property.

Towle, Sept. 29th, '98.

The bond on the Oro mine, near Iowa Hill, has been extended until Aug. 1, 1899, and development work will continue. E. M. Armstrong will remain as Supt. The company is composed of Woodland, Colusa and Red Bluff people.

The August statement of the Pioneer G. M. Co. makes the following comparisons:

| | 1898. | 1897. |
|------------------------|---------|----------|
| Tons rock crushed..... | 536 | 765 |
| Value gold bars..... | \$5,982 | \$14,543 |
| Expenses..... | 5,459 | 6,090 |

Net.....\$ 503 \$ 8,453

Colfax Sentinel: The Hidden Treasure Gravel M. Co. at Sunny South and Centerville employs 230 men. The power to operate the mine is generated by a \$25,000 electric plant. The water from the mine tunnel at Sunny South, a flow of about 40 inches, is used to furnish pressure to operate the machinery at the power plant. The trainloads of gravel, the blower, saws for framing timbers, and other machinery, are operated by electric power. The present force is able to mine an average of 400 cars of gravel per day with two shifts. The mine is lighted by electricity, and the residences at Centerville are being wired for electric lights. The Dam tunnel is now in 7800. The crosscut shows a width of channel of 1000 feet. At the close of one of the driest seasons ever known in California the flow of water from the Hidden Treasure tunnel continues almost the same as former seasons.—At the Eureka mine near Centerville work on the new upraise is progressing in a satisfactory manner. Supt. Chappell has ten men on the roll. The new upraise, started from the 2500-foot mark in the main tunnel, is now up 78 feet. This is one of the most extensive properties on the divide.—At the Paragon gravel mine at Bath twenty-four men are working. A lead of good gravel has been struck and the mill is running every day. W. H. Grennell is Supt.—At the Basin Con. mine near Deadwood gravel is being breasted one-half mile in on the tunnel. Water for washing gravel on the dump is scarce. Nine men are employed, and J. Dunlap is Supt.—At the Buckeye placer mine in Brushy mining district, owned by J. A. Johnston and Mrs. J. V. Collins, the main tunnel is in over 1000 feet. Blue gravel has been struck from an incline. Nuggets worth as high as \$2.25 have been secured, and the future for this mine looks promising.—Lofruth & Co. are working their Elkhorn gravel mine near Deadwood and take out about ten cars of gravel per day.—Some rich quartz is being taken out of the Rawhide mine on Texas ridge. The property is owned by J. T. Patrick & Co.—Supt. Rodger of the Cedar Creek mine at Shady Run is getting the property in shape for winter. He expects to start up with twenty men.

Gagan & Holm are erecting a 5-stamp mill on the quartz ledge owned by Laveau and others, near Shady Run. Holm is interested in several mining industries throughout the State. He is operating the black-sand plant near Crescent City with satisfactory results.

Plumas.

A discovery of "natural coke" has been made in Genessee valley. Prospectors found a vein 15 feet thick of coal formation. The same formation was again tapped at a distance of a mile. T. Price & Sons, who were given some of the pieces for examination, say the samples had been subjected to heat at some previous period, converting it into natural coke, and that the article is of commercial value. A test of 1000 pounds in the Greenville foundry showed its heating qualities to be but four minutes short of the best Eastern coal.

Sacramento.

Telegraph: Cobb & Kinney are prospecting with a view to purchase the Mississippi Bar gravel mines near Folsom. If the results are satisfactory, they will build a dredger of 2000 cubic yards capacity per day. The cost of the dredger will be about \$30,000, and it will be

similar to the one now in use on the Feather river.

San Diego.

Union: About ten men are working in the Bay Horse mine of Mesquite district, which has been sold to a company of Eastern capitalists. The deepest shaft of the Bay Horse is down 165 feet and is in low-grade ore, in which pockets of rich rock are sometimes found. It is the intention of the company to run a 6-inch pipe line from the Colorado river, a distance of twenty miles, for the operation of a 20-stamp mill, which will be erected this fall, and as soon as practicable increase to forty stamps or more.—The Irma, another property belonging to the Bay Horse Co., is being gradually developed and is displaying some good ore. Other promising properties of Mesquite district have been partially developed, but are idle for want of water. With the coming of that there will come a general revival.

Shasta.

(Special Correspondence).—The stability of the Mountain Copper Co. in the mining industry of this county becomes more evident as time progresses. The residences built for the officers of the company and the neat cottages erected for the families of many of their employees form a village, which is pleasantly located on the hill overlooking the smelter plant. The company, in addition to its large boarding house and lodging apartments, will erect still larger accommodations, as is shown by an order placed with the lumber company at Buena Vista for 1500 M. feet of lumber. The additional accommodations will enable the company to employ about 300 more men, bringing their total upwards of 800 laborers.

I am informed that the clearing of ground now going on is for the erection of several additional smelters. The company has recently built and furnished a general merchandise store which would compare favorably with those of larger towns.

The company's hospital is a model of neatness and is by no means a small affair. The company employs a physician, who gives his services exclusively to the employees.

I am told that for the time being it is not intended to change from the system of shipping to the refinery in New Jersey. However, there is a probability that contracts may be made for furnishing the Orient with its product; in that event, as in other trade relations consequent upon recent international occurrences, San Francisco becoming the head of commerce for the United States, the company is prepared to erect in this section a copper refinery equal to if not larger than any like plant in operation to-day.

The acquisition of the large amount of territory to which reference was made in my letter two weeks ago, and the large amount of development and costly machinery put upon it, together with the projected extension of the company's railroad to the new property, are additional evidence of the permanency of the industry. This new purchase lies about a mile N. E. of Copper mountain. An erroneous idea exists with many in reference to the contiguity of the smelter and the mine. The latter is about seven miles above the smelter plant, and is connected by a circuitous route of standard gauge railway, thirteen miles long, to the top of the mountain. Here again is a distinct camp, with its offices, store, boarding and rooming houses, accommodating from 400 to 500 men. These, in conjunction with the newly acquired property and the smelter at Keswick, show somewhat the magnitude of the Mountain Copper Co.'s holdings. Redding, Sept. 26th, '98.

D. B. Hunt, managing owner of the Milkmaid mine near French Gulch, has closed the mine because the pay shoot could not be found in the lower level. The company will lease ground on the several claims to miners.—R. E. Hanley, Supt. of the Niagara mine near French Gulch, is interested with J. L. Cannon in a quartz property on Tom Neal creek. They have put six miners at work to further develop the property.

Free Press: At Harrison Gulch in the neighborhood of 200 men are employed in the Midas Co.'s mine and ditch.—Capt. Roberts is considering the displacement of the cyanide plant by a roasting process. Several dozen men working on the former were laid off a few days ago, and nothing further will be done until the plans for the future are decided.—A new quartz mill is en route from San Francisco for the Washington mine at French Gulch.

Sierra.

The Blue Ribbon, Oakland and Young California mines near Downieville report good progress.—At La Porte J. C. Thomas has men cleaning out the ditch to convey water to Spanish Flat. It will be put in repair as far as Yankee Hill for mining purposes.—Work at the Claybank mine is being pushed ahead and it is hoped they will reach the channel.—The La Porte Con. M. Co. have completed their ditch repairs and are ready for work when water comes.

Siskiyou.

The Aromas M. Co. has deeded all its property in the Salmon country to the Pajaro Valley Bank.

A claim strike is claimed to have been made in the Siskiyou mountains, on Sterling butte, by Angle & Brown. They claim to have fifty pounds of gold dust. The mine is said to be 7200 feet above the sea level.

On Cherry creek Wadsworth & Ironsides have struck a ledge as wide as the tunnel. It carries good quartz.

Journal: S. Barton has begun hoisting pay gravel on his river claim at Oak Bar.—Jillson & Co. are taking out good quartz from their ledge at Cottonwood.—The Greenhorn Blue Gravel M. Co. at Eureka contemplate putting in an electric plant to run the pumps and hoisting machinery. Boiler and engines arrived from San Francisco this week.

Sonoma.

The Great Eastern quicksilver mines at Guerneville have forty men on the payroll.

During August 140 flasks of quicksilver were shipped to San Francisco; the output for September will be 160 flasks.

San Bernardino.

There are four stamp mills at Dale crushing the quartz.

Tuolumne.

(Special Correspondence).—The Norwegian mine, at Tuttle town, that has had a checkered career since the early 50's, and which has been taken up within the past two years by San Francisco capitalists, is giving substantial proof of its values. Owned originally by M. Lawson, it had been worked in a desultory manner since 1851 and produced something over \$80,000. The property, comprising three claims, was secured by the present company a little more than a year ago. They procured a patent, equipped the mine with an air compressor, power drills and a prospect mill, then began sinking. They took out their first gold Jan. 17, 1897. That same year they took out \$51,000. After getting to some depth they struck a horse, which they have since cut, and last week found a chimney at a depth of 350 feet, 20 feet long and 6 inches thick, that is extraordinarily rich. The writer saw a gold pan almost filled with a product that had been run through the crusher and came out almost solid gold. Along with the gold-bearing quartz tellurium appears occasionally, and high grade sulphurets are shown in fair percentage.

Tuttle town, Sept. 27th, '98.

In sinking for a sump Fraser & Dorsey recently uncovered a pocket of several hundred dollars in their mine at Jackass Hill.—In the Confidence mine a winze from the 810-foot level, the lowest in the mine, is to be carried to a depth of 300 feet in new ground.—At the Dreisam mine sinking a winze on a 2-foot vein of \$100 rock goes on. The mill is operating three stamps out of the twenty-four, the water used being pumped from the mine.

On the Great Eastern mine, on the east belt, considerable work has been done without success until recently. A ledge was found 15 feet wide. Some 350 feet of drifts on the ledge have been run. A large amount of ore was extracted which is said to assay \$10 to \$30 per ton in free gold.

Democrat: The Great Eastern mine, on the East Belt, owned by Restano Bros., is being operated under a bond by an Eastern Co. In past years the Great Eastern was worked at various points. The present company run a tunnel 100 feet and tapped a vein 15 feet wide. The drift is 350 feet on the ledge. A large amount of ore is on the dumps. Assays give returns of \$10 to \$30 per ton gold, and a fair percentage of sulphurets worth \$200 per ton. The work of development will go on until next summer, when a mill, either twenty or thirty stamps, is to be put up and the property otherwise equipped.—At the Golden Eagle, near Sonora, the vein averages from 12 to 24 inches wide, and milling tests give returns of \$31 per ton in free gold. The quartz also carries sulphurets.—A winze is being driven on the Hope at the 260-foot station. The vein is 14 inches wide and carries good ore.

Yuba.

(Special Correspondence).—In the Pennsylvania mine at Brown's Valley unwatering the shaft has been completed. The ledge, which was found by F. W. Page previous to the recent closing of the property, is being followed, and it proves to be from 8 to 12 feet wide, and the ore runs from \$7 a ton upwards. J. Hibbert is Supt.

Brown's Valley, Sept. 26th, '98.

COLORADO.

BOULDER COUNTY.

Denver Mining Record: The sale of the Kekionga mine and Delano Co.'s chlorination plant at Boulder, by the first cash payment of \$30,000, marks the beginning of a new era of mining and milling in that county. The property will be managed by T. A. Rickard for the Ventura M. Co., who made the purchase.—The Kilton Reduction Co. at Boulder has bought 100 per cent more ore during the past six months than during the same period last year.—Ore shipments over the Colorado & Northwestern from Boulder the past week have averaged five cars a day.—Five hundred pounds of tellurium ore were brought from the Rip Van Dam mine at Springdale, some of which runs \$20 a pound. The Rip Van Dam has fifteen men at work; the shaft is 140 feet and the tunnel 550. The mine is equipped with air compressors, and in a few weeks an electric light plant will be put in.—At the Forest mine twenty-three tons a week is the output and each ton averages about \$80 in silver.

After a series of tests, a chlorination mill for the treatment of the ore around Eldora, with a 50-ton daily capacity, will be built at a cost of \$60,000, and so arranged as to be automatic from the time the ore goes in at the top until the tailings are drawn.

CHAFFEE COUNTY.

At Whitehorn the building for the concentrate mill is about completed and the office is well under way. The mill is expected to be running early next month. Another concentrate mill will be erected on the Calumet branch of the D. & R. G. railroad, costing \$15,000. They claim that fully 90 per cent of the values can be saved.—In the Turret district Chicago capital has bought for cash the Vivandier and Golden Wonder and taken a \$30,000 bond and lease on the Jasper.

The Mary Murphy mine and mill at Romley are in operation. The mill handles 100 tons of ore in twenty-four hours.—At Whitehorn, O. W. Crawford et al bought the Independence mine, on which they took a ninety-day lease, and began removing 50 feet of water from the shaft. A large force will be put on as soon as the shaft is clear and the ore will be shipped from the 6-foot ore body that runs \$20 and better in gold. The low grade ore will be treated by the home mill and the high grade shipped.—The Sedalia in the Poncha district is one of the big copper producers and shippers of the State; another rich find is re-

ported which shows rich copper and also carries \$300 in gold per ton.

CLEAR CREEK COUNTY.

Ore running 2000 ounces in silver and a little gold is found in the Glance and Ruby mines in the Daily mining district.

The Gold Coin people, operating at Idaho Springs, say that the Freeland group is the best paying property under their control. They are working in this and the Toledo and have been fortunate in opening into ore bodies. The Freeland adit was driven for over 2000 feet, and for most of the distance some mineral was cut. For many years it was neglected until recently, when retimbering and cleaning out was begun. It has resulted in reaching the ore streak, and, in upraising, the first-class ore has increased in width from a few inches to 20. All of this is smelting ore and ranges from \$60 to \$120 per ton.

DOLORES COUNTY.

From Rico were shipped the third week of September fourteen carloads of ore. From January to September were shipped 566 carloads—an increase over the same period of 1897 of 222 cars.

EL PASO COUNTY.

The Gold Cross M. & M. Co., near Woodland Park, has a 60-ton milling plant on the ground and it will be completed in fifty days. The ores of this section have been treated in both large and small quantities by every known process, and it has been demonstrated that cyanide is the proper treatment.—The Frisco G. M. Co.'s mill, near Woodland Park, with a daily capacity of fifty tons, has begun work.

At Victor, notwithstanding that work was suspended in the Gold Coin for one day, the week's output amounted to 720 tons of ore. The highest tonnage for any one day was 140 and the lowest 115 tons.—The shipments for August from the Hull City placer yielded a gross value of \$103,855.73, upon which the company receives a royalty of \$30,123.55.—The Denver Republican says that beginning with 1891 the Cripple Creek district produced to September 1st of this year over \$47,000,000 in gold, while for 1896 alone up to September 1st the production was almost \$10,000,000, and it is estimated that the total production for this year will be at least \$15,000,000. The August product was almost \$1,500,000, and it seems more than probable that the four months succeeding will average fully as large. Total dividends to September 1st were almost \$6,500,000, and of this amount the first eight months of 1896 supplied \$1,636,535, more than one-half of all the dividends declared prior to 1897, and that the total dividends for 1898 will probably exceed \$2,600,000.—A quarter interest in the Dillon, a non-producing Battle mountain property, was sold last week to J. M. Day of Illinois for \$25,000.—Of the Vindicator leases the Holman is producing fifty tons per week and Whiteside and Stark seventy-five tons. The ore runs from \$30 to \$80 per ton.—The various lessees operating the Free Coinage group are making money for themselves and the company. The output of the Pinto is eighty tons a week, worth \$40.

The August report of the Independence T. & M. Co. shows the net output was \$80,975.63 and the royalties \$20,123.55. The total net receipts since Feb. 1, 1898, were \$312,746. The ore chute is 650 feet long. The high grade runs from \$240 to \$320 per ton. There are twelve shafts on the property.

GILPIN COUNTY.

The East Notaway mine near Central City shipped ore early in September running over fifty ounces gold, or \$1066 per ton. Ore taken out last week, a sack lot of which was sent to the State ore sampling works, gave 344 ounces gold, or a commercial value of nearly \$7000 per ton. The lessees shipped another three and a half tons of this ore. Nearly four tons of ore were shipped which ran twenty-two ounces gold per ton, or about \$400.

In Apex a third interest in the Geiger mine was sold last week for \$215,000 cash. Hundreds of tons of ore are blocked out in the mine and heavy shipments are made daily to Black Hawk. The owners are planning the erection of a smelter close to their mine.

HINSDALE COUNTY.

(Special Correspondence).—The Ute and Ulay mill is handling 150 tons of ore per day from the mine of that name. The product is a concentrate containing about 60 per cent lead and 15 ounces to 18 ounces silver and small values in gold. The mill contains crushers, rolls, vanners and round tables. Hampson & Palmer have just put in a plant of canvas tables and distributors to handle the tailings from this mill. They can handle about seventy-five tons per day of the slimes. The Ute and Ulay mine and mill employ about ninety men under the superintendence of M. A. Nicholson.

The Hidden Treasure mine and mill, under the management of E. C. Dewey, are running regularly and have excellent equipment, as has been heretofore noted.

E. C. Wager, of Lake City, is developing the Copper Coin up Henson creek, which has a remarkable showing of native copper in place.

The St. Jacobs mine, at Carson, belonging to Pittsburg parties, resumed work this year after several years of idleness. It is a producer of silver and copper and employs about twenty-five men.

The Golden Fleece, which has long been the great producer of tellurium ore in this county, contemplates the driving of a 3000-foot tunnel from a point near the shore of Lake San Cristoval, which will cut the vein 1000 feet below the present lowest workings. The plans of this management also contemplate the building of a mill to handle the lower grade ore which the mine is said to possess in abundance.

The topic of paramount interest at this place now is the proposition to open the Lake Fork of the Gunnison river for power and milling purposes. This stream is the outlet of the

beautiful Lake San Christoval and flows through the town of Lake City. The only obstruction to the proposition is that the city has a water supply plant on the upper course of the stream. To open the stream for milling would foul the water for domestic use and make it necessary for the city to secure its water supply elsewhere. It is believed this may be done and that the way may be opened for making this a milling center.

WASCOTT.

Lake City, Colo., Sept. 24th, 1898.

LAKE COUNTY.

The Mab mine, Leadville, is outputting 140 tons daily. The output for September will reach 3500 tons.

At Leadville the output for September will be fully 50,000 tons of all kinds of ore.

SAN JUAN COUNTY.

The daily output from the Tiger mine at Silverton aggregates in first and second class about twenty-six tons. The heavy sulphides are shipped to the smelters and the quartz put through the mill. The Sunnyside mine last week produced over 100 ounces of gold in a single retort, the season's product from amalgamation alone. The weekly output of first class ore from the Congress mine is from ten to twelve carloads. The mineral runs high in copper and silver. The dump is being sorted and about twelve to sixteen tons of second class hauled therefrom daily to Ouray. The mine is being worked on lease, the force consisting of twenty-eight men.

SAN MIGUEL COUNTY.

The Carribeau mine near Ophir shipped seven cars of high-grade concentrates. The product is steady and regular. The Suffolk mill is dropping thirty stamps on custom ore furnished by various leasers, and valuable reports are turned out. The Shoemaker output keeps ten stamps busy, while the product from Suffolk properties taxes the capacity of the remaining thirty stamps. Small lots from other properties on Silver mountain are being treated, some of it returning an average of \$50 to the ton.

Last week's ore shipments from Ophir were seventeen cars. The shipments for the year aggregate 508 cars.

SAGUACHE COUNTY.

The Nelson tunnel at Creede has reached a depth of 6000 feet and is almost completed. The tunnel drains twelve of the largest properties in the camp, but will also be used for transportation purposes.

IDAHO.

At Elk City two large hydraulic companies are washing out considerable gold. One is the American Hill Co. and the other is the Buffalo Hill Co.

The Bruiser mine, at Centerville, is reported sold to Woodburn & Anderson for \$10,000. The vein is $\frac{3}{4}$ feet wide and averages \$20 a ton in gold. The new owners expect to mill twelve tons a day. The Lorraine mine, operated by Pettis & Co., has opened up 27 feet of ore averaging \$7 a ton. In the Joy & Hobson property 6 feet of ore has been developed that carries \$22 a ton.

At Gem the new ore bins for the Black Bear mine are nearing completion, and the mine will soon be in shape to ship ore as it is taken out. The flume is being repaired, and it is possible that the mill will be run some, if the fall rains cause enough rise in the creek to furnish power.

The Salubria Citizen says that the Bay City mines have cleaned up three times this season, and from the first a run of ten days netted \$274; second, \$1000; and third, \$1200.

The Ketchum *Keystone* learns from reliable authority that the Copper Basin mines have been sold to a Canadian company and that men will be put to work on the property this fall.

W. A. Wilson, in the employ of Thos. Kearns of Utah, is examining a gold property near Hailey. There were twelve tons of ore shipped from the property that netted \$100 per ton. The ledge averages 2 feet in thickness and crops out for over 1200 feet.

MICHIGAN.

The Belt copper mines of Greenland, Ontonagon county, Mich., consisting of 3300 acres of mineral land, machinery, buildings and improvements thereon, were recently sold at auction, bid in by Wolsley and Mercer as trustees for the debenture holders for \$256,000.

Houghton reports that a three-ton mass of copper has been found at the bottom of No. 2 shaft of the Winona mine. The shaft is in rich ground from top to bottom.

MONTANA.

The annual statement of the Boston & Montana Con. C. & M. Co. shows: Capital stock, \$3,750,000; amount paid in, \$3,750,000, as follows: For property, \$2,500,000; by cash, \$1,250,000; amount of existing indebtedness, including bonded indebtedness secured by mortgage, \$1,245,500.76, of which sum \$747,000 represents bonded indebtedness, secured by mortgage on the corporate property.

NEVADA.

P. McKenzie who recently bought the Cooper claim on Bull Run mountain is said to be extracting ore which will grade \$300 per ton. The Dexter mine at Tuscarora is dropping fifteen stamps, is rushing the work of obtaining power from Chicken creek and will have the 40-stamp mill running in sixty days. The Young America Co. is understood to have let a contract for the erection of a mill to be completed before December 1st. The Eira is producing at the rate of three carloads of high grade ore per month besides a large tonnage of low-grade which will be treated in the old Nevada mill as soon as the repairs are finished. L. Parsons is reported to have a strike near the Dexter mill of a large ore body. J. Talbot has a property bonded and is reported to have struck pay ore. Twelve men are at work. The shipments last week over the E. & P. railroad were 374,260 pounds. J. Smith, at Pine Grove, is operating the old Wilson mine and the tailings dump from

the stamp mill that has been working for many years. In the tailings are found sufficient gold values to justify working them. A cyanide plant has been running since last spring. The shipments are productive of profits. The tonnage in the tailings dump is reported large and it is said will yield a fortune.

The Dayton *Times* says that the force of the Reno mine was increased last week, which indicates that the bullion returns from the test run at the new mill are satisfactory.

NEW MEXICO.

New Mexican: At Cooney the Copper Queen mine has suspended indefinitely. The ore is too hard to mine and of too low grade to pay.

A. E. Dawson, Supt. of the Santa Rita Copper & Iron Co., is shipping six cars of iron ore per day. He is also Mgr. of the Santa Rita copper mines for the Hearst Co., and is sending twenty tons of copper ore per day to the Silver City Reduction Works. At Mogollon the Little Fanny mine remains closed with large bodies of ore in sight. Offers of a good royalty have been made to the company, but they will neither work the mine nor lease it to be worked. The Confidence mine is working seventy miners. The main adit level is in 1700 feet, and has produced good bodies of ore nearly the entire length of the drift. The ore varies in width from 5 to 20 feet and is of good milling grade. The end of the adit has attained a depth of 550 feet. At 1200 feet from the mouth of the adit a shaft has been sunk from the surface. The mine is producing eighty tons of ore per day, which is hauled to the company's 30-stamp mill at Whitewater.

OREGON.

(Special Correspondence).—A company of merchants have opened up the Queen of the West, Gold Reef, Red Cross and Center, with the Mayflower adjoining. The first named has a ledge of good milling ore 6 feet wide. Shipments of ore to Tacoma, at an expense of \$34 per ton, returned a net profit of \$84 per ton. The mineral belt here is two miles wide; contact granite and black slate, with a pitch to the southeast. A large deposit of mottled black and white marble has been found and a sample sent to the Mining Bureau at San Francisco.

Cornucopia, Sept. 25th, 1898.

At the Black Butte Cinnabar mine in Douglas county the smelting furnace for the reduction of the ore is just finished. There are fifty men on the company's payroll.

Near Ashland fifteen men are cutting the three-mile ditch to the Poorman mine. The Shorty-Hope mill which has been shut down for several weeks on account of a shortage of water has started up again. Edwards & Evans have begun development work on the Fairview property. At Mount Reuben in Josephine county, Senator Jones of Nevada has eighty men developing a quartz ledge and on Grave creek are miles of new ditches and new hydraulic pipe to carry water for placer mines as soon as the fall rains set in.

Bement Bros.' quartz mill at Eagleton is crushing ore from an 18-inch vein. The discovery of a copper deposit is reported from Quartzburg in Grant county.

The Baker City *Democrat* says there is a probability that operations will soon be resumed at the Virginia Consolidated. Prospecting above the 300-foot level can be carried on, though the Virtue shaft is not cleared of water.

Journal: Near Grants Pass the Gold Key, operating the Braden mine, are putting in new machinery. J. J. Martin, Supt. for the Seattle M. Co., has bought seven claims in the Big Applegate district for \$5250. The S. F. people interested in the Hammersly property at Jump-off-Joe district will shortly resume work. D. Cameron has bought the Chinese property on Pleasant creek paying \$2400, and is preparing it for the winter season. J. D. Stevens has sold to Lister & Calvert his half interest in three placer claims for \$1000. The Rogue river gold dredger started last week near Tolo. They found 8 feet of gravel. The dredger is run night and day. On Upper Grave creek near Leland this winter three hydraulic plants will be in operation in addition to those already established, and every claim along the creek for a distance of six miles seems to be taken up. Caldwell & Kelman have leased the Mayflower mine in eastern Oregon and will put up a smelter of ten to fifteen tons per day capacity to be in operation next month.

UTAH.

At Park City over 1500 tons of Crescent ore is awaiting shipment, and the amount is being added to as fast as the tramway can get it down from the mine. The jiggling plant has produced about 200 tons of concentrates and good results have been obtained. The Silver King's new mill will be finished by the time bad weather sets in. The ore shipments last week were 1,752,770 pounds. At Mercer the Chloride Point made a shipment of 300 pounds of cyanides, the third shipment from the new mill. The Geyser-Marion made a shipment of cyanides of 800 pounds. The Frances group is showing up well. The vein has been reached and assays sixty-two ounces of silver. Ore has been found in all three shafts on the Omaha, and prospecting the vein by drifts is progressing. A sample from the dumps assayed \$12.80 per ton. The Daisy made a shipment of cyanides consisting of 158 pounds. This lot will bring \$6000. It represents the product of the mine for two weeks. The Mercur shipped 1000 pounds of auro-cyanides of the value of \$25,000. There has been an increase in the values of the Mercur mine tapped by the Lulu incline. When work was started in the ore body at that point values were below the average, but now they are better than in the parts of the mine already stopped. Four assays give from \$12.50 to \$14.60 per ton. The North Star of Tintic shipped three cars of ore, making 200 tons the present month. They expect to take out a carload of ore daily. The Mammoth mine at Mammoth has found

the ore in the drift off the 1700-foot level. This gives 80 feet of stoping ground, the vein above at places being as much as 14 feet wide, bearing gold and silver.

In the Treasure Hill mine near Silver City ore has been found showing 330 ounces in silver to the ton and from \$19.20 to \$5 in gold. The company has thirty-five men on its payroll, and this month has shipped twenty carloads of ore.

Shipments from Tintic last week were seventy-nine carloads of ore, fifteen of concentrates and twenty-eight bars of bullion. Operations at the Hailton & Lark at Bingham are mostly in the 800 and 850 levels, thirty-five men being employed. Since work was started last June in the 850 a drift has been run 400 feet. It is now in about 3 feet of first and second-class ore, assays from first showing 37 per cent lead, 10 per cent copper and 34 ounces silver. Stoping is progressing in both levels. Three cars of crude were shipped last week and there are several more in the bins, besides eight or ten of concentrates.

WASHINGTON.

Near Meyers Falls the Vulcan M. Co. has begun work on a 200-foot tunnel. Work has resumed on the Silver Queen. A large amount of development has been done on the property and considerable ore taken out. The Acme is the most extensively worked property in that vicinity. A large body of ore has been found and shipments will soon commence. At Northport the smelter has blown in. A daily shipment from the Le Roi mine is coming to the smelter of 400 tons. Roast heaps containing from 2500 to 3500 tons of ore are burning.

At Republic a new pulverizer is being placed in the Republic mill; with a daily capacity of fifty tons, the mill is turning out bullion at the rate of \$1000 per day. At Colville the men employed at the Old Dominion mine have finished clearing out and timbering the 4000 feet of tunnels in the property.

At Republic the control of the Iron Monitor claim is said to have been sold for \$12,000.

WYOMING.

At Grand Encampment a discovery has been made in the Haskins property, in running their prospect tunnel, of an ore vein 5 feet in width that yields 40 per cent copper.

Riedl & Labada have opened a copper vein in the Sampson mine, near Grand Encampment, that is 3 feet wide and carries pyrites and red oxides of copper to the amount of 30 to 50 per cent.

FOREIGN.

AUSTRALIA.

At the Broken Hill Proprietary 21,163 tons of ore were treated for the four weeks ending Sept. 15th. The output from the refinery for the same period was 413 ounces gold, 404,880 ounces silver, 1998 tons lead, 73 tons antimonial lead. The copper matte contains 26 tons copper and 20,020 ounces silver.

BRITISH COLUMBIA.

Preparations are being pushed for the erection of a large stamp mill at the Ymir mine. A few months ago the London & British Columbia Gold Fields, Ltd., decided to erect a 40-stamp mill, but since then such large bodies of ore have been exposed that the company rescinded the order for the 40-stamp mill and contemplate putting up 80 to 100 stamps. They have installed a 5-drill compressor and are sinking a 100-foot shaft on the 300-foot level to ascertain the probable extent of the ore. Average assays ran \$154 to the ton. The ore chute is from 30 to 50 feet wide and it is estimated by the engineer that there is enough ore in sight to pay for the mine, developing same, putting up the mill and leave a profit of half a million dollars. Contracts have been let for 240,000 feet of lumber for flumes and mills. For the present they will use tramways to carry the ore from the mine to the mill, but will push a 3000-foot tunnel to disperse with hoisting and tramways. The Big Three G. M. Co., operating the Mascot, Southern Belle and Snowshoe at Rossland, will put in a 7-drill electrically driven air compressing plant, hoisting engine and drills. The dynamo is a three-phase synchronous motor, and will deliver 100 H. P. at a speed of 900 revolutions per minute. This will be the second electrically operated compressor plant in Rossland, and, in fact, in Canada. The War Eagle plant, now in transit, will be the first. Several other mining companies contemplate the installation of electrical plants. The final payment of \$15,000 has been made on the Pothook group of claims at Kamloops. They pass to an English company, of which H. Croft is the head. Work is being pushed on the tunnel on the Humming Bird claim at Boundary Creek. There are on the dump seventy tons of mineral which assays \$30. The second payment on the Slocan Boy deal has been made by J. L. Retailack. This mine was bonded to him several weeks ago for \$50,000 and a 10 per cent payment made at the time. This second payment was also 10 per cent.

J. F. Bledsoe of Vancouver, B. C., says that Vivian & Sons of Swansea are arranging to have a cargo of ore shipped to them from properties on Texada island, with a view to determining whether there is enough of certain kinds of ore to justify them in putting a smelter on the British Columbia coast.

Rossland Miner: At the War Eagle, at the 625-foot level, sinking is going ahead. At the 500 level drifting is in progress, and the ledge is 30 feet wide with 10 feet of good smelting ore, while the rest is of a silicious nature, adapted to milling. The British Columbia Bullion Extracting Co., which has a contract for treating 4000 tons of the silicious ores from the War Eagle dump, has nearly completed its plant, and will probably commence treating the ore in a few days. At the Le Roi the shaft is down to the 760-foot level and is being timbered. The west drift at the 700 level is about 200 feet; the west 600-foot level is also in promising shape. Recent ship-

ments for the week amounted to 2565 tons—the largest amount of ore produced in a single week by any mine in the camp. About 260 men are at work, operating twenty-six drills. At the Monte Cristo the work of development is in progress in the 300, 400 and 600 foot levels.

CANADA.

The Canadian Mining Annual shows that mining enterprises in Canada are on the increase. The geological survey places the total value of the mineral output for 1897 above \$28,000,000, or an increase of \$6,000,000 over the previous year. The output is divided as follows among the principal mining provinces: British Columbia, \$10,455,268; Nova Scotia, \$6,000,000; Ontario, \$5,000,000; Quebec, \$2,063,266; Northwest Territories and Yukon, \$3,000,000.

JAPAN.

The manganese ore mined in Hakodate, at the Setani mines, in 1897, was 5200 long tons, nearly all of which was exported.

LOWER CALIFORNIA.

Gold bullion to the amount of \$1100 was shipped to San Diego from the gold mine at Escondido, a large bar from the Reconquista mine at Jacalitos and bullion valued at \$1027 from Alamo.

MEXICO.

At Nacosari, Sonora, the Copper Queen Co. is opening a group of copper and silver mines, and has a narrow-gauge road six miles in length and a smelter running. At Mesa Quemada, Sonora, the shaft on the Francesa mine is 200 feet deep, showing a vein of \$9 gold ore over 20 feet wide. The tunnel which cuts the Guillerma mine is in 100 feet. This shows a large vein of \$10 ore, and the Giant Zodiac is also being developed, experiments showing that it is adapted to the cyanide process.

Near Monterey there are two smelters in operation, the larger having a daily capacity of 500 tons, which, in 1897, produced 7,076,544 ounces of silver, 23,330 ounces of gold, and 22,912 tons of lead. The smaller smelter has a capacity of ninety tons daily. The larger has ten blast furnaces, while the smaller has six water jacket furnaces of a capacity of ninety tons daily and three revolving furnaces of forty tons per day. The annual output of ore amounts to 112,000 tons. Twenty thousand tons of coke and 5000 tons of coal are annually consumed at the smaller smelter, and a proportionate amount at the larger. Of lead 30,740,942 pounds were produced in the smaller smelter from May 1, 1897, to April 30, 1898, and 39,683 pounds of silver and 661 pounds of gold during the same period. From 400 to 500 men are employed at the smelter, the daily payroll of the latter being about \$1000 in Mexican money. Laborers at the smaller smelter receive from \$1 to \$5 daily in Mexican money, and are paid weekly. Skilled labor is paid monthly. Salaried officers receive from \$100 to \$600 in Mexican money monthly. Both establishments do a large business with the United States, the products being shipped, and practically all supplies being obtained therefrom.

R. Bartlett has sold his bond on the Santa Gertrude mine in Sonora to J. D. Wilbur of San Francisco who will at once put in machinery and work the mine.

ONTARIO.

Near Mine Center the Olive mine shipped \$1200, the product of a week's run from a 2-stamp mill. The average yield of the ore was \$46 per ton.

Commercial Paragraphs.

The Gates Iron Works, Chicago, Ill., has an order for the machinery for a 1000-barrel cement plant in England.

SCHILLING & SONS recently shipped a 25 H. P. improved model Golden Gate gasoline engine and hoisting outfit to the Inyo Mining and Development Co., Keeler, Inyo county, Cal. They have also just shipped one of their Golden Gate engines to the Ribbon Rock Gold Mining Co., Jamestown, Tuolumne county, to operate a blower and pumps.

The Simonds Saw Co. have moved into the building No. 33 Market St., where they will carry a large stock of goods and enjoy better facilities for conducting their business, manufacturing saws, knives, repairing, etc., as well as a more central location.

In Siskiyou Co., Cal., at the Oro Fino mine, near Fort Jones, a third improved Evans elevator, together with a large consignment of the Evans riffles, also several of the Rusby patent ball bearing giants, have recently been shipped and will soon be placed in position. This is the third Evans elevator that Supt. Rusby has placed on this old time property, which is now being operated in splendid shape under the Evans system. The Risdon Iron Works are also shipping a very large Evans elevator, which will weigh in the neighborhood of ten tons, to the Aromas Mining Company on the Salmon. This elevator will have a throat 18 inches in diameter and will utilize about 2000 inches of water per day. This machine will elevate about 40 feet.

The Edward P. Allis Company of Milwaukee report considerable demand for the new Leyner drill and that the results obtained from every drill sold are satisfactory, mine managers being quick to see the advantages the drill possesses. The following are a few of the plants sold during the last two weeks: Four drill plant to Auburn, Cal., four drill plant, Ground & Irwin, Carthage, Mo., five drill plant, Ingauran Copper Co., Mexico, two drill plant, T. J. Steers, Joplin, Mo., three drill plant, Swansea Mining Co., Tintic, Utah, four drill plant, Kerr, Brownlee & Co., Webb City, Mo., and two drill plant, Chas. Boyd, Aurora, Mo. This company is also putting on the market a new hand rock drill suitable for prospectors and leasers, to be used where power is not available and judging from the number of inquiries received the Allis Co. say they expect to do a large business in this particular branch.

A REVOLUTION IN FREIGHTING.

THESE WAGONS ARE ESPECIALLY ADAPTED FOR STEAM FREIGHTING; CAPACITY OF TRAIN 50 TONS.

“The Daniel Best” 50-Horse Power Traction Engine.

The most powerful and only Successful and Practicable Road Engine in the World. Over sixty of them in use in this State, and they are being Successfully and Profitably Employed in Hauling Logs Lumber, Ore, Salt, Borax and other kinds of freight. The work is being done **FIFTY PER CENT** Cheaper than it is possible to do with Animal Power. They can be operated over any ordinary road where it is practicable to use mules or horses, doing the same work. They can ascend or descend grades as much as 20 to 30 inches to the rod, hauling their loads of 35 to 40 tons, depending upon the condition of the roads; loads may be increased to even greater amount on moderately level roads. Send for descriptive Circulars and price List of Wagons and Engine. We solicit correspondence. No trouble to answer questions. Estimates made for complete Steam Freighting Outfits. Address

MINERS, ATTENTION!

We beg to call attention to our RISDON HAMMERED PROJECTILE STEEL SHOES AND DIES, which are made of a special quality of steel, are hammered and then compressed in moulds so as to give the greatest possible density.

These Shoes will outlast any other make and will not chip or cup. We have attached a sketch showing sizes; fill in the size of your Shoes and Dies, and order a trial set.

Our prices are as low as any, and the article we offer should commend itself to all mine owners and mill men.

32 FIRST STREET, SAN FRANCISCO, CAL.

THE COLORADO IRON WORKS CO.,

DENVER, COLO.

Established 1860. + ENGINEERS AND MANUFACTURERS OF

Ore Milling and Smelting Equipments.

We beg to call attention to our

High Speed Special Rolls

as being the most efficient and the most economical machine for fine dry crushing ever placed upon the market. The rolls having

NARROW FACES and LARGE DIAMETERS

can be fed evenly over the whole width of faces with certainty, and hence the faces or crushing surfaces are easily kept true. Descriptive pamphlet on application.

HIGH SPEED SPECIAL ROLLS, WITHOUT HOUSING.

Double rope tramways are acknowledged to be superior to those of the single rope type, and any one contemplating the erection of a tramway should investigate the merits of the . . .

THE ONLY AUTOMATIC TRAMWAY BUILT.

FINLAYSON PATENT AUTOMATIC WIRE ROPE TRAMWAY.

In this system the cost of transportation is brought below any figure heretofore reached. Its tonnage capacity is unsurpassed. Further information on application.

NEW LEYNER ROCK DRILLS

REQUIRE LESS THAN

1/2 THE AIR AND IS 1/2 THE WEIGHT

OF THE ORDINARY PISTON TYPE ROCK DRILL.

PATENTS

DEWEY, STRONG & CO'S PATENT AGENCY.

Our U. S. and Foreign Patent Agency presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American reports, with full copies of U. S. Patents since 1872. All worthy inventions patented through Dewey, Strong & Co's Patent Agency will have the benefit of a description in the *Mining and Scientific Press*. We transact every branch of patent business, and obtain patents in all countries which grant protection to inventors. The large majority of U. S. and foreign patents issued to inventors on the Pacific Coast have been obtained through our agency. We can give the best and most reliable advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and circulars free.

VULCAN ROPEWAY

— WITH —
AUTOMATIC ORE LOADER AND
AUTOMATIC DUMPING DEVICE.

For Conveying
Ore, Cordwood,
Etc.

EMPIRE, NEVADA, April 17, 1896.

Vulcan Iron Works.—GENTLEMEN: The Ropeway furnished by your company to convey tailings from Morgan Mill to Mexican Mill, a distance of seven-eighths of a mile, is giving entire satisfaction. We transport 300 tons of tailings in ten hours; one man does the whole business, including elevating tailings from hopper in the ground, operating Vulcan self-loader, and attending to the Ropeway generally. The self-dumper requires no attention whatever. The Vulcan loader I consider the best feature in the whole Ropeway, making it possible for one man to load 200 tons in ten hours.

Yours very truly,

J. P. WOODBURY, Supt.

5th and Brannan

Double-Jointed Ball-Bearing Hydraulic Giants.

The above presents an improved Double-Jointed Ball-Bearing Hydraulic Giant which we build. The improvement consists of the introduction of a Ball Bearing by which the pressure of the water is reduced to a minimum and the direction of the nozzle changed at will with ease.

Catalogues and prices of our specialties of HYDRAULIC MINING MACHINERY furnished upon application. JOSHUA HENDY MACHINE WORKS, 38 to 44 Fremont St., San Francisco, Cal.

Modern Methods

Denver Office 1328 17th Street.

CANTON STEEL COMPANY,

Works: CANTON, OHIO.

CANTON EXTRA DRILL STEEL, WARRANTED.

Canton Drill Steel is a strictly hammered steel made exclusively from one brand of stock which the experience of years has demonstrated to be the best for producing the greatest combination of hardness and toughness.

There is no mystery in the art of working it. Clean fire, clean water and the same good judgment employed in working any imported steel will produce the tough, strong bit for hard rock mining.

Market Reports.

The Markets.

SAN FRANCISCO, Sept. 29, 1898.

SILVER.—London, 28 $\frac{3}{4}$ d; New York, 61 $\frac{1}{2}$; San Francisco, 61 $\frac{1}{2}$; Mexican Dollars, 47 $\frac{1}{2}$ @ 47 $\frac{1}{2}$. The Indian demand for silver increases. Bars this week touched the highest figure since the beginning of 1897. Spain is reported to be "a sparing purchaser." New York exchange, sight, 17 $\frac{1}{2}$; telegraphic, 20.

LEAD.—New York reports "weak;" exchange, \$3.92 $\frac{1}{2}$; brokers', \$3.83 $\frac{1}{2}$. Local, pipe, 6@6 $\frac{1}{2}$ c; sheet, 6 $\frac{1}{2}$ @7c; pig, 5 $\frac{1}{2}$ c; bar, 6c.

Regarding lead and zinc in general, *Iron and Steel* says: "The demand for lead and zinc has been on the increase during the entire year and prices advanced last week to the highest quotations recorded in recent years. The increase has been so great that mine owners in the Missouri districts have become so dubious of the ore brokers and mill men that the market is being quietly manipulated by the smelting companies in the Southwest. Last week the zinc market reached \$34 a ton at St. Louis and \$32.50 at the mines when it was \$1 a ton more than the price at the mines during the corresponding week of last year and an advance of \$3 over the preceding week. Last week's output of 1,910,720 pounds was greater than the corresponding week of last year, but the lead output showed a falling off of 20,530 pounds. Leading zinc men attribute the strength of the market to the increased uses of zinc."

"Ore buyers attributed the sharp advance to the demand for high grade ore from some of the smelters that were forced to have large quantities in order to profitably smelt the low grade ores they had on hand. This, however, is but a minor factor in the results obtained, as the fight between the smelting corporations and the manipulation that is going on among the brokers is considered to be the real cause of the increase in price, and as long as the smelters continue to buy the market will continue firm, even if it does not advance still higher. The increase in the use of zinc is to be noticed in the increased use of iron and steel, especially steel sheets and roofing plates, for purposes of shipbuilding and the smaller trades. The market price has increased abroad and the lead and zinc mines of other countries have felt the benefit of the expanding demand and higher prices. The Missouri district has taken the lead in the lead and zinc industry, and the district total for thirty-five weeks this year was 294,124,230 pounds of zinc and 37,692,230 pounds of lead. The total value of this product was \$4,304,399."

COPPER.—New York reports Lake, \$12.25 @ 12.37 $\frac{1}{2}$.

A Boston copper talk says: There has been much discussion in copper mining circles of late over what has appeared to some to be an anomalous situation in the copper market. The copper market is not so much an open field as the positive quotations would seem to indicate. Copper is not bought and sold daily on this side of the Atlantic at open market rates. It would indeed be difficult to quote the actual copper market at present. Some people hold that the copper market is strong at 12 $\frac{1}{2}$ c; others say it is weak at 12 $\frac{1}{2}$ c. As a matter of fact, copper is not selling at either price, and it might not be possible to buy it at either price. What has been done in the copper market can be told. When the market had receded from 12c to 11 $\frac{1}{2}$ c and appeared quite weak, the Calumet & Hecla, which deals only with its customers, notified the manufacturers that they could have all the copper they wanted for this year's delivery at 11 $\frac{1}{2}$ c if they would then announce the amount desired. Round lots were sold at this price, and then the company withdrew from the market. Thereupon there was quite a spurt in the price and a very great demand. The Calumet then offered to their customers a "second helping" at 12 $\frac{1}{2}$ c. The demand this time appeared greater than before, but the company told its customers to take all they wanted for this year's delivery, and many million pounds were sold at this price. The Calumet then again retired from the market with a nominal asking price of 12 $\frac{1}{2}$ c, but copper can probably be purchased under this figure of other interests. Still, Calumet is out of the copper market for the time being, but will have copper to sell later in the year. At the present time it is simply willing that other people should do the selling.

Business in this country is increasing, but the foreign situation is a little weaker. No material decline in copper prices this year is expected, but if the foreign situation does not improve the increase in American consumption next year may not keep pace with the increased American production.

All copper people are figuring upon lower prices for copper two or three years hence, as the present price of copper will of course stimulate production. Copper mining in Arizona is certainly booked for a very large increase in output.

IRON.—American, soft, \$20 and \$22 per ton; Scotch, \$23.

SPELTER.—Unchanged, 5 $\frac{1}{2}$ @5 $\frac{1}{2}$.

TIN.—Menlo Roofing, redipped, \$7; English, to arrive, \$4.50; Pig, 18c; Bar, 19c.

ANTIMONY.—9 $\frac{1}{2}$, 10.

BABBITY METAL.—10-12-14—best 16c.

QUICKSILVER.—Weaker. Domestic, \$40; export, \$36.50; carload lots, special rates.

POWDER.—F. o. b., San Francisco: No. 1, 70% nitro-glycerine, per lb., in carload lots, 15 $\frac{1}{2}$ c; less than one ton, 17 $\frac{1}{2}$ c. No. 1* 60%, carload lots, 13 $\frac{1}{2}$ c; less than one ton, 15 $\frac{1}{2}$ c. No. 1* 50%, carload lots, 11 $\frac{1}{2}$ c; less than one ton, 13 $\frac{1}{2}$ c. No. 2, 40%, carload lots, 10c; less than one ton, 12c. No. 2* 35%, carload lots, 9 $\frac{1}{2}$ c; less than one ton, 11 $\frac{1}{2}$ c. No. 2* 30%, carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car

728 kegs, \$1.50 per keg; less car lots, \$2 per keg.

FUSE.—Triple tape, \$5.10 per 1000 feet; double tape, \$4.35; single tape, \$3.45; Hemp, \$3; Cement No. 2, \$4.35; Cement No. 1, \$3.45. **CAPS.**—3x, \$5.50 per 1000; 4x, \$6.50; 5x, \$8; Lion, \$9.

COAL.—San Francisco coast, yard prices: Wellington, \$8.00 Coos Bay, \$5.00 Seattle, 6.00 Southfield, 7.50 Cargo lots, Eastern and foreign: Wallsend, 7.50 Cumberland, \$10.00 Brymbo, 7.50 Cannel, 9.50 Pennsylvania, hd., 14.50 Welsh Anthracite, 12.50 Scotch, 8.00 Rock Springs, 7.60

COKE.—Foreign, \$18; domestic, \$12 per ton.

OILS.—California Castor, pure, cs., \$1.12 per gal.; bbl., \$1.07; pure No. 2, cs., 85c; bbl., 80c; Baker's AA Castor Oil, in case lots of 200 gals. and upward, \$1.11; less than 200 gals., \$1.20; in bbls., 4c per gal. less than case; Baker's Crystal, \$1.50; China Nut, 52c; Linseed, strictly pure, boiled, bbl., 43c; cs., 45c; raw, bbl., 41c; cs., 46c; lots of 5 bbls., 1c less; Lucol, boiled, bbl., 38c; cs., 43c; raw, bbl., 36c; cs., 41c; lots of 5 bbls., 1c less. Kerosene—Pearl, cs., per gal., 17c; Astral, 17c; Star, 17c; Eocene, 19c; Extra Star, 21c; Elaine, 22c; Water White, bulk, in tanks, 11 $\frac{1}{2}$ c; Mineral Seal, iron bbls., 21c; wooden bbls., 23 $\frac{1}{2}$ c; cs., 26c; Mineral Sperm, 27c; Deodorized Stov. Gasoline, bulk, 12 $\frac{1}{2}$ c; do., cs., 13c; 86 deg. Gasoline, bulk, 20c; do., cs., 25c; 63 deg. Naphtha or Benzine, deodorized, in bulk, per gal., 11 $\frac{1}{2}$ c; do., in cs., 16 $\frac{1}{2}$ c; Lard Oil, Extra Winter Strained, bbl., 56c; 61c; No. 1 bbl., 45c; cs., 51c; Neatsfoot Oil, bbl., 65c; cs., 70c; No. 1 bbl., 55c; cs., 60c; Sperm, crude, 60c; Natural White, 65c; Bleached do., 70c; Whale Oil, Natural White, 40c; Bleached do., 45c; Cocoa, cs., 55c; Pacific Rubber Mixed Paints, white and house colors, \$1.25 @ 1.35 per gal.; wagon colors, \$2 @ 2.25.

CHEMICALS.—Cyanide of potassium, jobbing, 30 @ 31c per lb.; carloads, 29c; in 10-lb. tins 37c; sulphuric acid, 2 $\frac{1}{2}$ c per lb. 66% B.; soda ash, \$1.60 per 100 lbs. 55%; hyposulphite of soda, 2 $\frac{1}{2}$ c per lb.; blue vitriol, 4 $\frac{1}{2}$ c per lb.; borax, refined, 5@6c per lb.; chlorate of potash, 9 $\frac{1}{2}$ @10c; roll sulphur, 2 $\frac{1}{2}$ c; alum, \$1.90 @ 2.00; flour sulphur, French, 2 $\frac{1}{2}$ @2 $\frac{1}{2}$ c; California refined, 1 $\frac{1}{2}$ @1 $\frac{1}{2}$ c; nitric acid, in carboys 8c per lb.; caustic soda, in 10-lb. tins 15c per lb.; Cal. s. soda, bbls., 65c; sks., 60c @ 100 lbs; chloride of lime, spot, 2.10 @ 2.25c; saltpeter, 15c; chlorate of potash, 25c; caustic potash, 12c.

CORDAGE.—Manila Rope, 10 $\frac{1}{2}$ c; Sisal Rope, 9 $\frac{1}{2}$ c; Duplex Rope, 8 $\frac{1}{2}$ c.

CANDLES.—Electric Light Candles—6s, 16 oz., 7 $\frac{1}{2}$ c; 6s, 14 oz., 6 $\frac{1}{2}$ c; 6s, 12 oz., 5 $\frac{1}{2}$ c; 6s, 10 oz., 4 $\frac{1}{2}$ c; Granite (Mining) Candles—6s, 16 oz., 8 $\frac{1}{2}$ c; 6s, 14 oz., 7 $\frac{1}{2}$ c; 6s, 12 oz., 7 $\frac{1}{2}$ c; 6s, 10 oz., 6 $\frac{1}{2}$ c. Paraffine Wax Candles—1s, 2s, 4s, 6, 12s, white, 8c; colored, 9c.

NAILS.—List per keg: No. 20 to 60d, wire, \$2.35; cut, \$2.25; 10 to 20d, wire, \$2.40; cut, \$2.30; 8d, wire, \$2.45; cut, \$2.35; 6 and 7d, wire, \$2.55; cut, \$2.30; 4 and 5d, wire, \$2.65; cut, \$2.40; 3d, wire, \$2.80; cut, \$2.55; 2d, wire, \$3.05; cut, \$2.95. In carload lots, 10c per keg less.

Mining Share Market.

SAN FRANCISCO, Sept. 29, 1898.

About 97% of the amount required by the the Comstock drainage and deep mining committee has been pledged by the different companies, and plans and propositions are now in embryo as to the details and cost of the preliminary work. Pending the commencement of such work the stock market is not overly buoyant.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey, Strong & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR THE WEEK ENDING SEPTEMBER 30, 1898.

611,007.—PADDLE WHEEL.—D. Abbott, San Jose, Cal.
611,084.—Hook.—C. L. Baker, Watford, Cal.
611,087.—PLOW.—P. Bayer, Knight's Ferry, Cal.
610,889.—ICE LOCOMOTIVE.—Bowles & Hansbrough, S. F.
611,062.—RIFLE ATTACHMENT FOR SHOTGUNS.—H. A. Darms, Napa, Cal.
611,114.—BRUSH.—D. B. Forward, Alturas, Cal.
611,032.—ANTI-FRICTION BEARING.—T. R. Garnier, Los Angeles, Cal.
610,886.—FIRE KINDLER.—G. I. Green, Petaluma, Cal.
611,118.—POPCORN PRESS.—A. C. Grube, Los Angeles, Cal.
611,173.—DRILL.—J. L. Jones, Starbuck, Wash.
610,992.—ROTARY SAND PUMP.—J. Mann, Butte City, Cal.
610,994.—GAS FROM OIL.—F. L. Martenette, Chico, Cal.
611,208.—PRESERVING WOOD, ETC.—V. D. & H. R. Rood, San Diego, Cal.
611,005.—SWIMMING APPLIANCE.—S. Stone, Quillayute, Wash.
610,927.—TROLLEY.—O. W. Swanson, Tacoma, Wash.
611,025.—CAR COUPLING.—H. H. Warner, Tacoma, Wash.

NOTE.—Plain and Certified Copies of U. S. and Foreign patents obtained by Dewey, Strong & Co., by mail or telegraphic order. American and Foreign patents secured, and general patent business transacted with perfect security, at reasonable rates, and in the shortest possible time.

PACIFIC EXPLORATION COMPANY

Finds buyers or working capital for meritorious mines or good prospects. Correspondence invited. W. E. Holbrook, Pres't. L. F. Haskell, Sec'y. 29-30 Chronicle Building, S. F.

Placer Miners' Attention

It is called to the fact that we are purchasers of

OSM-IRIDIUM

In lots of one ounce and upwards.

SELBY SMELTING & LEAD CO., 416 Montgomery Street, San Francisco.

For Sale.---A Bargain.

35 H. P. HERCULES GASOLINE HOIST.

New and first-class in every particular; geared to 700 feet per minute; all latest improvements; made in sections weighing not over 1000 pounds each.

Outfit built to order; has never been used; price very low; builders will give full guarantee.

Address MINER.

P. O. Box 2684, S. F.

WEST COAST OF MEXICO.

WÖHLER, BARTNING Suc's, Mazatlan (Sinaloa), Mex.

Bankers, Importers, Exporters and Commission Merchants.

Representatives and Agents of the principal Mining Companies in the State of Sinaloa and the dependencies of the Pacific coast in the States of Durango, Chihuahua, Sonora, Lower California and Jalisco.

ORE BUYERS AND EXPORTERS. - MINING SUPPLIES.

THE BUCYRUS COMPANY,

DESIGNERS AND BUILDERS OF

DREDGES, STEAM SHOVELS, EXCAVATING MACHINERY, WRECKING CARS, LOCOMOTIVE CRANES, PILE DRIVERS, CENTRIFUGAL PUMPS, WITH SIMPLE, COMPOUND OR TRIPLE EXPANSION ENGINES,

MACHINERY FOR PLACER MINING. SOUTH MILWAUKEE, WISCONSIN.

MILL OWNERS AND MANAGERS

Write us for particulars for use of the

Webster System of Steam Heating.

It will save you money.

FOR SALE CHEAP.

Heavily Timbered Scow, 150x60x8 Ft.
S. G. HINDES, 22 California St., S. F., Cal.

FOR SALE.

ESTABLISHED ASSAY OFFICE IN S. F.
First-class apparatus. Inventory \$950. Will teach
assaying to buyer. Selling price \$900. C. D. K.,
care of Mining and Scientific Press.

For Sale: in San Francisco,

COMPLETE ASSAY AND LABORATORY
OUTFIT.

Office furnishings, including Hoskins furnaces,
Berthel balances, chemicals, glass and earthen-
ware apparatus, roll-top desk, bookcases, etc., etc.
At a bargain. Address ASSAYER, Mining and
Scientific Press Office, San Francisco, Cal.

Mine and Mill Superintendent

Will be open for an engagement Oct. 1, '98.
Highest References Furnished.

Can also do Mine Surveying, Mapping and As-
saying. Competent to take full charge of a gold
or silver property anywhere.

As to terms, qualifications, etc., address F. G.,
Mining and Scientific Press Office, San Francisco.

WANTED.

METALLURGIST and PRACTICAL
SMELTER

Will be open for engagement October 1st as
Superintendent of Copper or Lead
Smelting Works.

Thoroughly competent in analyzing, assaying,
and handling men. Speaks Spanish. Excellent
references. Address SMELTER, care Mining and
Scientific Press.

COPPER MINES WANTED

— ALSO —

A Good Dividend - Paying
Gold Mine.

Address "MINING ENGINEER," P. O. Box No. 1,
ROSLINDALE, MASS.

W. & P. PREPARED ROOFING.

For Mills and Factories.

Will not burn like shingles, nor be eaten out like
iron by fumes, gases or vapors. Cheap. Durable.

PACIFIC REFINING & ROOFING CO.

113 New Montgomery St., S. F.

Correspondence solicited.

Silver City Reduction Co.,

SILVER CITY, GRANT COUNTY,

Purchasers and Smelters of Gold,
Silver and Copper Ores.

This Plant is Owned and Operated by the Estate
of the Late Senator George Hearst of California.

To Our Customers and Friends
on the Pacific Coast :

Through frequent complaints made
to us, we have learned that unprin-
cipated and dishonest dealers on the
Pacific coast have counterfeited our
trademark numbers and substituted
inferior, spurious goods as ours, when
ours were distinctly ordered, thus de-
frauding the customers and injuring
our trade and reputation.

Our goods are acknowledged to be
the best, and are fully warranted by
us, and are marked with our name or
initials or with our well-known trade-
mark and catalogue numbers.

We request direct notice if any goods
alleged to come from us, or bearing our
trademark or numbers, prove to be
other than the best, and perfect in
every respect, as we will follow up and
expose such frauds for our customers'
and our own protection. We have no
exclusive agents on the Coast, but our
goods are obtainable from all respect-
able dealers in drawing materials,
stationery, hardware, artists' material,
etc. Respectfully,

KEUFFEL &

ESSER CO.,

New York.

Assessment Notices.

EUREKA CONSOLIDATED DRIFT MINING COM-
pany—Location of principal place of business, Forest
Hill, Placer County, California.

Notice is hereby given, Direct at a meeting of the
Board of Directors, held on the 12th day of September,
1898, an assessment (No. 13) of one-half cent
per share was levied upon the capital stock of the
corporation, payable immediately in United States
gold coin, to the secretary, at the office of the
company, Nos. 1209-11 Claus Spreckels building, San
Francisco, California.

Any stock upon which this assessment shall re-
main unpaid on the 13th day of October, 1898, will
be delinquent and advertised for sale at public
auction; and unless payment is made before, will
be sold on TUESDAY, the 1st day of November,
1898, to pay the delinquent assessment, together
with the costs of advertising and expenses of sale.

By order of the Board of Directors,
J. J. CRAWFORD, Secretary.
Office—Nos. 1209-11 Claus Spreckels building, San
Francisco, California.

MARINA MARSICANO GOLD MINING COM-
pany—Location of principal place of business, Sunny
Hill, Shasta County, California.

Notice is hereby given, that at a meeting of the
Board of Directors, held on the 24th day of Septem-
ber, 1898, an assessment (No. 16) of 2 cents per share
was levied upon the capital stock of the corpora-
tion, payable immediately in United States gold
coin, to the secretary, at the office of the company,
217 Sacramento street, San Francisco, California.

Any stock upon which this assessment shall re-
main unpaid on the 31st day of October, 1898, will
be delinquent, and advertised for sale at public
auction; and unless payment is made before, will
be sold on MONDAY, the 21st day of November,
1898, to pay the delinquent assessment, together
with the costs of advertising and expenses of sale.

By order of the Board of Directors,
CHARLES BOVONE, Secretary.
Office—217 Sacramento street, San Francisco, Cal-
ifornia.

Rock Breakers, Cornish Rolls, Pulverizers, Concentrators, Ore Feeders,
Hoisting Engines, Horse Power Hoisting Whims, Water Wheels, Steam Pumps, Ore
Cars, Wire Rope, Ore Buckets, Water Buckets, Skips,
Blowers and Exhaust Fans, Shafting and Pulleys, Belting, Oils and Mine Supplies.

SOLE AGENT FOR THE

Ingersoll-Sergeant Air Compressors and Rock Drills, Manganese Steel Shoes and Dies.

Estimates Furnished for Complete Plants for Hoisting Works, Smelters, Concentrators and Stamp Mills.

The Huntington Mill is so well and favorably known among mining men throughout the world that any description of it would seem superfluous. They are in use in the United States, Canada, Mexico, Central and South America, Australia, China, Japan and South Africa—in fact, wherever mines exist, and have given the best satisfaction of all quartz-crushing mills. The construction of this Mill has lately been much improved and we claim it to be the cheapest, most efficient, simplest and most durable Mill upon the market. Catalogue upon application.

MINE BELL SIGNALS.

Adopted, Used and in Force in Accordance with State Law.

For the convenience of our readers in the mining counties we print in legal size, 12x36 inches, the Mine Bell Signals and Rules provided for

in the Voorhies Act, passed by the State Legislature and approved March 8, 1893. The law is entitled "An Act to Establish a Uniform System of Bell Signals to Be Used in All Mines Operated in the State of California, for the Protection of Miners." We furnish these Signals and Rules, printed on cloth so as to withstand dampness. 50 Cents a Copy.

TABLE OF CONTENTS.

ILLUSTRATIONS.—Showing the Boiler, Supply Pipe and Pressure Gauge; Showing the Furnace End of the Boiler; Showing the Construction of the Triple Riveted Joint; Showing the First Leak; Leakage at the Triple Riveted Joint; Leakage at the End of Test; Style of Joint Adopted in Experimental Boiler, 349. A Triple Riveted Joint, with Stay Bolts, 352.
EDITORIAL.—Work on the Comstock; Lured to Death; Colorado to Celebrate the Discovery of Gold; Will Be Greatly Benefited; Ruling of the Supreme Court of New Mexico; To Treat Zinc-Lead Ores; A New Decision; Power to Riveting Machines; The Federal Steel Co.; Losses Through Forest Fires; "Assessment Work," 350.
MINING SUMMARY.—From the Various Counties of California, Nevada and Other Pacific Coast States and Territories, 357-58-59.
THE MARKETS.—The Local Markets; Mining Share Market; Sales in San Francisco Stock Board, 370.
MISCELLANEOUS.—Concentrates; The Biggest Mine of All, 351. Test of an Experimental Boiler; Stamp Mill Practice, 352. Great Mining Enterprises vs. Small Ones; Showing of Metals, 353. A New Incandescent Filament for Electric Lights; Crushing Rolls; Improvements in Gold Extraction, 354. Coast Industrial Notes; Personal; List of U. S. Patents for Pacific Coast Inventors; Notices of Recent Patents; Recently Declared Mining Dividends; Recent California Mining Incorporations; Commercial Paragraphs, 355. "Softening" Water; Nickel and Cobalt; A Gigantic Terrestrial Globe; Is Darwinism True? Competition of Gold and Worn Coins; Photographic Clockwork Watches; Foulton; Largest Tin Plate Establishment in the World, 356. New Books; Catalogues Received, 359.

A RECENT ruling of the Supreme Court of New Mexico, to the effect that one can locate a mining claim on an unconfirmed grant, and if the courts refuse to confirm it the location will hold the same as if it were made on known public domain, is considered to be a settlement of a long disputed question in that region of old Spanish land grants.

THAT portion of southern Nevada to be traversed by the projected Utah & Pacific Railway will be greatly benefited by the improved transportation facilities. There is considerable there of what in the old days of 15c-a-pound freight was called "base metal," and let alone, but which with improved methods and lower rates can be profitably worked.

EVEN among the present consolidation of great interests, and the formation of huge trusts, is noticeable the formation last month of the Federal Steel Co., incorporated in New Jersey, with a capital stock of \$200,000,000. It is a consolidation of the Illinois Steel Co., the Minnesota Iron Co., and an Illinois railroad company, with further intent to absorb an Ohio and Pennsylvania steel company.

THE States of Colorado and California, especially the latter, have this season suffered tremendous losses through forest fires, a species of destruction which particularly affects the mining industry. Strict enforcement of existing laws, and a quickened public feeling on this important subject, in place of the present reckless disregard can alone aid in stopping the general summer destruction of our forests.

WITH unusual enthusiasm, and amid surroundings that lent dignity to the occasion, California celebrated last January in San Francisco the fiftieth anniversary of the discovery of gold in California. Colorado, which now stands in the foremost rank of gold producers, proposes to celebrate next January the fortieth anniversary of the discovery of gold within the borders of that commonwealth. It was in January, '59, that Geo. A. Jackson discovered placer gold at Idaho Springs, Colo., and that event, which did so much for that State, deserves fitting commemoration.

UNDER date of Sept. 22nd, the general manager of a London, England, smelting company writes that his concern can successfully treat zinc-lead ores, and would buy them on the terms named in an article on page 225 of the issue of Sept. 3rd, '98, being the prices proffered by Eastern smelting firms. He adds that "freight is heavily against us, and \$10 for zinc expenses is too low; \$15 would be nearer, but, on the other hand, would likely give 25 cents a unit for the zinc above 22%." An article on page 304 of the issue of Sept. 24th sufficiently illustrates the impracticability of the proposition, the matter being referred to here to indicate the universal interest manifested in these matters.

Work on the Comstock.

On page 353 Almarin B. Paul suggests that if the money proposed to be spent in unwatering the Comstock, Nev., lode, with a view to deeper mining thereon, were expended elsewhere in development work in Nevada on possible new Comstocks it would be of more value to that commonwealth. He also implies that the Comstock is a "has been" and that further money spent there will be without satisfactory result.

That intelligent expenditure of money and effort in development of mining properties is productive of good results is manifest, and Mr. Paul is correct in the suggestion that Nevada has a vast mineral area that could with profit receive attention from the prospector, the miner and the investor; so has California, and every other State and Territory in this west half of America. The attention of the mining world, so far as Nevada is concerned, was, however, concentrated on the Comstock a generation ago, and the wonderful yield of that lode sufficiently accounts for the continued interest maintained.

THE MINING AND SCIENTIFIC PRESS has long argued that deeper mining on the Comstock would be profitable. It has cited facts in support of its position, and still holds to that belief. It is not prepared, however, to put implicit confidence in the present project, so far formulated, for the Comstock's revivification. The old name and fame of the Comstock have been repeatedly used to conjure with, and it is now questionable as to the true meaning and intent of the proposed work. Assuming the honesty, good intent and ability of the projectors; taking it for granted that the idea is not to work up a last "boom" on the street during which those who are loaded up with stock can have a final opportunity to dump it; but on the assumption that the idea is actuated by honest business intent to unwater the mines and go deeper, it is believed that the means as outlined are wholly inadequate. The \$100,000 proposed to be raised would not be enough to buy the requisite machinery and lower the water sufficient to resume deep mining therein. It would take at least five times that amount to push the entire project to a satisfactory conclusion.

The plan of draining the Comstock and of subsequent deeper working can be accomplished; it is merely a question of money, and it is believed that if any association of men can be induced to furnish the requisite capital, that its intelligent and economical use would ultimately result in profit to the investors, but the time has passed when the stock gambling public can be depended on to supply the money for an undertaking of such magnitude.

Lured to Death.

This paper has published a great deal of reliable statement regarding the Yukon region, and since the inception of the recent northern movement has thoroughly ventilated the heartless schemes of those who have tried to coin money out of the credulity of those who contemplated effort in that direction. That it has been reasonably successful is evinced. That many a poor fellow has lost life, health and fortune by belief in fraudulent statements is as evident. No human law can reach those who have so egregiously deceived men desirous of going to the Yukon. It is pitiful to read of the suffering and misery consequent upon such action. The following is selected as a fair sample of several similar stories:

Early in this year a party of twenty-six men left San Francisco for Dawson via the Stickeen trail. One, H. Lang, was the only one that got through. According to authentic accounts, the horrors that this big party went through are out of the ordinary, even for the Klondike records. Two of the number were drowned, two are insane, others remain far in the interior in deplorable condition. In the Chesley river seven of their ten boats were dashed to pieces on the rocks and the outfits lost. In two of the wrecks Black and Morgan of California were drowned. It was then that some of the men went insane and had to be restrained from taking their own lives. The party started up the Stickeen over the ice, determined to be the first to cross to Lake Teslin. They made forced marches, dragging heavily loaded sleds through the slush-covered ice. They were "wrecks" when they reached Telegraph creek.

There they found the promised wagon road to the lake had not been built, nor even started, but found as smooth a liar as the man who first persuaded them to take that route. With a map of his own he proved to them conclusively that the easiest way to reach Dawson City was by following the Chesley and Niline rivers into the Telin river. Accordingly they started overland for the headwaters of the Chesley river. The distance was fifty miles, and the snow was so far gone that they had to pack their outfits on their backs. They reached the river only to find it a series of rapids almost as bad as Five Fingers or the White Horse. After a great deal of hard work, they built ten small boats and started down stream, shooting rapids studded with big boulders and sunken rocks. Seven of the boats were lost with their contents and two men drowned. At last they reached a point near the Teslin river and made a portage, abandoning the three boats. On reaching the river, some remained at the trading post, others built new boats and started on to Dawson; Lang alone got through.

This is partly in answer to a question: "Why does the MINING AND SCIENTIFIC PRESS so persistently dwell upon the perils and hardships of the Yukon?" The above is sufficient reply. It is not the natural and unavoidable difficulties of gold seeking in that region that this journal has commented on unfavorably, but on the cruel, lying policy of so many unscrupulous men connected in various ways with means and routes of transportation and travel, who are morally guilty of murder for their part in the hideous record.

COMPRESSED AIR furnishes power to riveting machines in present use in the construction of a gasometer, 175 feet diam., at Washington, D. C. The tank consists of four telescopic sections, each 35 feet deep. The lower section has 3-inch steel bottom plates, side plates 1 inch thick, 6 feet wide; the rivets in the lower section are 1½, 1¼ and 1 inch in diameter; ¾-inch rivets are used in the other sections. All the riveting is done by eight yoke riveters, having a reach of 6 feet, consisting of a yoke frame made of plates and angles, upon which are mounted pneumatic hammers, four of which have a 1¼-inch piston and a stroke of 6 inches; the others have each a piston 1½ inches diameter and 5-inch stroke. Each riveter is suspended by a block and tackle from the top of a traveler supported by rollers which run on the upper edge of the side plates; the frame is held in any position by wedges driven between the upright posts and the tank plates. Compressed air is furnished at a pressure of 100 pounds to the square inch by a compressor run by steam from the boiler of the hoisting plant. Two men tend each riveter. In one day of ten hours 530 1¼-inch rivets were driven with one machine, and it is stated that 700 ¾-inch rivets is not an extraordinary day's work. A good local example of successful pneumatic riveting is to be seen in the pipe manufactory of the Risdon Iron Works, San Francisco.

In the case of Gillis vs. Downey, 85 Fed. Reports, 483, the U. S. Circuit Court of Appeals decided that the filing of an application for a patent does not suspend the obligation to keep up the required manual work where, without paying the purchase money, the claimant permits his application to sleep for years; and that upon such failure to comply with the conditions, the claim is open to relocation in the same manner as if no location had ever been made. The fact that the sixty days prescribed by Sec. 2325, U. S. Revised Statutes, for application of a notice of application for a patent has expired before the application is adverse, does not preclude a contest and the applicant's right to a patent, where the adverse claim does not arise until after the expiration of the sixty days, and where the applicant has allowed his application to lie dormant for years without either paying the purchase money or doing the required work each year.

"ASSESSMENT WORK" for the calendar year will be done to a considerable extent during the remaining eighty-four days of '98. Though fully recognizing the fact that a rich prospect is sometimes ruined by developing it, yet it would be well in doing development work to have less sinking of shallow shafts and running of short tunnels, and more sinking that would be of greater permanent use than "goph-ering."

The Biggest Mine of All.*

He was a mining engineer,
Thoroughly trained in every sphere
Of knowledge scientific;
The catalogue of things he knew,
In theory and practice, too,
Would cast a spell on me or you,
As something quite terrific.

Chemical unions he could loose
And most refractory ores reduce
To reguline condition;
And, having conquered many lands,
He sought fresh triumphs for his hands,
When, walking on the ocean sands,
He felt a new ambition.

Before him in the sunshine rolled
The largest known supply of gold,
Though somewhat low grade was it!
The stuff was soft and easily won
And carried (said Professor Don)
About nought point three cents per ton—
A wonderful deposit!

And it was uniform, no doubt;
If it were mined, year in, year out,
With proper assiduity,
It would go on and pay to man,
As no mere land deposit can,
The dividends it first began,
In endless continuity!

Besides, of such productive work
No "apex-right" or legal quirk
Could thwart the rich requital;
For everybody knows the sea
To everybody's use is free,
With neither rent nor royalty,
By immemorial title!

The sailor cleaves it with his keel
For cod or mackerel, whale or seal;
It yields the bather's toilet—
Why should not the metallurgist,
On small or large scale, if he list,
A part that never would be missed
Abstract, and simply boil it?

"The scheme's complete!" he proudly cries.
"It only needs that I devise
"My skill profound displaying,
"Some process, either cold or hot,
"Thorough and practical, and not
"Too costly, which will give me what
"The wild waves are assaying!"

He built a wondrous structure then,
Which thoughtless, undiscerning men
Despised as hocus-pocus.
It held a monstrous burning-glass
Through which the solar rays would pass
To pierce the seething, sizzling mass
Of ocean at the focus.

And then there was a coffer dam,
Which, inexperienced as I am,
I dare but slightly mention,
And wires electric—what their need
Or use, I cannot say indeed;
But they belong, it is agreed,
To every new invention.

When all was done, he calmly sat
As some contented, stately cat
Sits gravely looking at us,
And waited for the fateful day
When he should reap the golden pay
Resulting from the operation
Of his apparatus.

The process turned out cheap but slow;
He saw the seasons come and go
With patient desperation,
While bravely he would still repeat
To all the explanation neat,
That his solution was complete,
But lacked precipitation.

His eyes grew dim, his hair grew white,
His creditors forgot him quite;
The speculative fever
Had ceased, except in him, to burn—
They did not even care to turn,
And get the leaky old concern
Attached to a receiver.

At last there came a stormy day
When a great wind laid bare the bay—
A most uncommon antic—
And what was more, the hurricane
Banked up the dunes along the main,
So that no drop came back again
Out of the vast Atlantic.

The aged mining engineer
At this catastrophe, I hear,
Was staggered for a minute.
But science was not long at fault;
After a transitory halt
He mined that coffer dam for salt,
And found a fortune in it!

—R. W. Raymond.

Concentrates.

In gelignite, gelatin is the base; in dynamite, infusorial rth.

About 1000 miners find present employment in and around ndon, B. C.

In English gold coins the copper alloy is one-twelfth; in merican, one-tenth.

QUICKSILVER melts at 39° F., evaporates slightly at 62°, boils 686°, and volatilizes at 680°.

The "rating" of a steam boiler is the number of pounds of iter it will evaporate per square foot of heating surface per ur.

The shipments of the Rossland, B. C., mines for the week ding Oct. 1st broke all previous records. The output was 39 tons.

The Silverton, Colo., Standard announces the discovery in e hills of San Juan of an ore body carrying 30 per cent agsten.

Recent rains at Minas Prietas, Sonora, Mexico, have filled

*Seldom do mining men lapse into verse, but at the Atlantic City elling of the American Institute of Mining Engineers, Bossiter . Raymond, the secretary, adopted this rhythmical form of com- ncatating his criticism on various efforts to extract gold from se- ster.—EDITOR.

the reservoirs and assured a long run for all the mills and cyanide plants.

PATENTED MINES are subject everywhere to assessment. In California county assessors arbitrarily assess unpatented min- ing claims at \$100.

At the Utica mine, Calaveras Co., Cal., by the cyanide pro- cess, is secured 85% of the gold assay value at a cost of \$3.50 per ton of ore treated.

ALL the ordinary ores of silver are soluble in dilute cyanide solution, the process of dissolution requiring, however, more time than in the case of gold ore.

AN electric railway seems a certainty from Colorado Springs across Pike's Peak to Cripple. The distance is about twenty-five miles. The estimated cost is \$700,000.

BUTTE, Montana, is the largest mining town in America; Houghton, Mich., the next in size; Cripple Creek, Colo., stands third, and Dawson City, N. W. T., fourth.

MEXICAN exports of silver in '97 were 55,850,000 ounces fine, valued at \$70,928,925, Mexican money. The value of silver bullion exported shows an increase of \$7,000,000 over '96.

THE British Columbia Review says that the Pilot Bay smelter will make another start, this time under the man- agement of the British East Kootenay syndicate of Cardiff.

THE 3-foot gauge road in Boulder county, Colo., cost, to build, total for the forty-nine miles, \$168,540; equipment, \$50,450. It is a great factor in the mining prosperity of that section.

THE electrical conductivity of magnesium is 41.2 per cent that of copper. It has a tenacity of 27,000 pounds per square inch. Its elastic limit in the shape of wire is 8750 pounds per square inch.

THE Board of Equalization of Trinity Co., Cal., has raised the county assessor's figures on five mining properties from \$49,050 to \$209,500. The five companies have joined issue and appealed to the courts.

THE total value of the mineral products of the United States for the year 1897 amounted to \$632,312,347. The gold produced was valued at \$57,363,000; copper, \$54,080,180; silver, (commercial value), \$93,316,000.

THREE lessees on the Matco mine, Cripple Creek, Colo., in August, netted \$38,416.55. The shipments for the month were 2,459,850 pounds of ore of a gross value of \$55,734.93. They paid a royalty of 20 per cent.

TWO cases are reported this week—one from Mariposa Co., Cal., the other from San Diego Co., Cal.—of swindlers start- ing miners to work and decamping with the mill proceeds. Those frauds are less common than formerly, but still exist.

MEXICO, in '97, imported 460,000 tons of coal and coke—an in- crease of 35 per cent over '96. About three-fourths was coal. Of the coal 55 per cent was from the United States, the re- mainder from England. About 80 per cent of the coke was American.

IN the Bushwhacker mine at Aspen, Colo., A. Baldrige, in company with S. Cole, had spit the fuse and retired to await results. The fuse of Baldrige falling to spit he returned to relight it; when he reached the breast the other shot went off and killed him.

L. BANDING, in the Sonora, Cal., Democrat, controverts a statement recently made that molybdenum lately found in Fresno county was the first discovered in California. He says that a vein 3 feet wide of sulphide of molybdenate was found near Sonora eight years ago.

IN Bisbee, Ariz., the town library, supported mostly by the Copper Queen M. Co., has 3053 bound volumes, to which 200 will be added within a month. Fifteen magazines, seven daily and twenty-five weekly papers are on file. The average monthly circulation of books is 852.

THE report of the assayer of the Denver mint shows an in- crease for September 1898 over the same month in 1897 of nearly 100 per cent. For the nine months ending September, 1898, over the corresponding period of 1897, the increase is nearly 65 per cent. The amount of bullion treated in 1898 is \$14,376,- 351.10, a gain over 1897 of \$5,938,266.54.

CENTRAL ASIA is said to be rich in gold, silver, copper and iron. Russians, though aware of this, either have not the en- terprise or the money to develop mines and are jealous of any one else exploiting the country. In the Alan Tau mountain range M. Cobbold obtained numerous specimens containing the above named minerals in his journey across the Pamirs.

REFUSAL last July of the Canadian Senate to ratify the con- tract for the building of a railway from Glenora, Upper Stick- ine river, N. W. T., to Teslin lake, made by the Canadian cabinet, wreaks present hardship on some hundreds of pros- pectors and miners in that region, by reason of suspension of work on the wagon road that was expected to connect there- with.

THE average annual production of iron ore in Sweden for each five years from '61 to '95 has risen from 453,486 tons to 1,517,434 metric tons. In '97 the output was 2,086,119 tons. In twelve iron mines there the depth varies between 200 and 275 meters; in fifty-two mines between 100 and 200 meters. Only two—the Taberg in Vermland and the Dalkarlsberg in Nerike—have reached a perpendicular depth of over 300 meters.

IN Boulder county, Colo., there are being built four stamp mills of a total daily capacity of 200 tons, and one chlorination plant of fifty tons capacity a day. In San Juan county mills are building of 400 tons total capacity in twenty-four hours. At Leadville a large concentrator and cyanide plant is being built on the Resurrection mines. It is estimated that these new plants will add \$5400 a day to the gold output of the State.

IN the case of Hartman vs. Smith, Montana, 19, the court decision was that: "all that is necessary to make the claim of a mill site by the owner of a non-contiguous mining claim valid, is the reasonable use and occupation thereof for mining purposes in connection with a mining claim. A mill site may be patented by compliance with the same requirements re- garding survey and notice as are applicable to mines or lodes."

ISAAC BANTA, who some years ago had a "secret sluice pro- cess" for treating gold beach sands, is reported working in Clallam Co., Wash., on the ocean beach along the straits of Fuca, at Ozette, where eight machines and thirty men are to secure in fine flour gold \$7.50 per day per man. A full descrip- tion of the machine and the process, furnished by one of the firm then interested therein, was published in the issue of April 25, 1896.

IN the California Supreme Court this week another and a final decision was given in the Fox vs. Hale & Norcross case,

substantially confirming the judgment of the lower court. The plaintiff, Fox, sued the company directors for sums aggregat- ing about \$1,000,000, to be recovered because of faulty and im- perfect milling of Comstock ore, and damages. The final re- sult is a verdict for the plaintiff for \$210,197.50, with 6 per cent interest from June 11, '92, to date.

CANADIAN officials at Dawson are reported to be secretly preparing for a threatened outbreak of the miners in the Klondike district. The meetings of the miners' associations of the Yukon are rapidly becoming more pointed in their threats against the officials, especially Gold Commissioner Fawcett and his office. At the last meeting of the association 300 men clamored for justice in the recording of claims and a motion to take the Gold Commissioner's office by force and nail up the doors almost passed.

FREQUENTLY queries are received that are very difficult to answer. Usually those questions are in inverse ratio to their value. A Wyoming State official asks: "1st. What cities or towns contain the greatest number of individuals who have made their fortunes directly or indirectly through the mining industry? 2d. What cities or towns have the greatest num- ber of mine owners working mines that are paying good divi- dends, or that ever were good-paying ventures? Cities and towns referred not to exceed a population of 50,000, and to be west of the Mississippi."

THE right to repudiate a subscription to a stock company which has been obtained by misrepresentations, fraudulent or unintentional, is universally conceded. No one can be com- pelled to hold an interest in a corporation when that interest has been obtained by misstatements. But in order to make such a privilege or right operative, there must be a movement toward repudiation the moment there is knowledge of a suffi- cient cause existing. It will not do for a subscriber to stock, when he knows of fraud, to wait, and, after making ineffectual attempts to unload his liability upon others, to then enter a protest. In so doing he would not only shut himself out of any remedy by a rescinding, but would himself become a party to the fraud. One or the other horn of the dilemma must be chosen. Either he must repudiate quickly or stay in and take his chances. What constitutes knowledge is always an open question. Mere suspicion or rumor cannot beso regarded, but a subscriber to stock must use ordinary means of inquiry which are subject to his use in verifying what comes to him as the truth.

THE zinc precipitation of gold from cyanide solution is illus- trated by experiments made at the Utica mine, where a solu- tion assaying 5.7 ounces gold and 2.2 ounces silver per ton was passed through a column 14x9x140 inches, which contained twenty pounds of zinc shavings at the rate of 700 gallons (= 5850 pounds) per twenty-four hours. The column was divided into ten equal sections or compartments. Assays of the solu- tion flowing from each were:

| Compartment number. | Column inches. | Gold ozs. per ton. | Silver ozs. per ton. |
|---------------------|----------------|--------------------|----------------------|
| 1..... | 14 | 0.800 | 0.260 |
| 2..... | 28 | 0.270 | 0.071 |
| 3..... | 42 | 0.130 | 0.035 |
| 4..... | 56 | 0.058 | 0.026 |
| 5..... | 70 | 0.052 | 0.023 |
| 6..... | 84 | 0.046 | 0.001 |
| 7..... | 98 | 0.032 | |
| 8..... | 112 | 0.031 | |
| 9..... | 126 | 0.227 | |
| 10..... | 140 | 0.025 | |

The solution contained 0.3135% potassium cyanide and re- mained constant during the passage of the column.

SEVERAL questions relating to locators' rights may be an- swered by quotation from a decision of the U. S. Supreme Court, in the case of Black vs. Elkhorn M. Co. (163 U. S., 445), in which it is laid down that "the interest in a mining claim, prior to the payment of any money for the granting of a patent for the land, is nothing more than a right to the exclusive possession of the land based upon conditions subsequent, a failure to fulfil which forfeits the locators' interest in the claim. To sum up as to the character of the right which is granted by the United States to a locator, we find: (1) That no written instrument is necessary to create it. Locating upon the land and continuing yearly to do the work provided for by the statute gives to and continues in the locator the right of possession as stated in the statute. (2) This right, conditional in its character, may be forfeited by the failure of the locator to do the necessary amount of work; or if, being one among several locators, he neglects to pay his share for the work which has been done by his co-owners, his right and interest in the claim may be forfeited to such co-owners under the provisions of the statute. (3) His interest in the claim may also be forfeited by his abandonment, with an intention to renounce his right of possession. It cannot be doubted that an actual abandonment of possession by a locator of a mining claim, such as would work an abandonment of any other ease- ment, would terminate all the right of possession which the locator then had."

THE following are conclusions arrived at by the general manager of the Association des Propriétaires d'Appareils a Vapeur, in consequence of his investigations into various non- conducting substances for cleaning steam pipes and boilers. (1) Condensation in an uncledared steam pipe is rather slighter in the case of copper than in that of cast iron. (2) The effi- cacy of a cleading under the same conditions, is therefore slighter when applied to a copper pipe than to one of cast iron. (3) A non-conducting substance should be efficacious for a slight thickness; and the efficacy of a cleading does not in- crease in proportion to its thickness, while it even may be diminished with a too great thickness. These results, already pointed out by M. A. Brull, are due to the fact that the thickness of the non-conducting substance increases the sur- face exposed to cooling down, so that the loss of radiation can exert more influence than the slight conductivity of the sub- stance. (4) It is advisable to varnish plastic coatings. For instance, with cement over cork and not varnished, a conden- sation of 29.7 per cent was observed, which was reduced to 21.7 per cent when the same cement received three coats of varnish. Not only does the varnish exert a good effect as regards condensation, but it also retards disintegration of the substances used for cleading. (5) The use of zinc is advisable over any non-ducting material, the effect of which it un- doubtedly increases. For instance, the condensation in a cop- per pipe cleaded with cork was 33.8 per cent, which was re- duced to 24 per cent when the cork was enclosed in zinc. The condensation in a copper steam pipe cleaded with cork covered with a coat of cement was 29.7 per cent, which was reduced to 21.7 per cent after three coats of black varnish were added; and by enclosing the whole in zinc the condensation was further reduced to 19.2 per cent.

Test of an Experimental Boiler.

Difference of opinion exists among engineers as to the strength of the water legs of upright, internally fired boilers, the main question being, whether the action of the stay bolting is or is not substantially the same as it is in a flat water leg. In former years, when vertical boilers were comparatively small, this question was not of much import; but when the sizes were increased so that the water legs were 6 or 8 feet in diameter, the problem became a serious one.

The mathematical discussion of such a structure as a curved water leg is involved, but investigation shows that for water legs that actually occur in practice, the following conclusions are true: (1) The stresses in the plates of a curved water leg are never greatly different (at the usual working pressures) from those that prevail in a similarly designed flat stayed surface; (2) The curved form of the leg does, however, cause the tension on the outer sheet to be somewhat greater than it would be in a flat leg; (3) The stress on the inner sheet is never a compression, but always a tension; (4) This tension on the inner sheet will differ (usually by a small amount) from the tension on a similar flat stay-bolted sheet, being sometimes greater and sometimes less, according to the design and proportions of the water leg; and (5) The curvature of the leg causes the stress on the stay bolts to be somewhat less than it would be on a similar flat leg. From formulae given for calculating the effect of the curvature of the plates, both upon the shell tensions and upon the stay-bolt tension, it is concluded that within the range of pressures and proportions that are met with in practice, "the strains in a curved stay-bolted structure are not materially different from those in flat surfaces, similarly designed."

If this general conclusion were correct, it is evident that the shell joints of the water leg would be amply strong if they were simply double riveted or even if they were single riveted, provided they were carefully designed and constructed. Experience has shown, however, that in boiler practice it is not always safe to trust implicitly in the indications of an abstract mathematical formula, no matter how carefully that formula may have been prepared. This is particularly true when the structure under consideration is at all complicated; for the actual iron and steel of the shop are different things from the fictitious materials whose properties are assumed in mathematical equations. Till recently, no actual tests have been made upon curved water legs; and in the absence of such tests, the use of triple-riveted butt joints for the outside shell, in cases where large boilers are to carry heavy pressures, has been suggested.

A New Haven, Conn., company that builds steam engines and boilers, has taken a special interest in this matter, owing to the fact that it is difficult, when using a triple-riveted butt joint, to space the stay bolts properly, in the vicinity of the joint. This difficulty is a real and serious one, as all boiler makers and designers are aware. If the attempt is made to space the stay bolts along a triple-riveted butt joint precisely as they are spaced along the rest of the water leg, it will be found that even with the most ingenious arrangement, it is not possible to prevent the stay bolts and rivets from coming too closely together in many places. To obviate this difficulty, it is common to make some of the stay bolts fulfill the functions both of stay bolts and of rivets; but this almost invariably requires the pitch of the stay bolts to be modified along the joint. An example of this kind, taken from actual practice, is shown in Fig. 8 where the stay bolts are shown

ings on the outside page. Its general dimensions were as follows: Shell plate, fire-box steel, $\frac{7}{16}$ in. thick; furnace plate, fire-box steel, $\frac{5}{16}$ in. thick; upper head, fire-box steel, $\frac{5}{16}$ in. thick; lower head, flange steel, $\frac{5}{16}$ in. thick; bottom ring, forged wrought iron, $2\frac{3}{4}$ in.; length between girth seams (A to B in Fig. 3), 48 $\frac{1}{2}$ in.; diameter outside of shell, 42 $\frac{3}{4}$ in.; length of fire-box between rivets (C to D in Fig. 3), 33 $\frac{1}{2}$ in.; internal diameter of furnace, right angles to joint (EF), 35 $\frac{1}{4}$ in.; internal diameter of furnace, close to joint, outside lap (GH), 35 $\frac{1}{4}$ in.; number of tubes, 93; diameter of tubes, 2 in.; length of tubes, 15 $\frac{1}{2}$ in.; circumference of shell at KK before test, 11 ft. 4.80 in.; circumference of shell at LL before test, 11 ft. 4.81 in.

The stay bolts were pitched 4 $\frac{1}{2}$ in. from center to center, circumferentially, and 4 $\frac{1}{2}$ in. lengthwise of the boiler. They were cut from stock 1 $\frac{1}{2}$ in. in diameter and were threaded with ten threads to the inch. The diameter of each stay bolt at the bottom of the thread was therefore about $\frac{3}{4}$ in., or 0.953 in. The joint in the furnace sheet was lapped and single riveted with $\frac{3}{4}$ in. rivets, pitched 1 $\frac{1}{2}$ in. from center to center, the rivet holes being $\frac{3}{4}$ in. in diameter. The joint on the shell plate is shown clearly in Fig. 3. The ends of the sheet were butted together and each was secured to an outside strap $\frac{7}{16}$ in. thick and 7 in. wide, by means of a single row of rivets, which were pitched 2 $\frac{1}{2}$ in. apart and driven in holes that were $\frac{3}{4}$ in. in diameter. Beyond the stay-bolted part of the shell, the outer strap was increased in width and an inner strap $\frac{3}{16}$ in. thick (shown dotted in Fig. 3) was added. A triple-riveted butt strap joint was then put in at this part, the pitches being 3 $\frac{1}{2}$ in. and 6 $\frac{1}{2}$ in., while the holes were $\frac{3}{4}$ in. in diameter as before. Owing to the short space allotted to the triple-riveted section of the joint, there was only one full space of 6 $\frac{1}{2}$ in. on the outside row of rivets, the pitch between the two outside rivets nearest the furnace end of the boiler being reduced of necessity to 4 $\frac{1}{2}$ in., as indicated in the engravings. One row of stay bolts, it will be seen, was tapped into the covering strap, passing through holes drilled in the abutting edges of the outside sheet.

The boiler was supplied with water from a powerful hydraulic apparatus, through 50 feet of 1 $\frac{1}{2}$ in. pipe, which entered the wrought-iron ring at the bottom of the furnace, as may be seen in the engravings. Just as it entered the boiler, the pipe was reduced to $\frac{1}{2}$ in. in order that the ring might not be materially weakened. The pressure gauge was near the pump; it is shown in the background in Fig. 1.

When the test began, nothing was noted until the pressure exceeded 800 pounds to the square inch. Between this pressure and 1000 pounds, the shell began to show signs of distress, and the triple-riveted butt joint began to leak. The appearance of the boiler at this stage is shown in Fig. 4. The rise of pressure was so rapid between 800 and 1000 pounds that it was impossible to say at precisely what point the distortion and leakage began. The pressure was maintained at 1000 pounds while the boiler was examined. The shell had bulged at the section LL around the entire circle of the boiler except at the joint, where the straps had sufficient stiffness to prevent serious distortion. The circumference at this point was now 11 ft. 7.22 in., or 2.41 in. greater than the original measure. It was noted that about one-half of this extension occurred while the pressure was stationary, and the measuring tape was in position. The circumference was also taken at KK, and found to have identically the same value as at the beginning of the test. No leakage was observed, except along the triple-riveted butt joint.

The pressure was then raised until the gauge showed 1100 pounds per square inch, though the leakage had meanwhile become so serious that it is

doubtful if there was any actual increase in the pressure in the boiler. The circumference at KK still remained unchanged, but that at LL showed a further increase to 11 ft. 7.72 in. The appearance of the boiler at this time was again photographed, and is represented in Fig. 5. The triple-riveted butt joint was leaking badly at several of the rivets and along the outer strap, so that the pressure could not be longer maintained with any approach to steadiness. The pump was therefore stopped and the pressure removed, and the leaks were thoroughly calked. The pressure was then run up once more, till the gauge read 1250 pounds. Leakage began again at about 1000 pounds, and at 1250 pounds it was so severe that the pressure could not be increased, even with the pump running at full capacity. At this point the shell showed the same circumference at KK, but at LL it had stretched further, to 11 ft. 9 in., recovering after the release of the pressure to a permanent value of 11 ft. 8.50 in. The photograph shown in Fig. 6 was then taken, and the test was discontinued. No

severe leakage was noted either at the tube ends or along the furnace seam, either inside or outside, during the test. The furnace sheet had bulged between the stay bolts, so as to take a permanent set, in the center of each square, of about $\frac{1}{16}$ in.

Allowing 85 per cent as the efficiency of the triple-riveted butt joint, the calculated bursting pressure of the bulged part of the shell may be shown, by the usual rule, to be about 1050 pounds per square inch. It is doubtful if the actual pressure in the boiler exceeded this value by any considerable amount on account of the severe leakage which occurred when the gauge pressure was 1200 pounds or so. The triple-riveted section was so short, too, that it was undoubtedly stiffened and sustained, to an appreciable extent, by the upper head at one end, and by the stay bolting at the other. The stress on the stay bolt, per square inch of sectional area at the base of the threads, was about 31,200 pounds when the test pressure was 1000 pounds per square inch, when reckoned in the usual way—that is, by treating the curved leg as though it were flat. The formula above referred to gives about 28,000 pounds as the actual stress per square inch of sectional area under these conditions, when the curvature of the leg is taken fully into account.

The general conclusion to be drawn from this experiment is that the mathematical analysis, whose results are mentioned above, was in substantial agreement with the actual facts; and that it is not necessary, except perhaps in special cases, to provide a triple-riveted butt joint on the outer sheet of a curved and properly stay-bolted water leg. The data in this article are taken mainly from the *Locomotive*.

Stamp Mill Practice.

TO THE EDITOR:—Although stamp mill practice has made rapid advancement during the past ten years, there still remains considerable difference of opinion among manufacturers, as well as millmen, as to the best arrangement of its machinery and the best methods of running it. To even briefly describe these differences would take up too much of your valuable space for a single article; therefore but one of its features will now be considered, viz., the rotation of the drop of the stamps as usually found in the modern stamp mill.

The most common rotation met with (and we believe the best) is where the stamps drop in the order of 1, 3, 5, 2, 4 or 1, 4, 2, 5, 3, which is the same in reverse order. Another quite frequently met with is 1, 5, 2, 4, 3 or its reverse order 1, 4, 2, 3, 5. There are other eccentric variations made by the sometimes too original millwright, but we will confine ourselves to the two just mentioned. In either case where ten stamps are run by one cam shaft, those in one battery are arranged a one-half drop in advance of those in the other, to better equalize the load, so the drop of the ten stamps in the first named system would be 1, 6, 3, 8, 5, 10, 2, 7, 4, 9, or the reverse: 1, 6, 4, 9, 2, 7, 5, 10, 3, 8.

The ideal rotation would seem to be that which would produce an even distribution of the pulp under the stamps and a correspondingly even splash and discharge through the screens. To reach this result in a 5-stamp battery no stamp should drop directly after the one next to it, but there should at least intervene one stamp. One reason for this is that, at the moment the stamp drops, those next on either side of it should be raised sufficiently to allow the ore to be spread beneath them, at the same time equalizing the splash and discharge through the screens. It will be observed that five is the least number of stamps which can be so arranged. These required conditions are met in the first rotation stated, while they are not in the second, where No. 3 stamp follows No. 4 in its drop, whereby the pulp is violently splashed against the screen instead of being partially spread beneath No. 4. This concentrated splash causes excessive wear upon the screen opposite No. 3 stamp, rapidly enlarging the holes, and allowing pulp and gold too coarse for close amalgamation to escape from the battery before the rest of the screen begins to show signs of wear.

The apparent intention of this second system of rotation is to work the ore from the ends of the mortar toward the center; but in practice it will be found that No. 4 will generally begin to pound the die before any other stamp in the battery, for the reasons above stated. These remarks do not apply to a 2-stamp battery, where, although the drop of one stamp necessarily follows that of its neighbor, the latter is partially raised before the former drops.

It is usually necessary to give the end stamps from one-half to one inch more drop than the others to prevent the pulp from banking at the ends of the mortar. Consequently, the end stamps will soonest strike the cams, preventing the others from being run at the higher speed that their shorter drop would otherwise allow. The writer in his travels once came across a sort of picked-up 5-stamp mill, in which the end stamps were heavier than the rest, allowing the drop to be the same for all five, which worked very well, especially when high speed or fast drop was required. The plan might perhaps be adopted with advantage by stamp-mill manufacturers.

MINE SUPERINTENDENT.

Baker City, Or., Oct. 1st, '98.

FIG. 8.—A TRIPLE RIVETED JOINT, WITH STAY BOLTS.

with black centers. Last January President J. M. Allen of the Hartford Steam Boiler Inspection and Insurance Company, and Treasurer Barnum of the engine-building company referred to, arranged for a careful test of this kind to be carried out at their works at New Haven. An experimental boiler was then built and the test made on February 26, 1898.

The boiler that was tested is shown in the engraving

Great Mining Enterprises vs. Small Ones.

TO THE EDITOR:—No one is a greater admirer of great enterprises than myself. I love to see and contemplate the progress which advanced thoughts bring forth, but while there may be greatness and glory in building great battleships and the annihilation of a navy in an hour, yet there are things which may pass the point of general good so far that not only those in direct interest but the general public are placed at a disadvantage. Pursuits in which a vast body of people can become workers, and by their labors become independent and more useful, should be kept outside of the grand schemes of vast individual expansion which only aggregate capital is a power.

Of all pursuits gold and silver mining, for more reasons than one, should not be circumscribed by law, but by reason. It should be for the greatest good to the greatest number. As I throw my recollection back to the earlier days, not only in California but on the Comstock, I see the entire mining field with an industrious, prosperous and wide-awake people, who built up and were satisfied with their more moderate institutions, that gave general employment and prosperity to their respective communities; but as larger ones took their place the advantages of labor and the communities' prosperity branched in proportion. There are two factors that come in for making this more especially apply to old and silver mining. One is the greater economy observed and a higher per cent of values obtained.

As illustrative of my idea I will take the State of Nevada and the Comstock. Having built the first mill for working its ores, and having invented the process for their cheap and practical extraction, and having worked for years upon the lode, it must be conceded that I have had a great interest in it and the State of Nevada.

The Comstock was a great field; it expanded the minds of mining men more than all the mining enterprises of the age. But this was the period of smaller operations, and when the multitude lent their thoughts and energies more for legitimate mining than speculation.

In later years there was a marked change. An aggregation of interests and speculation caused vast bodies of ore to be extracted, which were rushed to the mills, that gave not over 70 per cent of the value in the average—and all for speculation, in the interest of the few and to the detriment of the many. The result of this great onslaught on a mine which should have lasted years, to the good of a large population by moving on a more moderate and legitimate scale, and receiving of its value from 85 to 90 per cent, was that the end soon came, and vast sums have already been expended in seeking other ore bodies, and in trying to drain a vast area of mining ground.

There is now proposed a greater combination, a company of all the twenty-seven companies, a grand organization for the few to control and the many to pay the bills. This Comstock combination, reaching as it does from Cedar hill to and including the Juscelino on the south, is a gigantic affair, both in its conception and for possible expense. As before expressed, I love grand operations. I would like to see the pumping machinery for keeping this vast area of ground dry, and the other mining appliances for penetrating the Comstock 5000 feet, and to examine the vein structure at this depth. But the question comes, in view of the large profitless expenditure as made in the combination shaft, will it pay? This is the all-important question. The next to consider is, would not one-half the amount of money that it will require to raise the valueless material alone, scattered over the many, many ranges of Nevada, produce 100 per cent more benefit to the investor, the multitude and the State? And this is the question in a nutshell. The Comstock has had its day of glory. Its career for profit to the multitude is ended; not that there may not be other ore bodies in the extreme depths; not that the skill of man cannot overcome every difficulty in attaining these depths, but the question still looms up, will it pay to go further?

When I first visited and examined the Comstock I saw a mountain range covered with sagebrush and rocks. I saw occasional outcroppings of a lode that reached from Cedar hill to below Silver City. I saw that some parts of these croppings were rich and some were poor. I saw a locality as dry and forlorn in general appearance as it was possible to have any mountain range. Even water was very scarce.

In the State of Nevada there are to-day many just such places, with just such looking lodes coursing the ranges; and may they not be other Comstocks? What made the Comstock? I will answer: DEVELOPMENT. The Comstock when I first saw it had not an opening 25 feet deep in its entire length, but it had at the Ophir some very rich croppings. At Gold Hill, nearly a mile away, some more rich rock was to be seen, and at Silver City it was said the Brosch Bros. had found some good ore, but at no other point were there any rich croppings until development showed it. And thus was the begin-

ning; but the little rich ore started the few, and the few started the many, and the many started the development, and the development brought forth the wealth, and the great wealth magnetized the multitude, and we held to it long after it gave no value received for the capital and energy expended. And now the serious question comes up again, shall we continue to cling to the "what has been" and barren present, or shall we seek to develop other Comstocks in the same State with the money it would take to unwear the lode as it is to-day? There is one idea that wants to be obliterated, and that is that the Comstock locality represents all the mineral wealth of the State, for it certainly does not. All Nevada is virtually a mineral area with development, comparatively. There are any number of mines that, had they one-tenth the money and energy bestowed upon them that has been wasted on the Comstock of late years, merely to keep up a speculation for the benefit of the few, and a misdirected stock board, would have possibly produced other Comstocks; and this scattered development is what the State of Nevada now wants, is worthy of and should have, and must have to multiply its population and maintain itself as a State.

It is the smaller streams of wealth that build up a State in population and prosperity, and no State has a greater reward for judicious ventures, if the mining public will be content with the smaller operations, whereby the many are benefited, and not the few at the expense of the many.

Let the evils of the Comstock go with its past record, but let the future free itself of them, for they were the great curse of the entire mining industry.

ALMARIN B. PAUL.

San Francisco, Sept. 27th, '98.

Welding of Metals.

F. V. McMULLIN.

There are two methods by which metals may be united, viz., fusion and welding; and it is a difficult matter to decide which is the more useful in the mechanical arts. For, important as is the method of fusion, commonly termed casting, which enables us to unite a large number of small pieces to form a large one, it is still doubtful whether it is of more utility than the method of welding.

In the manufacture of machinery dangerous sections are now made as far as possible of metal capable of being welded, as less time is consumed in repairing them than in casting new parts; and time is a valuable factor in all repair work. Not only is time saved in repairing a break itself, but in machining the piece only a few inches on each side of the weld are distorted, while in a casting the greater part must be worked upon. Our railroads, for instance, if unable to weld broken locomotive frames, would have their repair bills largely increased by having to replace the broken frames with new ones. This fact more than any other prevents the general introduction of cast steel for this use, and is an instance of the inferiority of the cast products.

As ordinarily understood, welding is only done with ferrous metals; and while this is by far the most important application, it is a somewhat narrow conception of the process. When the dentist fills our teeth with gold, the small particles are welded to form one solid piece. All metals in a state of powder can be welded by pressure without heat. When two pieces of glass are joined, as in attaching a handle to a pitcher, it is an example of welding. These cases are examples of welding in its strictest sense.

The welding which the engineer concerns himself with, however, is the uniting of metal by hammering or pressure while in a plastic state produced by heat. We know that most metals are unweldable, and the question of why this is so immediately presents itself.

Welding has to be done while the metal is in a plastic condition—that is, when it is passing from the solid to the liquid state. Now, most metals do this very quickly, being plastic so short a time that welding in the ordinary way is impossible. That they are weldable has been shown in the past few years by the process of electric welding. To show what is meant by rapid change from solid to liquid, we can compare the behavior of wrought iron and copper when placed in an ordinary forge. The iron gradually loses its outline on becoming hot, and finally melts off drop by drop. On the other hand, the copper loses its shape almost instantly upon attaining a certain temperature. This behavior is typical of all non-weldable metals, that is, their plastic condition extends over too short a range of temperature to permit them to be joined in the usual way. High-carbon steel behaves in a similar manner.

We thus see that for ordinary methods of welding iron is the only metal that fulfills the requirements of the process, as platinum may be disregarded on account of its scarcity. Still, with iron the ordinary weld is partly an amalgamation of the surface and partly a soldering together of the pieces by means of the slag. In proportion as there is more amalgamation and less soldering will the weld be efficient. Complete contact of the two surfaces is practically impossible.

The requirements for a good weld are as follows:

(1) Sufficient heat; (2) protection of metal by a flux; (3) scarfing in such a manner that the flux can escape under the action of the hammer. In the heating enough of the metal must be melted so that the fibers may interlace with those of the other piece. This heating should be done in a reducing flame, as the heat necessary to raise the metal to the required temperature is also sufficient to oxidize it, if oxygen is present. To get this flame in an ordinary forge, the bottom of the forge must be covered with a sufficient depth of coke, so that the air in passing through loses its oxygen, which combines with the carbon of the coke to form CO_2 . It is also necessary to keep the iron well covered, so as to exclude surrounding air, leaving only vent for the blast, which might otherwise be shut off completely. If we have too thin a layer of coals the blast will not be sufficiently oxidized, and a heavy coating of oxide will be found on the iron. Even if there is but a small hole in the bed this will happen, and in this case in the form of a hole in the iron. An oxide thus formed, unless subsequently removed, prevents an even heating of the iron, as it is a very poor conductor of heat. The same general methods of forge heating apply to furnace work.

Welding necessitates the use of a flux, but with most wrought iron there is enough silicon and other impurities present to form it without any addition. The common error in supposing that wrought iron needs no flux is therefore plain. The purpose of a flux is to keep the air from the metals, thereby preventing oxidation, and it also has the effect of raising the melting point of the metal, since a certain amount of heat is absorbed in keeping the flux running freely. The oxide of the metal is removed by means of the flux, which in the case of steel, iron and, in fact, any metal, would prevent welding. Copper is welded by using a flux that contains a fusible compound of the oxide of copper. This flux acts precisely as does an iron flux, as it keeps the slag soft and allows it to fall off under the blows of the hammer. In iron work something must be used which will stand the high heat to which we raise the iron without being volatilized. Sand and clay are good examples, and borax is commonly used for steel, as sand has too high a melting temperature. Copper can be fluxed with a compound of phosphate of soda and boric acid. Softer metals, like lead and zinc, termed unweldable, are fluxed by resin or tallow. In many cases it will be found that the difference between a good and a poor weld is the difference in the scarfing. The principles of scarfing can be illustrated by the three ways in which two straight pieces are welded together:

1. *The Butt Scarf.*—This form of welding consists simply of putting the ends of the pieces in contact and driving them together at a welding heat. This is a poor form of scarf, since if the ends are square they hold all the slag, preventing good contact of the surfaces. If the ends are convex the slag works out, but in reducing bars to the original sizes the slag is worked into the metal on the edge of the weld.

2. *The V Scarf.*—This is made by cutting the ends of the pieces so that they fit together in the form of a V. In this weld it is a very hard matter to work the slag out of the notch of the V. It is used where it is necessary to fasten the pieces together before heating, as in welding steel points into tools.

3. *The Lap Scarf* is the most common form, and undoubtedly the most efficient, as the slag is easily worked out of it. These forms of scarfs are the principal ones, and all others are combinations of them.

In order to weld metal we must use force. Two kinds are available—impact, or plain hammering, and pressure. The former, for ordinary work, is the best, as the inertia of the pieces is not sufficient to absorb the energy of the hammer blow, thus leaving it to be expended on the welding surfaces. Also the sharp impact of the hammer splashes the flux from between the pieces, making a better contact. Pressure welding includes rolling as well as direct pressure. This solders the pieces together by means of the molten slag instead of amalgamating them. The roll is unable to squeeze out the slag effectively, and, as it lacks the splashing action of a hammer, a large percentage remains in the joint. Perhaps the most serious objection to press welding is the flow of metal, which we do not meet with under a hammer, and which some claim is a great advantage. In the case of a bloom, where the piece is hot uniformly, the entire mass is brought under the action of the press. This is undoubtedly true, but where the piece is partly hot and partly cold the best results are obtained with the hammer.

Electric welding has of late come into extensive use, and possesses the advantage of saving time consumed by common methods in taking the iron from the fire. The actual welding takes place at the instant the metal softens, so that, no matter how short the range of temperature during which the metal is plastic, there is no difficulty in welding. By this method so-called non-weldable metals are welded with perfect facility. For this method only an alternating current can be used, as the direct current causes electrolysis in the weld, owing to impurity in the metal, thereby giving a non-homogeneous and consequently a poor weld. It follows that an

alternating current is therefore essential to a good weld, because in all pressure welding there is no means of driving out the slag. It was claimed by the promoters of this process that no knowledge of metal working was required in order to do successful welding; but only a short time served to show the fallacy of this assertion. The many failures which followed were due, almost without exception, to the uncleanness of the welding surfaces.

When two pieces of metal are accurately fitted together, a very slight movement will sometimes cause them to be as solidly welded as could be possibly done by any method. This occurs generally between such dissimilar metals as a cast wheel and wrought shaft. In dismantling old engines the fly-wheel will sometimes be found to be cold-welded to the shaft. An interesting case of cold welding occurred at the Washington Navy Yard a few years ago, in which a workman placed a breech pin in one of the large guns then under construction. Although the pin was put in with no force other than his hand, it was welded so tightly that a red heat failed to loosen it.

Improvements in Gold Extraction.

Dr. Loevy, the new President of the Chemical and Metallurgical Society of South Africa, on the occasion of his inaugural address at Johannesburg, South Africa, Aug. 22, said:

"One of the first things to which the attention of the chemists on these fields was directed when the cyanide process was started on a commercial scale about seven years ago was the atom of oxygen in Elsner's formula showing the solubility of gold by cyanide. Many hopes were founded on this oxygen atom, which opened a wide field to experimenting and research work. I think there is hardly any oxidizing agent which was not experimented with in the beginning of this decennary, and many a member present here to-night was, like myself, enthusiastic over the splendid results obtained in the laboratory with potassium permanganate, peroxide of hydrogen, ferri cyanide of potassium and other chemicals. Rarely has the great difference between laboratory experiments and commercial working been so conclusively shown as in this case. We know to-day that oxygen is indeed an important item in the gold extraction by cyanide, but we also know that the oxidizing agents available, including even Mr. Sulman's bromo cyanide, cannot—chiefly for economical reasons—successfully be applied on a large scale. The experience of the last four years has shown us that the only available natural source to be taken into consideration for supplying oxygen to our working solutions is the air and that the success merely depends on the manner in which such supplying is effected. Our society and the industry are greatly indebted to Messrs. Caldecott, Durant and Crosse, who by their work and valuable papers read before this society during the last year have done a great deal towards the solution of this question. I might here add that, as you know, also in Europe many experiments have been made with oxidizing agents in cyanide solutions, which, of course, although apparently successful in the laboratory, are of no practical importance.

It might further interest you to hear that Bodlaender, who has lately devoted much time to the study of the cyanide process from a scientific point of view, is of opinion that Elsner's formula does not actually illustrate the reaction which takes place in the solution of gold by cyanide. He maintains that in the first place peroxide of hydrogen is formed according to the following equation:

and that the peroxide of hydrogen thus formed acts upon another part of the gold not yet dissolved in the first reaction according to the equation

a theory which seems to me very acceptable.

Speaking on the eventual possible improvements of the cyanide process, I unhesitatingly give it as my opinion that we have arrived at the top as far as the chemical part of the process regarding the solution of gold by cyanide is concerned, and that any improvements which in this part possibly can and, I am sure, are going to be made, will be of a mechanical nature. The precipitation of the gold, however, from a cyanide solution has, in my opinion, not yet reached the highest state of development, and I think that even in the electrical precipitation, as now in use, we will see considerable change and improvements within the next few years.

There is, however, one thing which has at various times been discussed at our meetings, and to which I shall like again to draw your attention, and that is the influence of the temperature in the solution of gold by cyanide. I am of opinion that this question deserves considerably more attention than has hitherto been paid to it, and that the temperature of the solution plays a much more important role than one generally realizes. I would refer to a statement

which I made before this society some years ago, which was confirmed by several members, that in treating pyritic ore containing about four ounces of gold per ton with a solution of cyanide of 40 degrees celsius the extraction obtained after four hours' leaching was 14 per cent higher than that obtained by leaching the same ore with a solution of the same strength for fifty hours in the cold.

I have little doubt that there is a great difference in the extraction in summer and winter, and think it would be very interesting to get reliable data on this point. Possibly in many cases where a low extraction cannot be accounted for, it might be brought home to the influence of cold weather. As to the practical application of heat in the leaching process I do not consider myself competent to give an opinion as to its possibility; it is for the practical engineer to find out whether such application is possible on a commercial basis. I content myself with stating the fact that a temperature of 35 degrees to 40 degrees celsius both accelerates and increases the solution of gold, and, without wishing to place too much importance on the result of some laboratory experiments, I think I am justified in expressing the opinion that should the application of heat in the leaching process be made possible on a large scale, that would possibly mean an increase of 1 dwt. on the total extraction from tailings assaying 6 dwts. The treatment of concentrates by cyanide would, in addition, be improved both by decreasing the time of leaching and increasing the solution of the gold.

Crushing Rolls.

The accompanying cuts present the end and side views of a form of crushing rolls, for use in concentrating and cyanide plants, as built from designs and

CRUSHING ROLLS—END VIEW.

CRUSHING ROLLS—SIDE VIEW.

patterns of the Joshua Hendy Machine Works of San Francisco. These rolls are driven by a pulley fitted to each roll shaft, which method permits of great speed and crushing capacity. The adjustable roll is mounted on a swinging arm pivoted at the bottom; its top being held in place by a heavy tension rod on each side, fitted with heavy steel spiral springs and adjusting nuts. The journal boxes are of the ball-and-socket form, which precludes any unequal strain upon the bearings—an important feature in their design and construction. Each roll shaft carries a taper center, upon which are secured the shells made of chilled cast iron or cast or forged steel. The feed hoppers are lined with white iron

plates which can be easily replaced at small cost.

The capacities of crushing rolls depend upon their size, speeds, character of the ore and fineness to which it is to be crushed. When fine crushing is necessary, two sets are generally used. These rolls are built of the sizes and approximate capacities as set forth below:

TABLE OF DIMENSIONS.—BELT-DRIVEN ROLLS.

| Size of rolls. | Size of main driving pulley. | Size of small driving pulley. | Revolutions. | Weight. | Capacity in tons per hour. |
|----------------|------------------------------|-------------------------------|--------------|---------|----------------------------|
| 10x16 | 48 in. x 8 in. | 24 in. x 6 in. | 150 | 4,500 | 2 |
| 12x20 | 60 in. x 10 in. | 30 in. x 6 in. | 130 | 6,500 | 3 |
| 14x27 | 80 in. x 12 in. | 40 in. x 8 in. | 110 | 12,500 | 5 |
| 16x36 | 96 in. x 12 in. | 48 in. x 8 in. | 85 | 18,000 | 8 |

A New Incandescent Filament for Electric Lights.

What is perhaps the most important new topic in the science of illumination is an improved incandescent filament for electric lamps from osmium, one of the rare metals, which, besides being the densest of all metals, is the most refractory, being infusible at any except the highest attainable temperatures. Osmium is found native as an alloy in certain ores of platinum and iridium. It is a hard, bluish-gray metal, with an atomic weight of 191.1, and the enormous specific gravity of 22.477, the heaviest substance known. Its tetroxide has a strong odor of chlorine, from which circumstance its name was originally derived. The MINING AND SCIENTIFIC PRESS of August 6th, '98, described this rare metal, which is of commercial value, and worthy of search for by

northern California miners. Osmidium finds ready sale at the Selby Co.'s office in San Francisco. The property which must have suggested osmium as the material of the new electrical filament was its practical infusibility, its known resistance to temperature in which platinum and iridium volatilize and disappear. It is well known that the intensity of light emitted by an incandescent substance increases rapidly with its absolute temperature. By heating osmium in a vacuum with an electrical current strong enough to volatilize platinum, it attains a luminosity hitherto almost unknown, emitting a white light of agreeable quality and color, but of great intensity.

So far as can be inferred from what has been published, the experiments go beyond the employment of a naked osmium filament, and include coating the metal with a refractory oxide like thorium.

It has long been known that a platinum wire or filament, through which a sufficiently strong current is passed, attains a white heat and then suddenly melts. If, however, the filament be coated with a highly refractory oxide like thorium, the temperature required to melt it is greatly increased, for the reason that part of the electrical energy is withdrawn from the metal to its oxide coating and is radiated in the forms of light and heat. Precisely the same result happens when the filament coated with oxide is of osmium, instead of platinum, and the resistance of the filament is still further increased to the extent that osmium is in itself more infusible than platinum.

There is thus obtained a filament capable of sustaining a temperature and consequent intensity of illumination hitherto unachieved by such means, and it is this which forms the germ of the present invention. It has been noted in the experiments that osmium used for this purpose must be almost chemically pure, and that commercial forms of that rare and costly metal require, before using, to be cleansed as far as possible of all impurities except platinum, a small admixture of which renders the osmium more elastic without sensibly diminishing its infusibility. The whole effect of the invention, if practically

applied, will be to advance in an important degree the limit of electrical energy which may be used in incandescent lighting and thus reach a new standard of economy in the production of artificial light, which is cheapest at the intensity obtainable only at high temperatures.

ELECTRICITY is as old as life, as mysterious as death and as everlasting as eternity. It is as bright as the stars of heaven; it is as silent as the graves of men. It is as powerful as fate, as subtle as sympathy, as swift as thought, and it is developing as rapidly as belief in the necessity of retention of the Philippines.

Coast Industrial Notes.

—A railroad from Golconda to Tuscarora, Nev., is projected.

—The Dunsmuir mill will dispense with Chinese labor in and around the coal mines at Nainaimo, B. C.

—The shops of the Spokane Falls & Northern R. R. have been removed from Spokane, Wash., to Hilliard.

—The Los Angeles, Cal., Street Railway Co. has been formed to control the street railway system of that city.

—In '97 the Grays Harbor, Wash., Commercial Co. manufactured 40,586,260 shingles and 35,628 M. feet of lumber.

—There has been a generous fall of rain and snow in the mountains and valleys of California, giving great satisfaction.

—At Sanger, Cal., forty men weekly furnish two carloads of redwood for the American Lead Pencil Co. of New York.

—San Francisco's uncompleted city hall has cost to date \$5,677,208.54. The cornerstone was laid Feb. 22, '71, and it has been a good thing.

—The State Government of Hidalgo, Mexico, bought the Pachuca water works for \$250,000, payable in installments within ten years.

—Control of the Hawaiian Sugar Co. has passed from the Spreckels to a local syndicate of bankers and brokers. The transaction involved \$3,000,000.

—The largest single consignment of Alaska salt salmon received in San Francisco reached here last week. It consisted of 4000 barrels and was sold for \$32,000.

—Secretary of the Navy Long will award a contract for the building of the coast defense monitor Wyoming to the Union Iron Works of San Francisco for \$75,000.

—The Manufacturers' and Producers' Association favors the State Exposition of California products, to be held in Oakland, Cal., from Nov. 12th to Dec. 3rd.

—The Southern Pacific R. R. Co. will soon begin building in various parts of California twelve steel bridges, aggregating half a mile in length and costing \$300,000.

—The U. S. Treasury Department has raised the Everett, Wash., Reduction Works to the grade of a bonded smelter, which will henceforth do its own refining.

—The Canadian Pacific Railroad will establish a new transpacific line. The steamers Tartar and Athenian, of over 4500 tons, will run between Vancouver and Vladivostok.

—The Santa Fe Railroad will light its limited train running between Chicago and Los Angeles, Cal., 2245 miles, with electricity evolved from the friction of the car axles.

—The Bellingham Bay & British Columbia Railroad is to be extended into the Mount Baker mining region, probably with the ultimate intention of going on over the Cascades.

—Work has begun on the Utah & Pacific R. R., which, beginning at Salt Lake City, Utah, under the auspices of the Oregon Short Line, will ultimately connect with Los Angeles, Cal.

—The twentieth century battleship Ohio, to be built by the Union Iron Works at San Francisco, will be an improvement on the Wisconsin, now building at that company's works under Government plans.

—The Oregon Sugar Co.'s plant at La Grange, Oregon, started up this week. It is locally estimated that this year's crop will keep the factory busy day and night for three months, and that the product will be 30,000 tons of sugar.

—At Santa Cruz, Cal., the new powder works plant has begun operations. The daily output is now 6000 pounds. Enough orders for smokeless powder, at 80 cents per lb., have been received to keep the mills running day and night for two years.

—At Port Angeles, Wash., a bonus of \$15,000 has been raised for the Pittsburgh Glass Works to be located at that place. The Pittsburgh men agree to commence work inside of ninety days and must complete the works before demanding any of the bonus.

—"A mountain of Fuller's earth" has been discovered near Poso creek, in Kern county, Cal. A contract has been let by the Los Angeles men who are developing it to E. Salido to deliver fifteen tons. Heretofore its production has been limited to England.

—Surveyors are at work on a line from the eastern part of Washington through the Cascade mountains to connect with the Washington Central and Monte Christo roads into Everett. The statement has gained credence that the C., B. & Q. is interested in the enterprise.

—The Circuit Court has decided that the city of Santa Cruz, Cal., must pay \$306,000 and interest at 5 per cent for April 4th, '94, on bonds issued by the city for improvements. The bonds were placed in the hands of agents, who disposed of them to Eastern capitalists. Interest and costs increase the debt to nearly half a million dollars.

—Work in Santa Ana canyon for the Southern California Power Co. is about done. The wires have been strung through the city. It is intended to carry a current of 5000 volts and to deliver it in Los Angeles at a loss of 10 per cent. The one order for this wire was \$50,000. The cost of the insulators was over \$14,000. It is probable the wires will be in place and the machinery ready to turn on the current about Nov. 1st.

—The Gridley, Cal., Herald says that T. R. Fleming of Biggs is working up a plan to complete the ditch and irrigating outfit of the Feather River Canal Co. in Butte county. This company was organized in 1891, capitalized for \$1,000,000. Thirty thousand dollars have been spent on the ditch, and it is esti-

mated that \$15,000 more will be necessary to put water on the land. It is proposed to provide for irrigating but 4000 acres at present.

—The seals are being exterminated in northern waters. The Alaska Commercial Company's report shows that only twenty-eight British sealing vessels were in northern waters this year, and their aggregate catch was only 10,000 skins, against 50,000 in '95. The North American Commercial Company's catch this season is only 18,000 skins, against 100,000 for some previous years. The same falling off is noted in the Russian and Japanese rookeries. The Russian Sealskin Company, which has leased the Comandorski Island rookeries, has taken this year only 7000 skins, against 50,000 last year.

—Corporations are sometimes undecided about the advisability of advertising the dividends which they from time to time pay. It may be said that so long as they keep their own stockholders posted on their condition their duty has been discharged and it is, therefore, none of the public's business. This would seem to be a sound position, if the corporation did not derive its existence from the public and hence owe it a certain duty. Aside from this it is to the advantage of a corporation to advertise its affairs for the sake of sustaining its credit, if for nothing else. This enables it to conduct its affairs on a more economical basis and maintain an integrity before the public that cannot but be of great service and profit to it.

—The following letter was addressed by a manufacturer's agent in the City of Mexico to the National Association of Manufacturers: "It certainly does strike me as peculiar, the stand taken by American manufacturers toward opening trade relations with foreign countries or distant points. Without exception they seem ready to sell or give up their goods if the purchaser brandishes a club and takes them away by force; but as to dealing in any liberal manner, or endeavoring to conform to any system of doing business which is un-American, in order to properly introduce their varied products, seems to be against American manufacturers' policy. American manufacturers get up their junketing tours all over Latin America, with the purpose of studying needs of the countries, possibilities of augmenting their sales, finding new markets, etc. They return from these trips well satisfied with the universal courtesy, refinement, politeness they have experienced, and their notebooks filled with specially marked openings for this or that product which they manufacture, determined on their return to push the advantage. There it ends. On balancing their books at the end of the year the intended increase of exports is a great big nothing. The American is absolutely opposed to spending any money to have his employees or representatives learn the language, methods of doing business, packing, shipping or even seeing a sample (unless bought outright) of the goods he manufactures for augmenting his business with a foreign country. On inquiry for prices he will invariably quote 'terms net cash,' which is a byword all over Mexico and always read with a smile. In the meanwhile England, France and Germany send men out at much greater cost to stay two or three years and acquire necessary information as to the methods and requirements, protection of accounts, custom house and consular papers, and they take the cream of the trade. Americans are truly great business men in their own country, but failures outside. But the time is soon coming when an outside market must be found for over-productions, and the result will be the field thoroughly covered by their more diplomatic competitors and only to be won at many times present cost. Another thing which works seriously against American houses is the New York broker, who, getting an order for American machinery, finds out the prices and discounts for export of the various factories in that line, takes the cheapest, adds 5 to 10 per cent to price list, and pockets the entire thing, to the detriment of both seller and buyer. The latter, much dissatisfied, buys his next order on the other side. Agents of English and other foreign houses thoroughly protect their employers, and vice versa, so that, when a man has worked hard to build up a business for his house, the agency is not taken away to be given to some one else, without agreement on both sides."

New Books.

"Commercial Cuba," with eight maps, seven plans of cities, and forty full page illustrations; by William J. Clark, of the General Electric Company; with an introduction by E. Sherman Gould, M. Am. Soc. C. E.; one volume, large octavo, \$4.00; Charles Scribner's Sons, New York, publishers. The field for business enterprises which Cuba offers for U. S. capital gives this carefully prepared and authoritative work especial timeliness. Mr. Clark, who has been for many years at the head of the Railway Department of the General Electric Company, is recognized as a statistician of ability. The facts which he has packed into this book, the sources of his information being personal observation supplemented by official reports, give an exhaustive picture of the conditions and possibilities of every industry on the island, each town and each district being critically examined with a view to the outlook for American energy. The chapters deal with social and hygienic questions, legal procedure, political matters, public improvements, railways, both steam and electric, turnpikes and roads, harbor and dock facilities, telegraph, cable and telephone lines, contract labor, agriculture, mining and manufacturing in all of its branches, and a multitude of other subjects of interest to business men who are looking to Cuba as a field for investment or as a market for goods. The maps, plans and illustrations, together with the commercial directory of the island in the appendix, emphasize the encyclopedic and exhaustive character of the work.

Personal.

T. T. LANE is in San Francisco from Chihuahua, Mexico.

A. BUCKNER becomes Mgr. Sunshine mine, at Sunshine, Utah.

G. NORMAN becomes Supt. Alliance mine, Park City, Utah.

A. L. BEGIBIE is Supt. Mt. Pleasant mine, Grizzly Flats, Cal.

E. J. KENDALL becomes Supt. Three Star mine, Auburn, Cal.

G. SCHMITH, Supt. Nat. Con. mine, Redding, Cal., is in San Francisco.

GEO. BLAKE, Supt. Bell mine, Tuttletown, Cal., is in Seattle, Wash.

C. H. NAZRO has been appointed Supt. Sampson mine, Silverton, Colo.

O. ADAMS is Supt. Adams Quartz & Gravel M. Co., Nevada City, Cal.

C. JOHNSON, Mgr. Mt. Gaines mine, Horntos, Cal., is in San Francisco.

JOS. LADUE, the discredited Dawson dust king, has returned to New York.

D. B. GILLIS succeeds E. McCormick as Supt. Parrot mines, Butte, Mont.

R. D. SUTTON succeeds E. Hoffman as Supt. Galena mine, Fish Springs, Utah.

J. B. HASTINGS has been appointed Supt. Center Star mine, Rossland, B. C.

C. A. BROCKINGTON has resigned as Supt. Orleans M. Co., Grass Valley, Cal.

F. DULMAINE, owner Golden Treasure mine, Grass Valley, Cal., is in San Francisco.

M. B. HARRIMAN, managing owner Harriman mine, Sonora, Cal., is in San Francisco.

A. J. DOYLE, Supt. Alameda mine, Jamestown, Cal., has returned from San Francisco.

J. L. GREEN, Mgr. Gabilan mine, Hermosillo, Mexico, is on a business trip to New York city.

CLARENCE BERRY of Fresno, Cal., returned last week from the Klondike with \$125,000 in gold nuggets.

H. WILSON managing owner Chloride and Bailey mines, Dedrick, Cal., has returned to San Francisco.

O. O. HOWARD JR. has returned to San Francisco from a visit to the Mt. Shasta mine, near Shasta, Cal.

HUGH McDONNELL, San Francisco, who is developing a copper property at Stillwater, Cal., is in Chicago.

E. IMHAUS succeeds P. Berthon as Mgr. Grande Ronde M. Co. and the Flick Bar M. Co. at Baker City, Or.

PH. DEIDESHEIMER who has been examining mining properties at Jackson, Cal., has returned to San Francisco.

C. A. BROCKINGTON has resigned as Supt. Orleans mine, Grass Valley, Cal. He is succeeded by C. R. Corning.

J. EDWARDS, a mining man from Brooklyn, New York, arrived in San Francisco yesterday on his way to Mexico.

W. H. NEWELL of the Selby Smelting and Lead Co., has returned to San Francisco from El Dorado and Nevada counties, Cal.

WM. VAN SLOOTEN, who has been exploiting an extensive gravel property in Sierra county, Cal., is on his way to New York City.

W. MCQUEEN, Supt. Great Northern mine, Canyon City, Oregon, is attending a meeting of his company at Salt Lake City, Utah.

I. ROSENTHAL and D. McKAY of San Francisco have returned from a visit to their El Ubarbo mining properties at Torres, Sonora, Mexico.

J. F. PARKS, Supt. Kennedy mine, Jackson, Cal., who sustained serious injuries some months ago has sufficiently recovered to visit the mine.

DR. WM. B. PHILLIPS, Birmingham, Ala., assumed the editorship of the *American Manufacturer and Iron World*, Pittsburg, Pa., on the 1st inst.

G. KARTSCHOKI, Pres. Champion M. Co., Nevada City, Cal., and Vice Pres. of the Con. St. Gothard M. Co., Columbia Hill, Cal., has returned to the city from a visit to the mines.

DR. J. B. PORTER, teacher of mining and metallurgy, McGill University, Montreal, is making an extended trip through British Columbia in the study of its mining industries.

PROF. RADTH, who recently returned to the United States from the Broken Hill properties, New South Wales, after a brief sojourn in Salt Lake City, Utah, has gone to New York.

C. D. LANE arrived in San Francisco this week from the Ketzabue Sound country. He has placed a number of prospectors at various points in that section to carry on exploiting for a year.

CAPT. J. J. MCKINNON, formerly of the Northwest mounted police at Lake Bennett, has been appointed gold commissioner by the Canadian Government for the newly created Atlin Lake mining district, N. W. T.

MR. STEPHEN RICKARD, formerly connected with the Tombstone M. & M. Co., Arizona, the Anaconda Copper Co., Montana, and for ten years with the Argo smelter, Colorado, has opened in connection with Mr. Oscar J. Frost, formerly of the Argo smelter, Colorado, an assay office at Denver, Colo.

Recent California Mining Incorporations.

McKinley Spartan Co., Sonora; capital stock \$50,000; subscribed \$42,975; P. Miller, J. W. Empfield, W. B. Schuyler, J. W. V. Meseroll, E. L. Rehm.

The Homestake M. & M. Co.; capital stock, \$300,000, subscribed \$107,000; B. E. Schl, A. Johnson, A. Edlund, G. Olson.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

MOLD-BOARD ATTACHMENT FOR PLOWS.—Frank Borge and Joseph E. Clary, Newman, Cal. No. 611,349. Dated Sept. 27, 1898. This invention relates to a means for attaching mold-boards to plow standards so that they can be readily reversed. It consists essentially in forming or fixing upon the back of mold-board a slotted lug or projection which is adapted to pass through the lug of the standard and be locked thereto by a key passing through the slot, the projection being so placed with reference to the top and bottom of the mold-board and the latter so shaped that it can be reversed by simply reversing it and then again securing it in place.

FINGER RING TWINE CUTTER.—Jacob Crandall, Westport, Cal. No. 611,313. Dated Sept. 27, 1898. The object of this invention is to provide an attachment to a finger ring so that it can be worn by the user and by which he is enabled to readily cut twine and strings which are used for doing up packages. It is especially useful for those who are working in stores and who have to make up and tie packages and afterwards cut the string. The invention consists of a ring having a head projecting on one side with arms which form curved channels underneath and a V-shaped knife is fitted into the slot through this head so that its edges project into each of the channels and either side can be used by simply drawing the twine into one of the channels and against the edge of the cutter. Upon the part of the ring which comes inside of the hand are two curved lugs projecting each way and fitting against the fingers adjacent to the one wearing the ring. These act as braces and prevent the ring from turning when the pressure is brought upon the cutting blade.

CAN SOLDERING MACHINE.—Erik Manula, Astoria, Or. No. 611,330. Dated Sept. 27, 1898. This invention comprises an apparatus for continuously soldering and especially to solder the ends upon cans of all descriptions and of different lengths. It consists essentially in the employment of a spiral carrier so arranged with relation to the solder bath that the cans are caused to traverse from one end to the other with the angle to be soldered dipping into the melted solder of the bath. In conjunction with this is a device or devices by which a square can after being moved with one edge in the solder for a short distance will be turned over to bring another edge, and so on until all four edges have been soldered. At the end of the apparatus is a carrier upon which the can is delivered outside of the spiral and at the entering end is a similar feed device so that the cans can be passed continuously through the solder bath.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey, Strong & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR WEEK ENDING SEPTEMBER 27, 1898.

611,311.—HOISTING MACHINE—H. C. Behr, S. F.

611,373.—WRAPPING PAPER—Blackman, Cone & Neill, S. F.

611,349.—PLOWS—Borge & Clary, Newman, Cal.

611,370.—COOKING UTENSIL SUPPORTER—L. D. Craig, S. F.

611,313.—RING TWINE CUTTER—J. Crandall, Westport, Cal.

611,564.—SPOKE GRIP—J. M. Crump, South Prairie, Wash.

611,427.—HAME TUG FASTENER—S. B. Davis, Stockton, Cal.

611,487.—CHAIN PROPELLER—W. Dodge, Monterey, Cal.

611,407.—STEAM BOILER—P. F. Dunder, S. F.

611,409.—CARBON FILM—C. Gitcheil, S. F.

611,350.—GLOVE—H. Heath, S. F.

611,379.—TYPE WRITER—M. Higuchi, Sacramento, Cal.

611,593.—CLOSING SHOT HOLES IN SHIPS—I. MacDonald, S. F.

611,380.—CAN SOLDERING MACHINE—E. Manula, Astoria, Or.

611,399.—SCISSOR SHARPENER—J. S. Shaffer, Tuttletown, Cal.

611,339.—TIRE INFLATOR—C. A. Shoplough, S. F.

NOTE.—Plain and Certified Copies of U. S. and Foreign patents obtained by Dewey, Strong & Co., by mail or telegraphic order. American and Foreign patents secured, and general patent business transacted with perfect security, at reasonable rates. And in the shortest possible time.

Catalogues Received.

CATALOGUE No. 11, Hercules gas engine, S. F., 48 pp., embossed cover; finely illustrated treatise on gas, gasoline and oil engines; descriptions, testimonials, etc., with tables of friction of water in pipes, power transmission, etc., sent to any address on request by the Hercules Gas Engine Works, 405-407 Sansome St., San Francisco, Cal.

CATALOGUE No. 24, Fraser & Chalmers, Chicago, pp. 170; discussion of economy of high-pressure, multiple-expansion steam engine; description of Riedler pump valve, water wheel tables, tables for measurement of water, reports of results, testimonials, etc. Sent anywhere upon request by Fraser & Chalmers, Fulton and Union Sts., Chicago, Ill.

Recently Declared Mining Dividends.

South Swansea, Utah, \$7500; Oct. 4.

Swansea, Utah, \$5000; payable Oct. 10.

Grand Central, Utah, \$31,250; payable Oct. 10.

Silver King, Utah, \$37,500; payable Oct. 10.

"Softening" Water.

TO THE EDITOR:—What may be done to "soften" water which is strongly impregnated with lime?—E. B. B., Shermanton, Cal.

Answer by Prof. E. W. Hilgard of the University of California.—Since waters possessing an inconvenient degree of hardness are very common, owing to the almost universal prevalence of calcareous soils and geological deposits, it is of interest to have some simple means of doing away with this property, so as to render such waters more convenient for domestic uses. This is the more important, as in some cases the presence of a large proportion of magnesia tends to cause serious, even though only temporary, gastric disturbance with persons unused to such waters, whereby quite frequently an unfounded prejudice against the general health conditions of perfectly healthful localities is created.

When, as is most commonly the case, this hardness is due to the presence of large proportions of the carbonates of lime and magnesia, it can be recognized by the extent to which the water becomes turbid, or forms whitish scum or incrustations, when boiled.

Boiling, then, is one of the means for softening waters that are hard and "curdle the soap" from this cause; but owing to the inconvenience of the application of this remedy, it is rarely resorted to except for drinking water. For this purpose, boiling has the special and additional advantage of insuring the destruction of any minute germs of disease that might contaminate the water.

The Use of Soda.—To soften water, a common and very good remedy is the use of carbonate of soda in sufficient quantity to bring down the lime and magnesia.

That it is undesirable to use soda for softening water to be used for drinking hardly needs more than mention. The natural hard waters usually contain quite as much of saline matters as is desirable in drinking water.

Soda, however, does not in any manner correct the sanitary condition of a water; on the contrary, it aids in keeping vegetable and animal matters in solution, and unless added in very large excess does not interfere with the vitality of fungous or other germs.

The Use of Lime.—By far the most convenient and effective mode of purifying larger quantities of hard water for domestic use, is the introduction of a definite amount of *quicklime*, proportioned to the requirements of each particular water; a point that can be readily ascertained by any one having an ordinary capacity for observation.

How Lime Acts.—The principle upon which this apparently paradoxical process is based is this: The lime and magnesia in hard waters are contained in the form of carbonates, dissolved in the water by the aid of free carbonic acid. Whatever drives off or takes possession of this free acid will bring down the earthy substances in an insoluble form, and thereon depends the efficacy of boiling as well as of the addition of "washing soda" ("cooking soda" or bi-carbonate will not produce the effect.) Lime in the caustic condition (as lime water, or "milk-of-lime," freshly prepared) will most effectually take possession of any free carbonic acid, and will form with it the same insoluble compound that, when hard water is boiled, settles to the bottom or incrusts the boiler. Hence, when an amount of clear lime water, just sufficient to absorb all the carbonic acid in a water, is added to it, both the lime added, and the lime and magnesia originally contained, are brought down in the insoluble form, and the mineral contents of the water are diminished very materially, sometimes to less than one-half of the original amount. With the sediments thus brought down there also usually comes a large proportion of the vegetable or animal matters contained in the water; so that instead of perhaps becoming putrid in a tank serving for domestic supply, water so treated will remain clear and odorless for a long time, if

protected from insects, falling leaves, dust, etc.

Suggestions on the Use of Lime.—The only practical difficulty in carrying out this purification is the ascertainment of the proper proportion of lime or lime water to be used, so that the water shall neither retain too much of its original hardness nor acquire an unpleasant taste and astringent action from an excess of lime.

For the waters of wells, springs, and smaller streams, as well as catchment reservoirs, the best effect is produced by the addition of from one-tenth to one-twentieth of clear lime water.

One part by weight of pure, unslaked lime requires seven hundred parts of water for its solution; the above proportion corresponds to from five to eight grains of lime per gallon, or about three-quarters to one pound per thousand gallons.

In the practical working of this process, it is best to have, for small tanks up to one or two hundred gallons, a supply barrel in which clear lime water of full strength can always be kept on hand ready for use. A few pounds of lime, slaked into a creamy mass, may be put in the barrel, the sediment being stirred up from time to time as the clear water standing over it is replaced. Of course, in order to preserve the proper proportion, once determined, only clear water must be used, otherwise more lime than is called for will be introduced into the water. The lime-water barrel should be kept closely covered.

For Use in Steam Boilers.—For larger tanks it will be more convenient either to take a weighed amount of unslaked lime for each one thousand gallons, slack it into "milk-of-lime" and stir it in, or else to prepare a large quantity of "milk-of-lime" which, when thoroughly stirred, will for each measure (bucketful) contain a known amount of lime. This would be the best way to handle cases in which the feeding water of boilers requires to be corrected. The lime treatment is efficacious against the frothing produced in boilers by waters containing a large amount of vegetable matter.

The sediment that accumulates in tanks used for this treatment is usually of a sandy nature, and not readily stirred up; it therefore causes little inconvenience, and can be removed at leisure, from time to time, as it becomes too large.

Nickel and Cobalt.

Several former sources of nickel supply are almost mined out. Nevada is the latest source of supply of nickel and cobalt. By the use of magnesium, nickel is drawn into wire, rolled into plates, beaten, raised or welded.

Cobalt is used chiefly as an anode in plating and for some parts of scientific instruments. It does not whiten copper to the same extent as nickel. The oxides of copper are of value in coloring china, earthenware and glass, and form the basis of the pigment known as cobalt blue. The present-day tendency is to replace brass and electro-plate by white alloys, which have nickel for their basis. These alloys are known as silveroid, argentoid, navoline, nickeline, etc., but they are all varieties of German silver, mixed either with tin, lead, or cadmium, according to the requirements of the metal.

SOMETHING has been heard from time to time of a gigantic terrestrial globe, the largest representation of the earth's surface ever designed, that was to be one of the chief attractions of the Paris exhibition of 1900. The project was that of M. Elisee Reclus. It seems that the enthusiasm of M. Reclus for geographical science is not shared by any considerable number of persons who have money to spare. The consequence is that reluctantly the distinguished French savant has had to announce that he abandons the idea on account of the financial difficulties of the project.

A GOOD average is generally a creditable performance; but too tight at one end, and too slack at the other, will not do for a machine fit.

Is Darwinism True?

W. S. PROSSER.

NUMBER VII.

As to the alleged correspondence of the embryo with the early animal forms, as invertebrate, then fish, etc., it simply amounts to this: that embryos, like everything else, must have a beginning, and grow from simple to complex. It is not conceivable how they could begin as other than invertebrate; or how the heart could begin except with one cavity, or how it would be possible to increase that number except by dividing the one and making two, and so on. Instead of a far-fetched and unreal connection with fishes, snakes, tadpoles, monkeys, etc., the human embryo simply exhibits a mode of growth proper and the best under the circumstances.

The argument from "vestigial remains," if it proves anything, proves too much. The vermiform appendix is said to be large in the human embryo, because it is a remainder from our "mammalian ancestors." Most mammals have one large blind caecum, as the horse, ruminants, etc. But man's ancestry cannot run through both horse and monkey, and Darwinists say it runs through neither. The two lines were at the Eocene and before widely separate. Birds and some early mammals had two such caeca. The human caecum, if ancestral, ought to be double or ought to resemble lemurs, which, according to Darwinism, were, of all forms they knew, nearest our ancestry. Instead, it is single and is at first large, as in horses, and afterwards becomes "spirally twisted," as in most carnivora; yet neither horses nor carnivora are in the line of ancestry. Such is Darwinian logic. If the human caecum remains merely because it was used millions of years ago, merely because it is "indelible" and cannot be dropped, then, by equality of reasoning, every other device ever used in prior animal forms ought to be retained—the insect's four wings, six legs, 1000 eyes, the bee's sting, the alligator's scales, bird's beak, feathers, monkey's prehensile tail, the turtle's outside skeleton, etc. We are asked to believe that nature did, with great ease, drop these and thousands of other devices, but quite failed after a million years of straining effort to get rid of others hastily alleged to be useless. Is the human embryonic caecum useless? I would recall that the office of so large an organ as the spleen is very little understood. It may be cut out, and the man lives and can run better without it, but dies at about 40. If some early birds and mammals had two caeca, we must believe either that nature began with one, worked up to two, then dropped one, but, from some marvelous imbecility, could not, in the case of man, drop the other; or begun with complex two, simplified to one, and there stuck—could not get rid of it, even if useless.

It has been usual to suppose that monkeys are next to man, "primates," highest among animals. There is no greater authority than Wallace, who ranks monkeys below many of the higher animals and inclines to put the elephant first. The enormous gap between man and monkey does not depend on such comparative ranking, but is certainly emphasized by it.

The present theory possesses an elasticity that Darwinism does not. If an outside power controls the steps between species, by forcing in new devices, those steps can as well be long as short. Many in the past seem very long. When so many new ideas were to be introduced at one time, as in the making of many, it is not impossible, but very probable, that, as natural generation had been commonly used in these short steps for economy of labor, so it may have been dispensed with occasionally for the same reason. Man probably had a special creation, to avoid filling the long gap between him and the animals with undesirable forms.

Darwinists claim that the difference between human speech and the cries and other intercommunications of animals is one of degree, not of kind, and

that "no line can be drawn." On the contrary, it can be made plain that the two things differ in kind, and widely so; in the following particulars, among others: First.—Animal cries are fixed and invariable for each species. Human language is by arbitrary sounds. Many things have a thousand names in a thousand languages. Second.—Animals at birth know these cries as perfectly as ever after. Humans must learn them slowly. Third.—Animals have one sound for one feeling, as hunger. Humans, out of a few sounds—twenty to forty—construct infinite combinations, words and sentences. Fourth.—Animal sounds are, practically, only vowel sounds, while humans modify these by lips, tongue and teeth, and, hence: Fifth.—Men articulate, while animals do not. Sixth.—Men whisper, while animals do not. Seventh.—Animals express only feeling or immediate desire. Humans communicate past and future actions, hope, etc., entirely dissociated from present action. Eighth.—Human language is largely based on specific names for natural objects—something entirely unknown to animals. Even domestic animals never learn their own names; they associate vowel sounds with certain events, but never consonants. Ninth.—The use of the negative, reversing accompanying words, is unknown to animals.

Parrots have a sound-producing apparatus which is only slightly inferior to the human larynx. Darwinism must claim that this arose through long use, and, thereby, gradual improvement. As a fact, parrots (wild) have only a few harsh cries and make little use of the vocal cords and muscles. It is a striking example of unused natural capacity and defies Darwinian explanation.

(To be Continued.)

THE *Meteorologische Zeitschrift* contains a treatise by Dr. F. Maurer on the regular periodical repetition of cold and warm years. During certain intervals of time, extending as a rule to about fifteen years, there is a recognized change of warm and cold periods. The warm periods, Dr. Maurer says, do not simply include a series of summers of extraordinary warmth, but also a series of mild winters. Similarly, during the cycle of a cold period, not only are the winters more than ordinarily severe, but the summers are far below the average heat. Dr. Maurer affirms that we can predict with tolerable accuracy the time when the next cycle of warm periods will occur. It is due, he calculates, somewhere about the turning point between the two centuries; and he thinks it probable, from the data obtainable, that the early years of the next century will be distinguished by a series of hot, or, rather, extremely hot, summers and a series of exceptionally mild winters.

In Switzerland they have begun making phonographic clocks and watches. By merely pressing the button of the new timepiece, it pronounces the hour distinctly. The alarms call to the sleeper: "Six o'clock; get up." There are some which even add the words: "Now, don't go to sleep again." The form can be changed to suit the buyer, and make the warning more or less emphatic. The maker introduces into clocks and watches little slabs of vulcanized rubber, on which the desired words are traced in grooves corresponding to the hours and fractions of hours.

THE discovery of a new element—polonium—is announced. The fact that the salts of uranium had the property of emitting a radiation having properties similar to the X ray led to chemical investigation, and M. Curie has succeeded in isolating this body in the form of a sulphide. From a chemical point of view the new element resembles bismuth, but its radiating powers are said to be 400 times those of uranium.

THE largest tin plate establishment in the world is about to be moved from Wales to the United States. Importations of tin plate have declined from \$22,000,000 to \$4,000,000 last year.

Mining Summary.

ALASKA.

J. O. Carlisle, formerly of the Carlisle mine at Forbestown, Cal., who left San Francisco on May 15th, '98, for the Kotzebue Sound country, returned to San Francisco last Tuesday. Mr. Carlisle was one of a party of eight interested people. In an interview with the MINING AND SCIENTIFIC PRESS last Thursday, Mr. Carlisle said that they landed after thirty-two days voyage at St. Lawrence Island, Northwest cape, stayed three days, and the only indications they found of quartz was float which carried a little galena.

From there they went to Port Clarence, the Teller relander station, about 300 miles north of St. Lawrence. There they launched their small steamer. When inland about sixty miles they struck the base of high mountains—a rough, rocky range bearing no name so far as they could learn—where they prospected in a desultory manner for three days for a distance of thirty miles. The ground was frozen hard after getting down 12 inches. This was opposite Fish river, in Gullfin bay, probably thirty miles distant. One of the party, who had promised to show gold-bearing gravel and quartz ledges, was accompanied to Fish river over a sixteen-mile portage, but he failed to show what he had promised, though some gold was found there.

The party then abandoned this section, which has absolutely no timber in the Port Clarence country. The natives depend for fuel entirely upon driftwood. They returned to their ship at Port Clarence and continued on to Kotzebue. A day's journey out, they landed and prospected the bluffs amid dangerous climbing, no brush to cling to, advancing with the aid of a pick. Here they found a large ledge of white spar, but it carried no mineral.

They continued through the straits up to Cape Cruzenstein, a trip of about three days. There they boarded the launch and followed the low, flat shores off the mouth of Notark river, where there was nothing to prospect. Ships of over 5 feet draft cannot get within forty miles of the mouth of Kowark river, thirty miles above the Notark. They continued across the neck of Kotzebue to the east shore; they found some colors in the sands of the beach. These waters were shallow and are dangerous for inexperienced boatmen. The waters are treacherous and many men lost their outfits, some launches were wrecked and quite a few men were killed.

On the 19th of July they took their launch and three boats, with two months' provisions, and started for the Kowark river. They followed the Hotham inlet to the Selewick lake, where they entered the southeasterly mouth of the Kowark. This river has about fifteen mouths, only a few of which are large enough for a boat of 4-foot draft. The bars are shallow. They got up the river with the launch about 150 miles, where they divided into two parties, J. O. Carlisle and G. W. Price continuing up the river in a small boat to Fort Cosmos, about 160 miles. Here they met men returning from Pick and Monalok rivers with discouraging reports, and they consequently changed their route into the Cosmos creek in a range of mountains. They found gravel everywhere and flour gold in exceedingly small quantities. Some twenty miles up the creek, which they were obliged to make on foot, packing their supplies, they came into a canyon at the junction of two small streams where they found favorable bedrock. At places it was a slate bedrock, at others a diorite, and at one place they found serpentine. It was a locality in which a miner would expect a favorable place to find gold, but they found absolutely nothing. In these mountains they found not even black sand, much less a color of gold.

Upon their return to Fort Cosmos they met a second boat with seven men who had been up above Selby lake and about 170 miles above Cosmos. Selby lake shown on the maps is no longer in existence. It was broken last winter by ice gorges, whose marks are still plain. These seven men had found nothing after they left the main rivers and lost the black sand. From Cosmos they went down the Kowark to the mouth of the Ambler river, a distance of 60 miles, where they met over 100 men returning from up the Ambler river to its head, about 100 miles, who had prospected across the divide on the Notark and 15 miles beyond, and the only piece of gold they found was about half the size of a pin head.

They changed their course, returning to Kotzebue camp, 135 miles below the mouth of the Ambler, occupying three days in drifting down the stream. The Kotzebue camp is about 135 miles up the Kowark from Kotzebue sound, and about 135 miles below the mouth of the Ambler river.

They made a portage of 25 miles into a range of mountains to the south. Here they found a conglomerate formation of cemented gravel, in which the flour gold again appeared. This flour gold, which they found in several places, Mr. Carlisle thinks is simply a product of the gradual wear or decay of this conglomerated matter.

Mr. Carlisle on his return to Kotzebue sound met men who had been to the head of the Notark, the Kowark (a stream 600 miles long), the Selewick and the Buckland rivers. These rivers comprise the entire watershed of the Kotzebue sound country. The men whom he met thoroughly understood mining and made careful investigations all along their trips. Their whole year's work and their costly outfitting were absolutely fruitless. Everywhere the ice and frost are found after getting down 20 inches, and in some places that at first sight would be considered favorable the ice and frost begin on the very top, in the mosses that overlie it.

It is Mr. Carlisle's opinion that, ordinarily speaking, the country is such that if gold were found in quantities that would return \$100 a day per man in California, the same kind of

ground could not be worked there at a profit.

Mr. Carlisle estimates that from 1200 to 1500 men landed in Kotzebue Sound, at a cost of \$1000 per man. There are about 700 men camping up the river, who expect during the winter months to make the portage over Zane Pass from the head of Par river to the Keokuk, and from there make their way to the Yukon by the time the season opens next year. He is of the opinion that in this venture, because of the severity of the climate, and the difficulty of packing provisions, attended by many other hardships, many lives will be lost. Whilst these men have supplies for a year, most of them have no money, and rely upon finding gold to carry them along in their needs, which he thinks highly improbable; that next year the provisions will give out, and, unless the Government comes to their aid, there will be starvation and death without fail. He says this without fear of successful contradiction.

Reports from American creek are to the effect that for the season of 1898 has practically ended, the result being \$75,000 gold taken from the gravel banks of that creek. This came from 181 of the 200 claims on the creek. A few claims changed owners. In one case a miner sold a claim for \$1000 before representation. A few weeks later on seeing the gold shoveled into sluice boxes he paid \$10,000 for a third interest. The mines are easily reached from Eagle City, a new town on the Yukon.

The U. S. Navy Department has a report from Commander Seebree of the gunboat Wheeling, dated Orica, Sept. 9th, giving a general outline of the conditions at Valdez and Orica, in the neighborhood of the gold deposits on Copper river, with information valuable to miners because of its authentic and official character. The commander says that he found 500 people at Valdez on the 6th of September, about 300 of whom were keeping stores, restaurants, etc. There were about 200 returning miners, and they were coming back every day at the rate of from two to fifteen. About 3000 people went in over the glacier and up the Copper river, and there are probably about 1200 people now in the interior, many of whom are building log houses and arranging to stay in all winter.

In the interior provisions are plentiful. Men returning sell their outfits, so that provisions, clothing, etc., over the glaciers are selling at less than half what they cost. At Valdez about sixty-five of the returning miners were being fed by the Government. These men say they have no money. They are required to work about two hours a day on the government reservation. At the hotel kept by the agent of the Steam Whaling Co. about fifty men were being fed and lodged for 75 cents a day. Before the winter sets in from 200 to 500 miners were expected to return from the coast to the interior. Some of these have no money and are asking if the Government is about to send a ship to take them out. Miners are crossing the glaciers in from twelve to fifteen hours.

In conclusion, Commander Seebree says that possibly 50 per cent of the miners on the coast have no money. Judging by the prices of provisions at Valdez, and from information given by the miners, there are at Valdez and in the interior plenty of provisions for all the winter for all the miners in the Copper River country, so there is no danger of starvation.

U. S. Consul McCook sends a report from Dawson in which he says Dawson City now contains a shifting population numbering about 20,000. "Forty thousand prospectors have passed through here from the White and Chilkooot passes. Most of them had a year's provisions. Hundreds are going away daily, not being able to stay long on account of the cost of living. A dinner costs \$2.50, and breakfast and lunch \$1.50. Lodging is \$1.50 per night in a bunk, and a hotel charges \$6.50 for a bed per night. The price of property in the business locality is enormous. A lot of convenient size upon the main street cannot be had under \$40,000. Lots in a bog off Main street bring from \$5000 to \$10,000. To rent a log cabin costs \$200 per month. With the exception of the warehouses, the theaters, dance halls, saloons and gambling houses are about the only establishments which can afford these terms. Along the river, ground leased from the authorities brings \$10 per front foot per month. This, with the 10 per cent royalty charged on the gross output, yields a very large revenue. The prevailing price of labor is \$1 per hour, but there are so many idle hands waiting for employment that the supply exceeds the demand, and may bring the price down. Still, there is the greatest activity in the erection of large buildings and warehouses. Most of the prospectors who are coming to Dawson City leave for camps in United States territory, since, apart from the country in the immediate vicinity of Dawson, which has all been staked off, this is the most promising field. But even here, out of more than 5000 placer claims and 2000 bench claims, only 200 have thus far paid to work. A great many have not been prospected and will have to be given up to the Crown, because one condition of the grant is that every person having a claim must work it continuously for three months each year. Ninety days' labor, at \$10 a day, is a great deal to risk upon one claim, and a good many who cannot afford it will surrender them. The creek claims have been reduced in size from 500 to 250 feet. Estimates of last year's output range from \$8,000,000 to \$12,000,000. Work has been largely confined to Bonanza and Eureka creeks will be opened up next winter, as they promise good results. One cannot prospect in summer, as the pits which are dug then fill with water. It is by the merest chance that one may strike a rich claim. No poor man should sell out and come here. Organized companies with capital will do much better, as they can hire work much more cheaply than individuals."

Consul McCook further emphasizes the distress among the prospectors in and around

Dawson City, and strongly advises no one to join in the hunt for gold unless he has at least enough provisions to last over winter, and enough money in bank to take him home if he is unsuccessful. The Consul says he is appealed to daily by men who have no money and cannot get work.

ARIZONA.

At the Azurite Co.'s claims in Pima county a good supply of water has been obtained, which was wanting to make the mines a success. Enough water has been developed to supply a thirty-ton smelter.—The largest hoist shipped to northern Arizona is being erected at the McCabe mine in Yavapai county. It weighs 23,000 pounds and has a hoisting capacity of 2000 feet.

Arizona Kicker: The Old Dominion Copper M. & S. Co. at Tombstone resumed smelting last week after being closed down seventeen months.—At the Copper King mines at Barrett the company intend starting their smelter soon and turn out copper bullion.

Mojave County Miner: Five men are at work on the Maguire mine near Kingman, making a test of the property. H. J. Delamer holds the property under bond.—The Temple Bar Con. M. Co.'s hydraulic plant on the Colorado river will probably be ready to start up November 1st. The company has bought the interests of Redman and associates for \$15,000 cash.

Yuma Sentinel: Senator Dorsey has returned to New York with his Harrisburg mining enterprise. Work on the 40-stamp mill will begin at once. He expects also to have his Picacho property in operation within a few months.

CALIFORNIA.

Amador.

(Special Correspondence).—The Centennial mine at Plymouth has been bonded to Johnson & Gross of San Francisco. They have begun to unwater the shaft, which is 350 feet deep. They will sink an additional 200 feet. The property has a 20-foot ledge of fair grade free-milling ore.

The 10-stamp mill on the Pocahontas at Drytown is completed and will begin crushing ore so soon as the concentrators, now on the way, are in place. The Pocahontas shaft has reached 800 feet depth.

Plymouth, Oct. 3d, '98.
At the Argonaut the mill is running to its full capacity.—The Kennedy people are taking precautions against a further shortage of water. They have installed a steam hoist at the north shaft in addition to that at the south shaft, and in a few weeks will be equipped to run the entire property by steam.—The Anita mine continues development work. It is locally said that a depth of 1000 feet will be attained before any considerable crosscutting will be done.—The Zeila mill is crushing ore from the Oneida mine, but in the Zeila sinking and repairing continues.

Record: At Sutter Creek the Balio mine has started work after one week's shut down.—The Wildman mine is running twenty stamps.—It is reported that the Mahoney mill will start soon.—In cleaning out the shaft the Lincoln Co. has passed through some good rock. They now have on the dumps 200 tons, which Supt. Voorhies states will soon be crushed. They struck this rock at 230 feet depth.

Republican: At Jackson good rock is coming from the Oneida mine. The mill being erected will be 60-stamp; the shaft is being sunk to the 2000 level.—The Keystone mine of Amador City has not been idle during the scarcity of water; about thirty-five men are employed at the mine, twenty in the shaft.—Linus & Co., developers of the Klondike property at French Camp, have closed down, pending an extension of their lease.—Work continues at the Amelia mine. The 800-foot level will soon be reached.

Butte.

Fifty men at Powelton are repairing and cleaning out the Cherokee ditch. This canal has a capacity above 10,000 inches and is nearly forty miles long and supplies a number of mines with power.—Last week the hull of the Paris and Ditzler dredger was launched in Feather river near Oroville.—Work in the Magalla mine near Dogtown was resumed last week.

Calaveras.

Steam has been inaugurated at the Esperanza mine, Mokelumne Hill, and everything works well.—Last week a strike was made at the Big Bonanza mine near Angels at 200 feet of a 10-foot ledge of good rock.

H. Blood bonded the Baumhagger mine near San Andreas for \$40,000 to L. Meyers, representing the Drake M. Co. Work has begun on the property.—The old Gunter claim at Washington Ranch has been sold to Oakland people for \$3000.

El Dorado.

The Selby mine near Diamond Springs is being unwatered.—The Larkin mine has a new air compressor and will soon have five additional stamps.—The Greenstone mine at Shingle Springs has been unwatered and re-timbered.

Humboldt.

Bitumen is reported discovered in the southern part of the county, in Mattole valley, twelve miles from the coast. Petroleum has long been apparent in that locality.

Kern.

F. C. Rader has bonded the Pioneer, St. Michael and Garfield claims near Randsburg to Dennison & Campbell for \$5000 for one year and a tunnel to be run in that time 300 feet long.—The cleanup at the cyanide works was a gold brick worth \$1200, the result of 120 tons of tailings.—A good find has been made by Brady & Parsons of a ledge about 10 inches wide.

The Red Dog mill, Johannesburg, cleaned up \$3000 worth of bullion last week from 100 tons of Butte mine ore.—The Butte, Val Verde, and other claims, are shipping low-grade ore to Barstow.—The Johannesburg and Eureka mills have been running steadily.—In the

Stringer district the Napoleon and Winnie groups are working full time.—The Wedge continues sinking through good ore.—The Little Butte is taking out ore; the cleanup last week being \$700.

Mariposa.

The ore from the Alice lode near Mariposa crushed at the Yellowstone mill averaged \$12 a ton.

Merced.

It is locally reported that the Slate Quarry Co. at Hornitos will erect buildings to accommodate forty men to work the quarries this winter.—The Mt. Gaines mine has given a contract for 1100 cords of wood.

Mono.

The 20-stamp mill of the Standard M. Co. at Bodie was totally destroyed by fire on the 5th inst. The new cyanide plant and the offices adjoining were saved. It is supposed that the fire was due to spontaneous combustion. The insurance is about \$15,000.

Nevada.

(Special Correspondence).—At no time during the water famine of the past summer has Nevada county suffered to the extent of other mountain counties. In some cases operations had ceased in a measure, but the larger mills throughout the county have all been running. Electricity has, of course, been a factor in the power question. The recent snowfall in the mountains gives encouragement to gravel miners, many of whom have done considerable work all the summer, awaiting rains.

The Champion M. Co. at Nevada City have come upon good ore in their new workings of the Merrifield mine. The ore is of fair grade and carries a good percentage of sulphurets. The ore body is growing as work advances and it is fair to say that the company is coming into another of their proverbial rich finds.

The Consolidated St. Gothard M. Co., operating at Columbia Hill, composed principally of the larger holders in the Champion Co., are mining and mill building on their newly acquired property with a business system and mining method that show they are not novices in the work. The great body of low-grade ore in the St. Gothard will be a study, and every effort will be applied to make it a commercial success.

C. A. Brockington, for many years connected with the mining industries of Grass Valley, has resigned his position as Supt. of the Orleans M. Co., though retaining large holdings in the property. The mine has been making improvements in the power line within the last year, and since it has cut through the hardpan at 400 feet depth, upon which former companies abandoned work, developments have been encouraging. Since February last New York capital has been carrying on prospect work and still continues so under an option on a portion of the stock. C. R. Corning represents the New York interest.

At the Brunswick mine the new pumps work successfully and the straightening of 500 feet of the 900-foot shaft is receiving attention.

The power drill installed at the Malakoff mine of North Bloomfield makes good progress in the tunnel, though the rock is very hard. The drill is operated by an air compressor. The company hopes to progress more rapidly toward the channel with their new mode of operation.

Nevada City, Oct. 3d, '98.

The Adams Q. and Gravel M. Co. has secured the Banuerridge mine near Nevada City and is continuing the tunnel.

Martin & Treddinick in the New Eureka mine near Nevada City struck a ledge 2 feet thick.

Union: At the Milliken gravel mine near Nevada City, from which the pumps had been pulled for some unknown reason, work was resumed this week.

Placer.

Colfax Sentinel: The main tunnel at the Red Point gravel mine at Damascus is in 12,000 feet. Supt. Ferguson has sixty-five men on the roll; 130 cars of gravel per day is taken out. The power for running the blower is supplied by 40 inches of water from the mine. This water is conveyed from an upper tunnel and is taken up 4000 feet, giving a pressure at the mouth of the main tunnel of 90 feet. The gravel is free washing and the flow from the mine furnishes ample water.—Good progress is made on the tunnel of the Blue Canyon & D. Co., near Blue canyon. A machine is used and 23 feet was made last week. The tunnel is in 1050 feet. An installment of 1 cent per share is collected each month, giving \$400 per month for development work. There are 130 stockholders and assessments are paid promptly.

Herald: E. B. Quigle is prospecting the Ferrier gravel mine, near Todd's valley. His tunnel is in about 100 feet. He employs eight men.

San Bernardino.

Nearly a month ago J. J. Arbios started his stamp mill at Dale and has been working about four tons of rock a day. He is making a 200-ton run for Ellerman & St. Germin, the rock milling about \$18.

San Diego.

The Ramona Sentinel says that Bennett & Isham had their cleanup at the Helvetia mine at Julian recently and left for parts unknown with the bullion.—The Cincinnati Belle mine laid off quite a number of men, but will soon begin operations.

Shasta.

L. M. Ludovici has sold to O. H. Simons a half interest in the Snow Storm, Day Dawn and Golden Jubilee mines near Muletown.—R. P. Gibson has sold to S. Gibson the Big Digger placer mine near Redding.—Calvin & Blakeley bought from E. Holden five claims in the Stillwater mining district.

Searchlight: Davis & Sexton at Whiskeytown are building an arrastra to work the Flagstaff and Good Luck mines.—The Niagara mill, near French gulch, is running on leaser's

rock. Foley & McCurry have seventy tons of rich ore to be milled. The ore assays over \$500 a ton free milling.

Sierra.

The Oriental mine of Alleghany has men employed clearing away the debris preparatory to starting general work.—There are forty men working at the Mountain mine and the 40-stamp mill started last week.

Siskiyou.

The Yreka Journal says that the Schroeder quartz mines on Deadwood have been sold to a Chicago company for \$100,000, to be paid in four installments. The new company will increase the 10-stamp mill to 20 stamps.

Journal: The Hollister Co., working the old Spencer mine on Humboldt, now known as the Golden Star mine, find good prospects. The pump has been pulled and the tunnel is to be continued. The quartz yields from \$14 to \$18 a ton.—The company prospecting Yreka creek from Shasta river to Yreka will prospect the Butler and Burgess places near Yreka, and will soon complete testing all the ground along the creek in Yreka basin. The company has to the 20th of October to decide upon accepting the ground, and should it be accepted, extensive operations will immediately begin by the dredger system.—McCaw & Co. are getting good ore on Patterson creek.—Barton is at work in his river claim at Oak Bar.—There are more men employed than ever before along the river.

Reporter: At the Gum Boot quartz mine near Scott Bar, owned by Simon & Co. a ledge 4 feet wide was struck that will average \$30 a ton. This is the third ledge discovered in the mine.—Work at the Crocker & Bennett mine continues with success.—Nesbitt & Hunt of the Montezuma drift mine continue prospect work.—Thomas & Son have been working their drift mine at French Bar all summer and it has paid well.—The Quartz Hill mine remains idle pending litigation.

Trinity.

McDonald Bros., who recently bought the Bloss & McClary hydraulic property at Trinity Center, have bought an adjoining 155 acres with ditches and water rights from the Quong Sing Co.

At the Lappin mine, near Deadwood, six men are employed and the ore taken out is high grade. Next spring a 5-stamp mill will be built. Heretofore the ore has been crushed in an arrastra and has netted from \$150 to \$400 a ton. The property is owned by J. Tourtelotte & Co.

The Brown Bear mine at Deadwood has a good ledge 4 feet wide. A 3800-foot tunnel, which will take two years to complete, is soon to be started.

Tuolumne.

The Tuolumne G. M. Co. has entered suit at Washington, D. C., to break E. Duchow's timber patent to the placer mines at Springfield Flat.

Storms & Co. will place a steam hoist on the Agnes. The mine is reported looking good.—In the Grizzley they are drifting to connect with the old workings. The mill is waiting for water.

Magnet: The force at the Rawhide mine has been cut down to a minimum. The mill is closed down and the furnaces will cease operations until the rains set in. In the mean time overhauling the machinery will be carried on.—At the Black Oak mine, near Soulsbyville, the 20-stamp mill is being run by steam, the 10-inch Cornish pumps supplying the water for battery and other purposes from the mine.—Sinking has resumed in the Mazeppa. The new hoisting plant, a double engine of 48 H. P. and a 60 H. P. boiler is finished and with three eight-hour shifts the shaft will be pushed.—The Shawmut 40-stamp mill is running by steam power; it has a 100 H. P. engine and employs 160 men.

Democrat: The Hazel Dell mine near Soulsbyville is being operated under a bond by Moore & Co., who are driving a crosscut tunnel at 300 feet depth. The ore body is from 3 to 4 feet wide, and carries a heavy percentage of sulphurets.—The Duleep & Dewey mine in the Groveland district has a vein 8 feet wide. The property has been bonded to people who will soon begin work.—The Lumbo has a 3-foot ledge on which sinking is progressing.

Yuba.

J. C. White, by his attorney, has commenced suit against the Good Title M. Co. at Dobbin, a corporation, to recover \$3111.12, due on twenty different claims.

Near Brownsville Supt. Darwin is opening up a quartz mine. The rock looks fair.—The gravel mines near Strawberry are being worked by men from La Porte and Scales.—On the Mooreville ridge prospectors are opening up gravel claims.—The New York M. Co. have sixteen men building a ditch.

COLORADO.

CHAFFEE COUNTY.

The Belle of Granite mine, at Granite, which has been a producer for the last twenty years, shipped a carload of ore last week that runs \$80 in gold per ton.

C. F. Palmer is building a 60-ton concentrating and matting plant at Winfield.

CLARK COUNTY.

The strike made in the Perkins tunnel, Cascade district, at 700 feet is a vein 20 feet wide. The ore is streaked with seams of gray copper and runs high in gold values.

Two shipments from the Betsy Belle in Silver Creek returned 227 ounces silver and 32 per cent lead and 282 ounces silver and 34 per cent lead.—The Gold Anchor, near Yankee, is said to have struck \$300 ore.—The King Solomon shipped another carload of \$60 ore last week. This mine has been a producer since last April.

DOLORES COUNTY.

The ore shipments from Rico for the third week in September were sixteen carloads. The gain over the shipments from Jan. 1st to

Sept. 30th, '98, over the same period in '97 was 229 cars, the total shipment being 582 cars.

EL PASO COUNTY.

The Amazon Co. has leased the Providence at Victor to Colorado Springs people, who began work last week for two years for \$100,000.—The gross value of the ore taken from the Hull City placer since February last is given at \$400,432. The Independence Town Co. received in royalties during that period \$76,993. All the ore has been produced by lessees. The company is sinking a shaft and will work the ground after the expiration of the leases on the last of the year.—It is estimated that the gross value of the Cripple Creek output for September will not fall below that of August. The total tonnage for the month was 35,740 tons, with a bullion value of \$1,405,200. This is an increase of nearly \$100,000 over July. The cyanide and chlorination plants extracted \$669,200 in gold from 25,240 tons. The record of the different plants was as follows:

| Plants. | Tons. | Value. |
|-----------------------|-------|----------|
| Gillett | 2,600 | \$78,000 |
| Brodie | 1,840 | 55,200 |
| Arequa | 2,100 | 73,500 |
| Colorado-Philadelphia | 7,000 | 210,000 |
| Metallic | 8,000 | 160,000 |
| El Paso | 3,700 | 92,500 |

The tonnage treated at the smelters was 10,500 and the bullion value was \$735,000.

In the Moon-Anchor mine, Cripple Creek, drifts are being run in good ore at the 600 level. The output is forty tons per day of smelting ore which runs from \$70 to \$80 per ton.

GILPIN COUNTY.

In August there were 400 stamps dropping in the Black Hawk mills and seventy in Nevada. The greater part of the work was done on Gilpin county ore. Some company mills were added to the list in September. Considerable new ground is being opened.—Ore is being sacked at the East Notaway mine that carries 344 ounces of gold per ton, of which they have saved about three and one-half tons. They shipped last week four tons worth \$440 per ton.

HINSDALE COUNTY.

The Bon Homme mine in Burrow's park again shipped a carload of good ore. The property is well developed.—The test made on the new strike on Engineer mountain gave \$110 in gold and nine ounces in silver per ton. The vein is 10 inches wide and the ore can be taken out rapidly. A carload is being hoisted for shipment.

LAKE COUNTY.

Shipments from the Mahala mine, Leadville, have been increased from 50 to 100 tons daily.—The Resurrection mine continues its output of 150 tons daily and is working 110 men. This does not include the work and output from the company leases.

The placer company at Lake creek are placing two derricks that cost \$3000. They are running two giants and have ordered two more. They have 2000 feet of pipe laid and expect to put down as much more. They employ forty men, and next year will employ from 75 to 100 men, they have a large number of acres.

The Little Jonny mine is increasing the production of ore. The August output was over 7000 tons, but September shows 8000, with 460 men on the payroll. There are four shafts working in ore, while the No. 5 shaft is sinking.

Thirteen sets of lessees are operating the Lillian property on Printer Boy hill. The work is being done through a tunnel from which the entire development of 175 acres is carried on. Forty men are employed.

PITKIN COUNTY.

The underground electric railway between the Argonaut-Juniata and the Mollie Gibson shaft No. 2 at Aspen has been completed, and the output of the Argonaut-Juniata will be steadily increased. The property has been practically shut down during the construction of this railway, although the Argonaut-Juniata portion of the new joint mill has been kept in operation on dump ore. Hereafter the mill will operate on ore direct from the mine and will give employment to sixty miners.

SAGUACHE COUNTY.

Last week the ore shipments from Creede were 89 cars, or 1615 tons. For the month of September the shipments were 493 cars, or 8679 tons.—The Nelson tunnel is in nearly 500 feet on New York Chance ground, and is being driven at the rate of 250 feet a month.

SAN JUAN COUNTY.

C. C. Koennecker shipped from Silverton two carloads of ore from the Ridgway mine, which netted nearly \$5000.—The Sunnyside mine is making weekly two carload shipments.

SAN MIGUEL COUNTY.

The Tombay mine at Telluride is working between 200 and 300 men in mine and mill, and dividends of \$54,000 a month are being paid.

Twenty-seven cars of ore were shipped from Ophir last week.

The ore shipments from Ophir last week were twenty-seven carloads.

IDAHO.

(Special Correspondence).—Among some of the achievements of modern deep mining and drainage, the Helena-Frisco mine of this place offers an instance of some note. The mine has a tunnel that runs 600 feet below the surface, and from which a shaft has been sunk 1000 feet deep. At this depth a station is being cut for the purpose of placing a pump that will raise the water 1000 feet at a lift. The pump and machinery, together with the pipe, are all of unusual size and strength.

Gem, Oct. 1st, '98.
The new dredge of the Basic Co. at Placerville began operations last week and is working successfully.—The Mammoth M. Co. at Wallace has begun on its new tunnel and ex-

pects to continue until the lead is cut, which will be in 3500 feet. It will cut the vein 1800 feet below the surface and will be 1100 feet below any work that has yet been done in that neighborhood.

The Peacock mine, in Seven Devils, has a contract, running three years, with the American M. Co., for the extraction of 50,000 tons of ore, which will be smelted at the mine. A 50-ton smelter will be in Weiser within twenty days. Men were put at work on the Peacock last week.—Near Pine Grove a quartz mill is being erected by Supt. Tustin to reduce the ore from an old mine at Smoky.

The President mine made another carload shipment of gold ore to the Salt Lake smelter. The fifteen tons sent to Salt Lake two weeks ago yielded \$55 per ton.

The following is a synopsis of the report of the DeLamar M. Co. for August, '98. During the month 5120 tons were leached:

| | |
|--|----------|
| Bullion produced from cyanide treatment | \$34,875 |
| Cleanup | 2,085 |
| Estimated value of ore shipped to smelters | 550 |
| Miscellaneous revenue | 50 |

Total product.....\$37,560
Total expenses.....32,150

Profit for month.....\$ 5,410

In the United States Court of Appeals at San Francisco on the 3rd, in the case of the Tyler M. Co. against the Last Chance M. Co., it was ordered remanded to the lower court and judgment for damages modified. The present action was over certain amounts allowed for damages to the Last Chance M. Co., the Tyler Co. having filed a bond pending the hearing of an injunction suit to restrain the Last Chance from continuing work on the mine.

MICHIGAN.

"Never before in the history of Lake Superior copper mining," says a Houghton, Mich., dispatch, "has there been a time when so many men were employed, such large profits earned, and so much new work under way. On Sept. 1st, '94, a few over 6000 men were employed by the Houghton county mines. On Sept. 1 four years ago the market value of the Houghton county mines was approximately \$46,000,000, while at the present time it is almost exactly \$90,000,000, having practically doubled in four years. The population of the copper district is increasing by leaps and bounds, until Calumet, the most populous town, now has nearly 40,000 souls, making it the third largest mining camp in the world and the second largest in the United States."

MONTANA.

The report of the Anaconda Copper M. Co. for the year ending June 30th, '98, says: "During the year 124,417,471 pounds of fine copper were shipped from Anaconda in the form of electrolytic cathodes and converter bars. The shipments of silver, partly in bullion and partly in converter bars, amounted to about 5,300,000 fine ounces, and the shipments of gold aggregated 16,610 fine ounces. The sales in the same period amounted to 135,002,147 pounds of fine copper, 5,706,377 ounces of fine silver and 19,930 ounces of fine gold."

| | 1898. | 1897. | 1896. |
|----------------|--------------|--------------|--------------|
| Total receipts | \$22,387,104 | \$22,940,393 | \$16,945,697 |
| Expenses | 18,835,758 | 17,804,345 | 12,687,182 |
| Profit | \$ 3,551,346 | \$ 5,136,048 | \$ 4,258,515 |
| Dividends | 3,000,000 | 3,000,000 | 750,000 |
| Surplus | \$ 551,346 | \$ 2,136,048 | \$ 3,508,515 |

The Montana O. P. Co. are operating the Big Bonanza near Walkerville and some very rich silver ore is being taken out.—The buildings at the Burkley mine in Meaderville are nearly completed. Ore is being hoisted from the 200 level at the rate of 200 tons daily. Work is being pushed on the drift at the 400 level.—Near Missoula the Montana & Kentucky mine has passed to G. E. Boose. It is lead and silver, but owing to low prices no shipments have been made of late. Mr. Boose has started the concentrators and 1000 tons of ore now on the dump will be immediately reduced.—The Anaconda Co. will put in eight pumping engines, each having a capacity of 500 gallons per minute against a 600-foot head. The engines will be driven by compressed air, which will be heated before entering the cylinder and reheated between the cylinders.—The Montana Co. near Sheridan started their mill last week on a 50-ton test run.

The Intermountain hears that the Washoe Co. will soon open general offices in Butte and that they will put a large number of men to work on a property in that neighborhood. In connection with this the talk of building a large smelter has been resurrected.

Tribune: The silver smelter at Great Falls, which has not been in operation for two months, has started up again, and to an extent greater than for several years past, one furnace being operated that has not been fired since the great slump in silver. About 175 men are employed. The ore which has accumulated since work was suspended is large. The mines which the company is operating are producing well.

NEVADA.

Remodeling the Navajo mill, near Tuscarora, has been completed; and the old mill, which has turned out tons of silver bullion, began the first of the month on gold ore from the Eira.

At Cherry Creek the Eagan mine is in ore running \$60 to the ton in gold and \$110 in silver. Preparations have begun to build the new mill at the Starr mine. The camp generally is in a prosperous condition.—About 340 tons of ore from the Bounce mine at Douglas yielded \$19.10 per ton. They are down 350 feet and the ore is fair grade.

The price asked for the April Fool mine at De Lamar, Lincoln county, is \$500,000.—Machinery for a water jacket furnace has arrived for the copper properties near Mineral Hill. The mines are sold to California men,

who begin development at once. The furnace has a daily capacity of sixty tons.

NEW MEXICO.

J. W. Fleming, United States mine inspector for the Territory of New Mexico, has made his annual report for the year ending June 30, which shows the coal production to have been 858,583 tons, an increase of 125,044 tons over the previous year. There were seven fatal accidents.

OREGON.

(Special Correspondence).—The amount of gold found recently by two professional pocket hunters, Brown & Angle, on Sterling mountain near Coles is about \$9000. They report the ledge to be in a porphyry formation, the pay streak running 4 inches to 2 feet in width. The ledge has been uncovered about 150 feet, but no depth of any consequence has been reached. Whether there is anything in this find aside from the hand-mortal process of operation will be ascertained by future developments, which however, can not be carried to any great extent because of the winter storms that will soon make their appearance in that section, which is at an elevation of 7000 feet.

Medford, Oct. 2nd, '98.
(Special Correspondence).—A. J. Jackley has milled twenty tons of ore at the Union Companion mill here, and received \$750 in bullion and \$550 in sulphurets from an incline less than 20 feet deep.

Cornucopia, Oct. 1st, '98.

The Robbins mine, near Baker City, owned by Pennsylvania men, is being developed by drifting.—The Beaver M. Co., operating the Denny group, is employing twenty miners.—The E. & E. Co.'s properties at Bourne are being put in shape; new ore bodies are being uncovered.

The Gold Standard M. Co., near Jacksonville, have their mine in good order and began crushing quartz on the 4th inst. They have a large quantity of ore on the dump.—Operations have been resumed at the Sterling mine and the cleanup of last season's work will be completed.

SOUTH DAKOTA.

The annual report of the Homestake M. Co. for the year ended May 31st, '98, shows that during the year the company's three mills treated 548,390 tons of ore. The returns from this ore were bullion bars valued at \$2,483,375, of which \$2,467,998 was in gold and \$15,377 silver. From this there are to be deducted bullion charges amounting to \$12,866, leaving a net balance of \$2,470,519. The net proceeds of concentrates saved from the mill tailings was \$34,651, bringing the returns up to \$2,505,170, which gives an average of \$4.56 per ton. The expenses were \$1,855,790, or \$3.38 per ton, leaving a profit of \$651,380, or \$1.18 per ton, from which dividends amounting to \$500,000 were paid. The report of Supt. Grier says: "No greater depth has been attained than was reported four years ago. The older workings continue to furnish a large supply of the ore milled, while a goodly share is being drawn from the newer openings at greater depth. Preparing the new hoisting works for business progresses slowly. Several months will elapse before it is ready for the heavy traffic that it will be capable of. Everything at the mills, repair shops, hoisting works, etc., is in good condition and running smoothly. On May 1st the mine began furnishing ore to 140 additional stamps, making 540 in all, now dropping on Homestake ore."

The Hawkeye M. Co. has bought the six claims and mill of the Pluma Con. G. M. Co. at Lead for \$36,110.36 cash.—Supt. Dalby of the Big Four M. Co. has started work upon his company's property at Garden City.—E. May of Lead bought the Hulst & Price property, comprising three claims.

UTAH.

The new cyanide mill of the Star G. & S. M. Co. in Pine canyon, Tooele county, has started work. The mill will handle fifty tons of ore daily.—Work has begun on the Mercury mill at Mercur to enlarge its daily capacity to 400 tons.—At the Ophir Hill 1400 tons of concentrates were turned out in September from 4200 tons of ore. The mill will be closed during the winter.—The Midas mine is making a test of its ore at the Mercur mill. It has a ledge 3 feet thick which carries \$32 gold, and samples have been treated showing a recovery of 90 per cent.

At the Bullion-Beck, Eureka, shipments are not so extensive as they have been, because a great deal of drifting has been done since the shaft was extended to the 1300 level. Within a week, however, such dead work will be finished and the heavy shipments will be resumed.

At the Highland mine, Bingham, a crosscut has been put into the ore body 170 feet, and the hanging wall has not been reached. An upraise has been made from No. 6 to No. 5 tunnel, 106 feet, all in ore, showing the continuity of the vein to the apex.

On White river, near Vernal, gilsonite deposits are being worked by Collett and others. The product is sent by team to Fruita, Colo., whence it goes to Chicago or St. Louis. The output runs from ten to twenty tons per day.

The Victoria copper property was sold for \$65,000 to Massachusetts people, who are represented in Utah by J. F. Gates, and it is said that active work will soon begin.

The Park City Record says it is locally reported that the old Empire mine, comprising twelve claims, is about to be reopened by a Montana company.—Last week's ore shipments from Park City were 1,744,450 pounds.

Work at the Alliance has resumed. Three shifts were put on and will be kept at work all winter.—The new hoist at the Cumberland is in place and sinking has resumed.

WASHINGTON.

At Republic the electro-cyanide plant of the Republic Co. is saving a high percentage of the gold. The saving for August was 91 per cent.—The Blaine-Republic tunnel is in

960 feet and the rate of 10 feet per day is being maintained.—At Bossburg the Bonanza mine, which has been shipping from two to three cars of high-grade galena a day for a year, has developed a large body of ore at a depth of 475 feet. Heretofore no ore has been taken out below the 400 level.—At Meyers Falls the Silver Queen has been sold to a B. C. company for \$30,000. It has been developed by shafts and surface cuts.—C. D. Beach has made a strike in the Thistle claim near Cascade of high-grade copper ore which assays 24 per cent copper.

FOREIGN.

BRITISH COLUMBIA.

A welcome order has just been issued by F. J. Humes, Minister of Mines for British Columbia, to the effect that gold commissioners, mining recorders and their employees are barred from holding or dealing in mineral claims of any sort or for any purpose in British Columbia. The only condition upon which an exception will be allowed is in the case of mineral properties already owned by the officials to be affected by the new rule. A statement of all such holdings must be filed at once with the Minister. The officials affected by the new rule will not be allowed to hold miners' licenses except to protect the property they already had at the time the ruling went into effect. Gold commissioners in British Columbia in the future will not be allowed to act on the affairs of any company in which they or any of their employees hold shares.

A Silverton report says that work has started on the first concentrator up the Four Mile Creek—a 100-ton mill which is being erected for the Comstock mine.—From the Stewinwind mine, Fairview, 200 tons of ore has been put through the Tin Horn mill and the result is a gold brick worth \$750 and \$750 in the tailings.—American capitalists bought from Henry and others a copper property across the Inlet for \$20,000 and let a contract for a 300-foot tunnel.

The largest dividend payer in the Slovan is the Payne mine near Soodon. In 1896 a half interest in the Payne was bought for \$87,000 by the owners of the other half interest and since then it holds first place as a dividend payer. The mine is connected with the C. P. R. by a tramway, and with the K. & S. R. R. by a gravity tram 6000 feet long, with a vertical drop of 2500 feet; steel cable $\frac{1}{4}$ inch; load per car five tons; average time of descent eight minutes; 125 men are employed and sixty tons of ore are shipped daily. The average smelter returns give 105 ounces of silver and 55 per cent lead per ton.—At the Noble Five thirty men are employed and the owners are trying to recover themselves from the financial difficulties into which the large expenditure for the construction of the tramway and the mill plunged the mine.

At the Center Star, Rossland, within a week operations will be under way, with 100 men employed. A new shaft is to be sunk, three-compartment, with two skip ways and a man way. A gallow-frame the same as that building at the War Eagle will be erected and fitted with electrical hoisting apparatus.—The North Star Co., East Kootenay, will soon start up with a large force. Contracts have been made for 100 M. feet of lumber and a hoisting plant has been ordered.

"An increased percentage of copper and a slight increase in the silicious character of the ore are the only changes in the character of the Le Roi ore that have been demonstrated by increased depth," says N. Tregear, the superintendent of the property. "In the way of gold and silver values, they have been practically the same from the surface down to the 700-foot level. At this level, where at present are the deepest workings in ore, the silicious ores and the iron ores have given way to a solid body of clean smelting ore 28 feet wide. We are now working seven machines side by side on the 700-foot level, and the showing is unsurpassed anywhere in the mine."

On the Miocene Company's works, on the Horsefly, Cariboo, the shaft is down 400 feet, and Supt. Campbell is now driving out from the bottom of the incline to tap the bottom of the channel.

The Ashcroft Mining Journal states that hydraulic mining on the Quesnelle river is successful this year. The Bleson dredge working on that stream is bringing up gravel averaging 75 cents to \$1.50 per cubic yard.

LOWER CALIFORNIA.

Recently a waterspout struck Kaimalli and washed away 1500 tons of tailings from the Ibarra G. M. Co.'s mill. There were about 3000 tons in the pile and they were being worked by the cyanide process by Supt. Swayne on a private contract. The tailings averaged about \$12 per ton.

The Californian says that representatives of the Rose Cyanide Co., who operate an extensive plant on the Rose mine, Victor, Cal., are at Alamo examining the tailings accumulated at the various mines in that district and also the refractory ores in that section, particularly in the Jacalitos district, which may find a solution by their process.

MEXICO.

In his annual message to the Mexican Congress, Pres. Diaz says: "In the development of national industries, mining plays the chief part. The number of grants issued in the period of time that has elapsed since the date of my last report is 837, covering an area of 7820 pertenencias of one hectare each. The total number of grants issued under the existing law of June, '92, is 8313, covering an area of 63,353 pertenencias of one hectare each, showing that the number of mining properties located in six years is almost four times the number of those held when the law in question was promulgated. The development of the mining industry is further evidenced by the increase in the exportation of ore that has been observable for some time past. According to data published by the Finance Department with respect to the last fiscal year, the

total value of the mineral products of all kinds passing through the custom houses was \$91,350,000 in round numbers, showing an increase of \$10,500,000 over the value of similar products exported in the previous year. Silver figures among said products to the value of \$47,000,000; gold to the value of \$16,000,000, silver valuation; copper, \$4,700,000; lead, \$3,000,000; and, on a smaller scale, antimony, zinc, plumbago, coal, sulphur, asphalt, chalk and some other building materials."

Consul-General Pollard writes from Monterey: "There are two smelters in operation in the vicinity of this city, the larger having a daily capacity of 500 tons, which, in 1897, resulted in producing 7,076,544 ounces of silver, 23,830 ounces of gold (both Troy weight) and 22,912 tons of lead. The smaller smelter has a capacity of ninety tons daily. The larger has ten blast furnaces, together with the necessary appurtenances for their operation, while the smaller has six water-jacket furnaces of a capacity of ninety tons daily and three revolving furnaces of forty tons per day in the aggregate, with the necessary apparatus to operate them. The entire annual output of ore and constituents amounts to 112,000 tons."

"Assay offices are connected with each of these establishments. Twenty thousand tons of coke and 5000 tons of coal are annually consumed at the smaller smelter, and a proportionate amount at the larger. Of lead, 13,944,000 kilograms (30,740,942 pounds) were produced in the smaller smelter from May 1 to April 30, 1897-98, and 18,000 kilograms (39,683 pounds) of silver and 300 kilograms (661 pounds) of gold during the same period. From 400 to 500 men are annually employed at the smaller and about 700 at the larger smelter, the daily payroll of the latter being about \$1000 in Mexican money (\$452 in United States currency). Laborers at the smaller smelter receive from \$1 to \$5 daily in Mexican money (45 cents to \$2.26), and are paid weekly. Skilled labor is paid monthly. Salaried officers receive from \$100 to \$600 in Mexican money (\$45 to \$271) monthly."

"Both establishments do a large business with the United States, the products being shipped, and practically all supplies being obtained therefrom—the larger importing over 30,000 tons of coke during the year 1897. Smelting commenced here about 1891. It has increased each year since, and in view of the apparently inexhaustible supply of minerals in Mexico, it is only in its incipency."

"The names of the respective smelting establishments are La Gran Fundicion Nacional Mexicana and Cia. Minera Fundidora y Aguadora Monterey."

Near Cucurpe, Sonora, large veins of gold and silver ores are being developed by Americans, who are mining in the Magdalena, Arispe and Montezuma districts.

The San Ygnacio group of mines, near Ahumada, Chihuahua, yield good ores and will soon become shippers. They employ 100 men.—What are believed to be valuable deposits of copper ore have been discovered near Samalayuca, thirty miles from Juarez.

Commercial Paragraphs.

The Sullivan Machinery Co. of Chicago is now represented in Denver, Colo., by E. D. Hunter, at 332 Seventeenth St.

The American Stoker Co., through its Denver office, reports among its recent sales a full equipment of stokers for the ten boilers of the Portland mine, at Victor, Colo.

A NOVEL and improved form of miners' gold pan, recently patented, presents certain advantageous features which will be appreciated by miners. The first invoice of this new pan has been received by the Joshua Hendy Machine Works, No. 43 Fremont St., San Francisco, who have them for sale at \$1.50 each.

The Denver branch of the Jeansville Iron Works Co. has sold to the Moon-Anchor M. Co. of Cripple Creek, Colo., an electric pump, 600-foot lift, which is the initiative of electric power pumping in that district. Mgr. Middlebrook writes that he has an order from the Colorado Fuel & Iron Co. for a large electric pump for their mine.

32 FIRST STREET, SAN FRANCISCO, CAL.

THE GUTTA PERCHA AND RUBBER M'F'G CO.

30 and 32 FREMONT ST., SAN FRANCISCO.

Spadone's Concentrator Belts. Patented.

The "SPADONE" Curved Edge Concentrator Belt is attracting much attention among mining men, its merits appealing to the millman of practical experience.

Illustration (Fig. 1.) shows a cross-section, and (Fig. 2.) shows the edge hanging outwardly as it passes over the pulley. This relieves the strain from the top and bottom of the edge by directing the strain automatically to the inside face surface of the edges. Heretofore all belts have been so constructed that when they pass over the pulleys or rolls, a direct strain comes upon the top or at the base of the edges, causing the edges to break away from the body of the belts in a very short time. We avoid this Mechanical Defect by our Spadone Curved Edge. Belts made to fit any machine—4, 5 and 6 feet wide. Prices and samples on application.

FIG. 1.

FIG. 2.

WHITE, ROGERS & CO., Consulting Engineers and Millwrights,

OFFICE, 306 PINE STREET, - - SAN FRANCISCO, CAL.

Sole Pacific Coast Agents and Builders of the Celebrated

WILFLEY CONCENTRATOR.

The Wilfley Table is fully covered by U. S. patents Nos. 580,338 and 590,675. Infringements will be prosecuted to the full extent of the law.

PRICE, \$450. F. O. B., San Francisco.

Some Practical Reasons Why the Wilfley Concentrator Should Be Used in Gold Mills:

One of these machines will take the place of two or three belt concentrators of any style and do very much better work.

1. It will successfully handle three or four times more material than any belt Concentrator made, without exception.
2. It will save more sulphurets in proportion while so doing, and catch any float gold, amalgam or quicksilver which may escape from mortars or plates.
3. It will make cleaner and much more valuable concentrates, thus saving useless expense for transporting valueless material, as also extra cost for treatment.
4. It requires little or no attention when once adjusted and no expert is required to either adjust or run the machine.
5. It will save much expense in power and room, and the first cost of a mill requiring concentrators.
6. It has no expensive belts to crack and wear out, nor complicated machinery to keep in repair.
7. It is the only sensible plan of concentration, as any kind of material can be worked, which is not true of any style of belt machine.

CANTON STEEL COMPANY, Works : CANTON, OHIO.

CANTON EXTRA DRILL STEEL,
WARRANTED.

Canton Drill Steel is a strictly hammered steel made exclusively from one brand of stock which the experience of years has demonstrated to be the best for producing the greatest combination of hardness and toughness.

There is no mystery in the art of working it. Clean fire, clean water and the same good judgment employed in working any imported steel will produce the tough, strong bit for hard rock mining.

DEWEY, STRONG & CO'S PATENT AGENCY.

Our U. S. and Foreign Patent Agency presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American reports, with full copies of U. S. Patents since 1872. All worthy inventions patented through DEWEY, STRONG & Co.'s Patent Agency will have the benefit of a description in the Mining and Scientific Press. We transact every branch of patent business, and obtain patents in all countries which grant protection to inventors. The large majority of U. S. and foreign patents issued to inventors on the Pacific Coast have been obtained through our agency. We can give the best and most reliable advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and circulars free.

CIRCLE RAILROADS,In Connection with the Denver & Rio Grande.
For information, address
C. F. ELLIOTT, General Traffic Agent,
DENVER, COLO.**GOLD IN COLORADO!**Colorado has within its limits some of the great-
est gold mines that has ever been discovered. In
Cripple Creek in 1892 there were a few prospectors
looking over the hills; in 1895 the camp turned out
over \$8,000,000 in gold. Leadville, the old bonanza
camp and the mineral product of which made Den-
ver what it is to-day, is becoming a big producer of
gold. New inventions for working low-grade gold
ores, together with the discoveries made to work
rebellious ores, have opened up a field for the min-
ers such as they have never enjoyed before, and
Colorado has inducements to offer such as no other
district in the world possesses; the record of the
State in gold production for the last three years
speaks for itself. Among the other prominent
camps in the State are Telluride, Ophir, Rico,
Silverton, Mineral Point, Durango, La Plata,
Ouray, Saw Pit, Ironton, the Gunnison district and
many others. New finds are being made and new
camps are springing into existence every day.
The Denver & Rio Grande Railroad, which is the
pioneer road of Colorado and which has always
been the miner's friend, reaches all the mining
camps in Colorado. For elegantly illustrated
descriptive books, free, of mines in Colorado

Correspondence solicited.

This cut illustrates our 4 H. P. to 8 H. P. HOISTING PLANT. Larger sizes built to suit the demands of our customers.

It is strong and exceedingly simple and durable, being entirely under the control of the operator, by the use of a single hand lever for hoisting, while the lowering is governed by a foot lever and brake. No better device has been designed for this purpose. For prices and further information address the builders.

Assessment Notices.

EUREKA CONSOLIDATED DRIFT MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Forest Hill, Placer County, California.
Notice is hereby given, that at a meeting of the Board of Directors, held on the 12th day of September, 1898, an assessment (No. 13) of one-half cent per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, Nos. 1209-11 Claus Spreckels building, San Francisco, California.
Any stock upon which this assessment shall remain unpaid on the 10th day of October, 1898, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on TUESDAY, the 1st day of November, 1898, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.
By order of the Board of Directors,
J. J. CRAWFORD, Secretary.
Office—Nos. 1209-11 Claus Spreckels building, San Francisco, California.

MARINA MARISCANO GOLD MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Sunny Hill, Shasta County, California.
Notice is hereby given, that at a meeting of the Board of Directors, held on the 24th day of September, 1898, an assessment (No. 15) of 2 cents per share was levied upon the issued capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 217 Sacramento street, San Francisco, California.
Any stock upon which this assessment shall remain unpaid on the 31st day of October, 1898, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 21st day of November, 1898, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.
By order of the Board of Directors,
CHARLES BOYNE, Secretary.
Office—217 Sacramento street, San Francisco, California.

JUNCTION MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Tuolumne County, California.
Notice is hereby given, that at a meeting of the Board of Directors, held on the 1st day of October, 1898, an assessment (No. 21) of three (3) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the secretary, at the office of the company, 106 Leidesdorff street, San Francisco, California.
Any stock upon which this assessment shall remain unpaid on the 7th day of November, 1898, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 28th day of November, 1898, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.
By order of the Board of Directors,
CALVERT MEADE, Secretary.
Office—106 Leidesdorff street, San Francisco, California.

MARGUERITE GOLD MINING AND MILLING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Auburn, Placer County, California.
Notice is hereby given, that at a meeting of the Board of Directors, held on the 3rd day of October, 1898, an assessment (No. 11) of 10 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the secretary, at the office of the company, 237 12th street, San Francisco, California.
Any stock upon which this assessment shall remain unpaid on the 7th day of November, 1898, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 5th day of December, 1898, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.
By order of the Board of Directors,
F. METTMANN, Secretary.
Office—237 12th street, San Francisco, California. The Secretary will also receive payments from 12 to 5 P. M. at his business office, 225 Sansome street.

DELINQUENT SALE NOTICE.
